mark of buildings ably planned, subservient to the needs and customs of the people.”

Thus it was the *élite* of the craftsmen that supplied the material from which the old master builders arose. They were men who by natural ability and skill in their craft had raised themselves to a position above the workman. By a process of natural selection or “survival of the fittest” among them the few came to be architects. This is a rather different thing to asserting, as some have done, that the designing of buildings can be intrusted to everyone who can handle tools. Nothing is less true to fact. The old craftsman who became master-workman or “surveyor” was one who, had he lived in these days, would probably have won a name in the profession. In his time he won a leading position at building among his fellow-craftsmen. He united both the faculties to a certain degree. To a mason or an artist craftsman in some trade he united a certain amount of tact and common sense. Circumstances in those days favoured his promotion, because there was a natural competition amongst skilled men; but it is not so in these days. The mischief now is that the man may be an artist, and also one of skill, and yet cannot rise. Increase in numbers does not account for the fact; much more must be attributed to capital, favourable circumstances, individual qualities. With these a man possessed of very ordinary abilities gets on. A wide difference exists between preparing a design in an office and ordering it to be erected according to plans and specifications, and directing its progress personally step by step on the building itself. At a time when a man rose by degrees to be superintendent from the ranks of his own vocation, it would have been thought mad presumption for an outsider of the building crafts to dictate what should be done, and how a building ought to be designed. How great the change! The designing, controlling, directing is done from the outside by a class above the worker, the actual building by men who have no personal interest in the work. So the director-designing combination or agency of the present day has come about, and all is done by delegation. It has many advantages—economy of labour in the clerical work, speedier and more accurate draughtsmanship, special knowledge of buildings for varying uses, inception by men of a wider culture, more expert workmanship; but there is, on the contrary, no longer that close and direct relation between the construction as a matter of fact and utility and pleasing design. When the conceiver and the worker are separated, who can wonder if the building is a crude and coarse fulfilment of the artist's intention?

We said just now the analytic mind took things to pieces, while the man of synthetic tastes, the designer, delighted to combine and arrange and harmonise. These distinct habits exactly represent the scientific expert and the artist who look at things in different ways. Take, as an instance, the way an ordinary man of intelligence or a book-learned architect would regard an edifice. He would be more concerned with its dimensions, size, height, span, &c. If he was a man expert in construction he would be more interested in knowing the span and thickness of the vault than he would the arrangement of the ribs and the details of springers; he would work out the section showing diagram of forces; he would spend more time in examining and drawing to scale a timber or iron roof than he would in sketching its architectural details. For him facts are of more interest than effects or design or proportions.

The great want of connection in our buildings is one of the results of this mode of studying architecture—of the mode of analytical study. Our architectural and technical schools and courses, by sectional teaching, encourage this disjointed way of

studying design. For instance, they take materials, consider the properties, weights, and qualities of brick, stone, iron, and timber, but without making the student consider what all these properties mean in relation to design. If they make the novice an expert in answering questions on the crushing resistance, porosity, and working qualities of a particular stone, they think they have done all for him; but really they have only taught him the A B C of the subject. He knows as little as before as to how he should cut and convert or adapt the stone; how it should be applied; and of wood and iron and brick he only learns the physical qualities. Take, again, the subject of construction—the strength and stress of materials. The student is taught all the mechanical principles; but he is left entirely to his own resources when he has to design a vault, a buttress, or a timber or iron roof to suit a given building. He may have to draw to a scale a roof-truss showing its joints and connections; but all this may only make him an expert engineer or mechanical draughtsman. They are all so many separate and disconnected studies, and have no more to do with design or particular buildings than a knowledge of the rules of grammar can make a man a good prose writer, or a knowledge of descriptive anatomy can make a physician. These disjointed studies may enable a youth to get a high number of marks, but they will not enable him to design a cottage well. The results of this mode of teaching architecture is seen in our buildings. It makes technical graduates, but not designers.

A. designs a roof on mathematical principles though it is extremely ugly, while every detail has been studied carefully; it has no connection whatever with the rest of building. The corbels which carry the ribs on the wall are left to the fancy of the mason. B. has been very careful to make his stone pillars strong enough to bear the weight, and to design the details of his arcade according to the rules of a particular Gothic period, but they are either coarse or extremely weak. He has simply applied what he has been taught, and designed details that are only suited to a cathedral. C. designs a water tower from an engineer's point of view; but the tank of iron is atrociously united to the brick tower. These are only a few of the ways in which the modern scholastic ideal of architecture fails. The mason and carpenter period of the art was saved from these crudities and errors. But we have to look at things as they are. We cannot again hope to return to the age of a craftsmanship architecture; but we can do something to restore the connection which was severed in the 16th century. A few are striving to make architecture again what it was, the result of a combination of crafts, by making masons and carpenters directors of building, and educating the architect in trade schools. We doubt whether such a state is again practicable; but we can do much to make the architect better understood by the workman. His main position now must chiefly be that of a director, and his function that of arranging and combining. He need not trouble about details of trades, or be an expert in handling tools, but he can be taught to draw details that are reasonable and intelligible, and so to avoid the habit of designing out of his head in materials which he knows little about, and save trouble to those who have to torture them into shape. One writer says that ultimately the large crafts will reabsorb the architect. This is hardly probable under existing circumstances. What is more desirable is to secure him against further division and detachment from building.

THE INTERNATIONAL CONGRESS OF ARCHITECTS ON ARCHITECTURAL EDUCATION.

THE International Architectural Congress of Architects has been holding its meetings at Brussels during the week. Organised by the Société Centrale d'Architecture of Belgium, a body of enlightened and independent views, there is no doubt the deliberations of the members of the congress will have their due weight. One of the most important questions on the programme we see is "Instruction in Architectural Art: Should it be Eclectic, or should it be Limited to the Principles of a School?" Here a challenge is thrown down to all who have theories to bring forward. For the real architect, who has a conscience and endeavours to discover a *raison d'être* for his position, which has been declared rather untenable, this subject will provoke interest. Of course, we know there are hundreds in the profession who care not a sou about the subject, who regard it as a question far above the needs of practical men, and to whom the discussion of architects' remuneration would be more to their taste, or the three last questions in the programme. To these men all educational subjects are distasteful.

As to what will be said on this first subject, we can form little opinion now; but there will no doubt be many champions for the theory that instruction in architecture should be eclectic, and not confined to one school. The modern architect has been brought up in the eclectic school: he likes to exercise his taste in selecting a "style," a bit from this building and a bit from that, or, as it has been nick-named, to follow the "bib-and-tucker" system of design; it is easy, and accommodates itself to various purposes;—the house or shop can be of Renaissance, the church or schools Gothic, the baths Alhambra-esque, and so on. To limit oneself to the principles of a school may do very well for a few; but not for the man who caters for popular suffrages. Of course, such a reason will not commend itself to the real artist, who regards architecture as building, or the result of the craftsmanship of the age to special ends; who says, in short, there is no such thing as a modern style, but that each designer or workman must impress his own meaning. In another article will be found some remarks bearing upon this topic. It would be well to remind the reader of the theories that now obtain. First, there are those who say that the study of architecture is a matter of learning different historic styles, and applying them as best they can with more or less modification, which class form the larger class of the profession. Second, those who say there is no such thing as architecture apart from building; that we can give the title of architecture only to buildings which can be dressed up in historic styles; third, those who have some theory of design, as, for instance that propounded by M. Leopold Eidlitz. The first theory is, of course, based on learning the styles, and may be called, therefore, the scholarship idea, which has existed in one form or another ever since the death of living architecture in the 16th century. All that we are at present is due to the scholastic view of art. Genuine architecture, the result of "experimental workmanship with tradition behind and reason in front," as Mr. Lethaby says, ceased entirely, and then it was an "essay in *vrai* architecture" in which scholars and amateurs dabbled, as well as architects. It is this "scholarship" theory of architecture that we have most to break away from: it is curbing invention—or rather suppressing it—and is likely to last so long as there are any old styles to borrow from. As to instructing students in architecture, the question is one of immense importance. On this system, the

student must be a scholar in styles if he would succeed. He must look upon Classical antiquities and Mediaeval traditions as the very groundwork of architecture, and regard them with as much importance as the scholar of language would Greek and Latin. But on rational grounds, such an academical course is not to be recommended. Viollet le Duc, Eidlitz, Fergusson, Veron, and others have all denounced a method of instruction founded on dead styles. The building, as a specialised product for a given end, an organic structure in which every requirement and condition finds its suitable expression, must be the basis of any intelligent study. The "architecture" of such a building must be developed from within outwards, it cannot be borrowed or imported; in a word, it must be the development and expression of function. The academical theory of educating the architect is, on philosophical grounds, a decided mistake; but the difficulty is in finding a substitute. The remarks of Mr. W. R. Lethaby in a paper read at the International Congress on Technical Education have a bearing on the question. The author traces the origin of the breakdown of architecture to the 16th century, when Roman law and art overthrew the guilds of craftsmen; and the substitution of the scholarship ideal. Before this time, the guilds of workmen were bound up with religious brotherhoods, and with the corporate life of the municipalities; but the revolution struck at them all, and in their place "a set of drawing masters, designers, commercial travellers in art" flocked from Italy, and "hung about the courts of France, Germany, and England." These "drawing master" designers were chiefly painters, and hence the architect became to be regarded as a "drawing master" of buildings rather than a graduate of the shops. These terms adequately describe the class of men who became the ancestors of the modern architect. The same writer refers to the disappearance of the body of workers which the earlier masters like Wren had to deal with, which body is fast decaying, and he refers to the value of the old guilds and the need of establishing schools in which the workman and the architect can be instructed. No one can seriously dispute the value of properly-constituted schools or guilds for craftsmen and architectural students. It is true, also, that professional and literary education is defective: it relies too much on conventional lines, rules, and formulae, and is apt, as we are told, to "run to grammar," as the English system of teaching languages. The question "What should be the programme?" will not be answered till we bring the worker into association with the professional man. Then only can a series of questions or exercises be framed of value to the student of building.

Of the other papers to be read and discussed we can say little now. The second subject is the old question as to the value of a diploma—"Is an architectural diploma necessary?" After what we have said, we should say no student will value a diploma which is not a guarantee of architectural skill. The third subject, Restoration, is of more practical interest. It is briefly the right of an architect to correct the mistakes or alter the construction of the original builders; to finish unfinished parts of the building, like completing a tower of an old church. The right of an architect to interfere with another man's work is a delicate and moot point. Why not? The old architects had no such scruple in adding to, pulling down, and altering another's work. But there is a professional sense of etiquette in modern procedure which we cannot quite understand. The other two questions have reference to the ownership of designs—"What steps should be taken to insure architects' proprietorship of their designs?" The difficulty would be sometimes to say what was really original in a design. The last question, as to

PROPOSED CATHOLIC INSTITUTE & ASSEMBLY HALL—FAIRFIELD—HEBDON BRIDGE FOR FATHER TILLMAN. W. WIGLEY ARCHT. HEBDON BRIDGE.

the need of establishing a fund to protect architects, is one that may be profitably discussed in the interests of the profession. Such a fund would enable architects to claim their rights against exacting boards, and assist them to ventilate their grievances in competition awards.

ASSEMBLY HALL, ETC., HEBDEN BRIDGE.

THIS Hall is in course of erection adjoining the church and presbytery buildings recently erected. The walls are of random block insides, with local stone dressings. The plan shows the assembly hall only, under which there is a billiard-room, games rooms, baths, &c. The whole is being built at a total cost of about £900, exclusive of heating and furnishing. Mr. W. Wrigley, M.S.A., of Hebdon Bridge, is the architect for the work.

MECHANICAL COMPRESSION OF GROUND FOR FOUNDATIONS.

FROM the time of Chatmoss and before, architects and engineers have had ever before them the constantly-recurring difficulty of being compelled to erect important and substantial structures upon ground to which nature has denied the powers of resistance demanded of it by man. There are but three principles by which this want of resistance can be overcome, although each is susceptible of a large number of diverse applications. The supports, or, generally speaking, the foundations of the intended fabric may be carried down to a depth at which they will ultimately reach hard ground. Again, the area of the base may be so increased as to reduce the weight per unit of surface to an amount which the site can carry with safety. Both of these methods are expensive, and the latter is open to the objection that it can very seldom be employed. As a rule, the value of land is so great in districts where high and massive buildings are erected, that the adequate area, or rather the minimum area which can be made to

suffice for the purpose, is all that can be obtained. As an example corroborating our statement, witness the "giant buildings"—the "sky-scrapers" of the United States. There remains now the third principle to be considered, which consists in imparting a factitious resistance to the ground which it does not naturally possess. Several different processes and methods have been used to accomplish this desirable end. Our readers may probably recollect the description published in the columns of the BUILDING NEWS of the freezing process for consolidating loose and friable earth, and enabling it to stand a much greater unit pressure than when under its normal condition.

A new method, which may be termed the "Deluc" process, has been very recently introduced, and though it may be regarded as still passing through its probationary career, several structures built during the last year, upon foundations so obtained, have not evinced any signs of sagging, cracks, or other premonitory symptoms of incipient deformation. In a word, the *raison d'être* of the "Deluc" process is to be found in the fact that it effects a compression of the soil over as large a surface as is necessary, and to such a depth as may be required. The maximum depth at present attained is a little over 50ft., which was a work of considerable difficulty, and may be looked upon more as a successful trial of what the principle is capable of than as an example of what would often occur in actual practical work. In order to bring about the requisite degree of density or consolidation of the comparatively soft substratum, one or more rows of vertical holes, about 2ft. in diameter, are sunk at distances apart, varying from 5ft. to 7ft. from centre to centre, and subsequently filled up with almost any description of clean hard material, broken to convenient dimensions. Now comes the mechanical part of the operation, which consists in the method adopted for perforating the holes in the ground. For this purpose, a cast-iron ram, weighing about a ton and a half, of a prolonged conical form, and furnished with a steel point, is allowed to fall from a height of between 30ft. and 40ft., being hauled up after every blow by a sort of steam pile-driver running

on rails along a platform. In moderately soft ground, the depth of penetration attained at each fall will average about 15in., which will be sufficient to perforate a hole 30ft. deep in half-a-dozen hours. Experiments have shown that when the operation is concluded, even in banks of freshly-made earth, the hole so made will hold water at a constant level, so firm have the adjacent layers become.

When this preliminary stage is reached, a lighter ram, weighing a trifle under a ton, and with a much blunter point than the former, is substituted for it. First, however, the hole is filled with the material already described in successive instalments of a height of 18in., each height being well rammed as the filling proceeds. A third ram, of a truncated shape, and about the same weight as its predecessor, is used to test the results of the process. If, after a certain number of blows, there is no further sensible penetration, it is assumed that the consolidation has been successfully accomplished. The tops of all these piles, as they might be called, are then covered over with a platform of concrete, and the foundation for the future building is complete. It frequently occurs that a moderate degree of resistance will be sufficient, and the present process will enable that amount to be obtained, without incurring the expensive contingency of carrying the foundations down to solid rock or hard ground. Whenever, therefore, it is a simple case of consolidating the ground for only some 6ft. or 7ft., the conically-shaped ram is not used. The lighter and blunter specimen can do all that is necessary, and also it alone is employed when the earth is of a very soft, almost of a semi-fluid, description. Were the heaviest and sharpest pointed ram used in this case, it would go down too far, and might disappear altogether. A much smaller fall is given under these circumstances. It should be stated that there is one kind of substratum which defies all the efforts of the "Deluc" process. It is clay. When the depth of this material does not exceed 3ft., the conical ram can tackle the job; but when it has a greater thickness, some other means must be taken to overcome the difficulty. That once effected, the ram can be brought into useful

play again. The first application of this process was made, as might be expected from the name of the designer, in France, where the natural resistance of the soil was between five and six tons to the square foot. It is worth remarking that this method of securing good and solid foundations on hard ground was used in preparing the site for the erection of the large building which is to house the whole of the administrative staff of the Great Parisian Exhibition in 1900 at the Quai d'Orsay, not far from the bridge of Alma. The question of the comparative cost of the "Deluc" process will not be quite solved just yet, although it is stated that, by dispensing with all expensive timber piling, it ought to prove more economical, and also, what is equally of importance, save time and labour.

T. C.

SANITARY ASSOCIATION OF SCOTLAND'S CONGRESS AT DUNDEE.

THE twenty-third annual congress of the Sanitary Association of Scotland was held in Dundee on Thursday and Friday in last week. At the inaugural meeting on the former day, the chair was occupied by Lord Provost M'Grady, Dundee, hon. president of the association, who, in an address of welcome, contrasted the present position of Dundee with that in 1847, more particularly as regarded the ravages of typhus fever. In the latter year, he stated, with a population less than half the present, there were 1,033 cases; in 1865-66, when the population was 110,000, there were 1,084 cases; while since 1876, when the important improvements scheme of 1871 came into effect, the number of cases had never reached 100 in any one year. In 1895-96 the cases numbered respectively four and five, while during the present year, up till the end of July, only one case had been reported.

In the council's report reference was made to the passing of the new Public Health (Scotland) Act, in regard to which it was stated that although its provisions were not so comprehensive and far-reaching in some respects as the memorandum of the Association urged, it would do much to bring about improved sanitary conditions, and would give greater facilities to those intrusted with public health administration. Regret was generally expressed at the death of Mr. J. C. Stobo, sanitary inspector, Rutherglen, treasurer of the Association. The constitution was altered to read, that old members must have their subscriptions paid by first of August of each year, and in case of new members, within two months of their admission to the Association, or in the discretion of the council their names may be removed from the roll. An important alteration on the constitution was to the effect that sixty be the percentage of marks necessary to obtain a pass in the diploma examination of the Association. Hitherto the percentage has been fifty. Rothesay was selected as next year's place of meeting.

A paper was subsequently read by the President, Mr. Gilbert Thomson, C.E., Glasgow, on "Recent Developments in Sewage Purification." He said, while it would appear as if the future progress in sewage purification would be largely dependent on bacteriological research, the new methods had not yet so completely proved their superiority as to drive the others out of the field. There were still many competing systems full of vitality, and his object was not to advocate one or another, but to show the main lines on which recent advances had been made. Proceeding, he described and compared the three chief methods of treatment of the present time—on land, by precipitation and by bacteriological methods; and said the fact that they had not yet reached a final settlement of the sewage question was proved by the circumstance that within the last few weeks, as they had seen by the newspaper reports, works on each of the three leading methods to which he had referred had been adopted or recommended. This was, of course, so far due to the differences in local conditions; but it also suggested the probability that meantime there was so little to choose between the best representatives of the various systems, that causes more or less accidental might be sufficient to turn the scale in favour of any of them. Meantime, it might be said that, while no system could be definitely pronounced the best, they had, at all events, at command various processes which might be trusted to produce, if properly worked, a satisfactory effluent. But sewage still remained, and probably would remain, an element of expense

to any community, and to minimise that expense it was necessary that the system should be judiciously selected, the works skilfully planned, and, what was of the less importance, that the management should be careful and skilful. The public health aspect of sewage disposal was now fairly secure, and it might be hoped progress in the future would probably affect chiefly the financial aspect. Another aspect which was little considered when speaking of works in general, but which had an unpleasant habit of coming to the front very awkwardly, was the aesthetic one. Sewage works might be, and usually were, conducted so as to cause no actual nuisance; but if by still further improvement they could with some plausibility speak of the corporation aquarium, of the district committee's Jubilee ponds, an important, if perhaps indefinite, advance would have been made.

Baillie Dechan, Hawick, read a paper on "River Pollution," for the partial cessation of which injury to the public health of the country he said they were indebted to the Rivers Pollution Prevention Act, 1876. The present Act, however, was a weakening of a very pronounced type; but, like most things not understood, it was generally feared. The very fact that the consent of the Local Government Board was necessary before a sanitary authority could take proceedings had practically made the Act a dead letter. The Act was also the very essence of ambiguity, and the absence of definition made it almost hopeless for that progress which the altered conditions of our life demanded. It was very harassing and annoying indeed to local authorities, manufacturers, and others who might be responsible for allowing or causing pollution of a river, because these parties might incur considerable expense in their efforts to prevent pollution, which for the time being might be accepted as meeting the requirements of the case, and shortly afterwards be informed that the process adopted was, in the language of the Act, "neither the best nor only practicable and available means." Baillie Dechan contended that to obviate this feeling of uncertainty they were quite entitled to look to the recently-established Local Government Board for Scotland for instruction and guidance.

In the discussion which followed the reading of this paper, Mr. John Lindsay, interim Police Clerk, Glasgow, said the Rivers Pollution Act was of no use whatever, and remarked that it had failed absolutely and originally in the purposes for which it was intended. He thought the Association should set about getting an Act which really accomplished the primary purpose it was intended for. In the cases of river pollution brought under his notice he had found the Act to be absolutely of no avail, and even in the Public Health Act there was nothing to help them from a sanitary point of view. The only remedy he could get was to go to the Glasgow Police Act of 1866. It seemed to him a sad state of matters that for the prevention of the pollution of a river one had to go to a local Act of Parliament of thirty years ago to get remedies which in these days should be contained in a general and Imperial Act of Parliament.

Councillor Elliot, the Sanitary Convener of the city, read a paper on "Dundee, Old and New, judged from a Sanitary Standpoint," and, after discussion, the Congress joined in a drive from the Town-house to places of interest within the city of Dundee. In the evening the annual dinner of the Association was held in the Queen's Hotel.

On Friday, the conference was resumed in the Burgh Court-room, Dundee, the president, Mr. Gilbert Thomson, Glasgow, in the chair. Dr. Charles Templeman, the medical officer of health for Dundee, discussed the question of the prevention of disease by inoculative methods, in a paper which led to considerable discussion. Baillie John Tait, Kirkcaldy, read a paper entitled, "On the Trail of Typhoid," in which he dealt with two epidemics of enteric or typhoid fever which occurred in Kirkcaldy in 1896, and remarked that if a clause had been inserted in the Public Health Bill, making it imperative that those in charge of dairies should pass an examination, and receive a diploma of efficiency before being put in charge of a dairy, the Act would have been more effective. "Dairy Sanitation and Legislation" was the subject of a paper by Dr. T. G. Nasmyth, medical officer of health, Cupar-Fife; Mr. William Maclay, Glasgow, contributed a paper on "Protection Against Adulteration"; and Principal Dewar, Royal

(Dick) Veterinary College, Edinburgh, read another on "The Inspection of Meat."

At the annual business meeting, the following office-bearers were elected for the ensuing year: Honorary president, Lord Provost Henry M'Grady, Dundee; president, Gilbert Thomson, M.A., C.E., Glasgow; vice-presidents: A. K. Chalmers, M.D., medical officer of health, Glasgow; William W. Kelso, sanitary inspector, Paisley. Secretary and treasurer, George Middleton, M.A., LL.B., writer, Glasgow. Council: chairmen of health committees, Councillor Elliot, Dundee; Baillie Pollard, Edinburgh; Baillie Dick, Glasgow. Medical officers: Dr. Munro, Renfrewshire; Dr. M'Vail, Dumbartonshire; Dr. Ross, Dumfriesshire. Sanitary inspectors: Peter Fyfe, Glasgow; Duncan Cumming, Perth; W. Dunlop Brown, Rothessay. Burgh engineers and surveyors: William Mackison, Dundee; Joseph Potts, C.E., Partick. Elected members: Dr. Glaister, Glasgow; Baillie Miller, Partick; D. M. Alexander, Glasgow; Councillor Paton, Paisley; Councillor William Maclay, Glasgow; ex-Baillie Crawford, Glasgow; Baillie M. Dechan, Hawick. President-elect, A. K. Chalmers, M.D., Glasgow. Board of examiners: Dr. M'Vail, Dumbartonshire; Dr. Chalmers, Glasgow; Mr. Gilbert Thompson, Glasgow; Mr. William W. Kelso, Paisley; Dr. Duncan, Glasgow; Dr. Glaister, Glasgow; Mr. Peter Fyfe, Glasgow; Mr. G. A. D. Mackay, Edinburgh; Dr. Bannerman, Hawick; Professor Hay, Aberdeen; Mr. George Mackay, Perth; Mr. David Dunbar, Dumbartonshire. Secretary to the board, George Middleton. Parliamentary Bills Committee, the whole Council.

THE ORDNANCE SURVEY.

A REPORT of the progress of the Ordnance Survey to March 31, 1897, signed by Colonel J. Farquharson, the Director-General, is published as a Blue-book. It states that, while all cultivated districts in England and Wales were surveyed before 1890 on the 1-2500 scale, with the exception of Lancashire and Yorkshire, the plans for all the cultivated districts of Lancashire and Yorkshire have since been published. The revision of the maps on the 1-2500 scale was sanctioned in 1886, but the actual work of revision was not begun until 1894. This is attributed to the necessity of resurveying those counties which had been originally surveyed on the 6in. scale. Some delay was also caused by the revisions which had been in progress in London, Plymouth, Glasgow, and the Tyneside towns, but the 1-2500 revision has now been taken up in Middlesex, Essex, Kent, Surrey, Sussex, Hampshire, Buckinghamshire, Hertfordshire, Northumberland, Nottingham, Cheshire, Derbyshire, Glamorganshire, Durham, and Westmoreland. The area revised during the year 1896-97 was 4,623 square miles. The rate of progress, it appears, has varied greatly, progress having been slow where great changes have taken place, as in the neighbourhood of London, and relatively rapid in the agricultural districts. Publication of the revised plans is proceeding, and 3,567 square miles have been published during the year. It is estimated that the arrears will be made up by 1910, and the intention is expressed that after that has been done no sheet shall represent a survey or revision more than 20 years old. Maps on the 6in. scale have been published for all England and Wales. The new series 1in. map is published in two forms—(1) outline and contours, this map being now completed, and combined maps published also for Brighton, Derby, Gloucester, and Cheltenham, Plymouth, Nottingham, Chatham, and Winchester; (2) hill features, the publication of which will, according to existing arrangements, be completed in 1902. The experiment is being made of having some sheets of this map engraved by the trade in order to accelerate the progress of the work. The revision of the 1in. map is being carried out independently of that of the larger scale maps, and it is intended that all sheets should be annually brought up to date as regards railways, canals, and important public works. During the revision certain alterations are being made in this map so as to bring it more into harmony with military requirements without injuring its utility for civil purposes. At the instance of the War Office, an experimental 1in. map in colours has been prepared, by transfer of zinc, of most of the district south of the Thames, and the publication has been sanctioned by the Treasury. The revision of the map issued on the

A FRENCH BED OF THE SIXTEENTH CENTURY.

scale of four miles to an inch is to follow immediately that of the lin. map. The plans of all towns entitled to a large scale survey have been published, and the survey of London on the 5ft. scale has been revised and extended.

Details are also given in the report of the progress of work with regard to Scotland and Ireland and the Isle of Man. In the case of both Scotland and Wales the corrections of place-names which have been found necessary have been found to be comparatively few. Reference is made to the entire change that has been made in the system in force for the sale of the maps to the public. No comment is made on the degree of success resulting from this change, but the list of the total values of the maps sold each year show that, while from 1889 to 1893 the annual value varied between £13,000 and £13,700, increasing to £14,903 in 1894 and £15,497 in 1895, the amount reached £17,715 in 1896-97. Index maps are appended to the report showing the periods which have elapsed since the dates of the surveys of the various counties, and other particulars as to revision and publication.

FRENCH BED OF THE SIXTEENTH CENTURY.

THIS handsome couch of the four-poster type is a fine example of the refined work done in France towards the end of the 16th century. Most of the members of cornice and of the sides and end of bed are carved with varied enrichments. The four posts are also richly ornamented with fluted columns, terminated half-way up by caps of a Composite description. The bed is kept well off the floor by feet.

RESERVOIR DAM PROFILE.

THE value of curved dams on plan has received much attention from engineering experts. The Aqueduct Commissioners to the Quaker Bridge Dam, in their report on the design of the profile, speak favourably of the value of the curved form for a narrow deep gorge, as its arched action comes into play. They say: "If the radius is short, the cross-section of the dam may be produced below what is termed the gravity section, meaning thereby a cross-section or profile of such proportions that it is able, by the force of gravity alone, to resist the forces tending to overturn it, or to slide it on its base at any point." Even if of long radius, the curved form is said to prove an advantage to masonry construction. The curved form is also more pleasing to the eye than the

straight, and satisfies the mind as to the stability, and should be preferred. The conclusions led the experts to recommend the adoption of a certain profile in a curved plan with radius of about 1,200ft. Mr. C. F. Courtney, in his work on "Masonry Dams," noticed last week, lays down the following conditions as to stability:—(1) No part of the masonry must be in tension; (2) no part of the structure must be under more than a certain pressure from the superincumbent weight; (3) it must by friction alone resist any tendency to slide on its base; (4) it must by its own weight alone be able to resist all tendency to overturn by water pressure, or the pressure of uneven winds, &c; (5) there must be such a width given to the top as to counteract the effects of expansion and contraction." Prof. Rankine points out that theoretically if the limits of pressure fall outside the centre-third of the profile the structure is exposed to tension; the line of pressure therefore falls within the centre-third, for if the requirement as to tension be fulfilled, conditions 2 to 4 are complied with. By aid of the graphic process a number of trial profiles can be drawn, till one be found that will give the required lines. Those who are engaged in sections of this kind will find the formula given by Mr. Courtney for ascertaining the theoretical profile of service. It is fully worked out in figures, and the author says it meets rigidly the requirements of stability. The detailed calculations of a masonry dam, 100ft. high, is given in tabular form. The formula gives a profile of polygonal outline which is quite accurate enough for practical purposes.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—I.

By AN ASSOC. INST. ELECT. ENGS.

INTRODUCTION AND SCOPE.

THE lighting of buildings by means of electricity has developed to such an extent that it is now important that architects, clerks of works, and all who deal with specifications of buildings, should have some acquaintance with the fundamental principles of this system of lighting; and, believing that those who neglect this branch of building design will have cause for regret, this series of papers has been prepared to give students and others a general idea of the principles involved, and, by explaining everyday terms, and the various systems and devices adopted in practice, to provide an introduction to this branch of electrical engineering, so that advantage may be taken of the standard textbooks and journals

dealing specifically with electric lighting problems. And, whilst it is not expected that architects should become electrical engineers, it is not too much to hope that they may possess such a knowledge of electric lighting which will enable them to work intelligently with the electrical engineer when circumstances demand joint responsibility. At the same time there are many cases, especially with private installations, when much preliminary work may be undertaken by the architect, whilst in all cases an acquaintance with the principles of electric lighting cannot but be of use to him.

To make the series complete it will be necessary to deal first with some elementary facts relating to electrical energy, and to introduce and explain such terms, units, and laws as must of necessity frequently occur in these articles. And here it may be observed that, when we explain electrical phenomena by means of comparisons with other better known phenomena, the analogy given must be limited to the statement made, and must in no case be taken to apply to other electrical phenomena.

Our subject naturally divides itself into three parts: (1) electrical energy and its production, (2) its distribution, and (3) electric lamps and light. The generation of electricity, important as it may be to the electrical engineer, is, to some extent, outside the province of the architect; consequently, it will receive only passing notice, due prominence being rather given to distributing arrangements of a permanent character, so that efficiency, durability, and security may be attained.

However interesting it might be, we must pass over the consideration of the purely physical phenomena connected with our subject, and consequently can only say a few words about electricity *per se*. To be concise, we may say that electricity is one of the mysterious forces of nature, and, like heat and light, it may be defined as a form of energy; and, although it is convenient and usual to compare the transference of electricity along a conductor to the flow of a fluid in a pipe, there is nothing materialistic in its nature, and the comparison is purely and simply arbitrary; as a matter of fact, its innate nature is beyond our present knowledge. We know how to produce it, and also how to use it; and we shall assume that it is common knowledge that certain effects are always produced, and always accompany the transference of electricity from one point to another. In electric lighting, for instance, the heating effect of an electric current is utilised to produce light, and, in fact, speaking generally, the existence of a current of electricity can only be recognised by the effects it produces. It is also remarkable that these effects may be concentrated to any degree and wherever they may be required, and it is in consequence of this that electrical energy is of immense practical value.

We shall also assume that everyone knows that electricity may be produced in a variety of ways, i.e., by friction, by chemical and by mechanical means, and that in each case the substance electrified is capable of doing work; in other words, electrification is accompanied by the production of energy. Electricity, produced by means of batteries (chemical means), is suitable for experimental and signalling purposes, whilst for commercial undertakings on a large scale, electricity is produced by mechanical means, and we have for lighting purposes to depend upon the dynamo as a generator of electricity; presently, we shall have to deal in a very brief manner with different types of these generators and generating stations. Before, however, we can make much progress with our subject proper, it is very important that we should have a thorough grasp of those factors which comprise an electric circuit; the first of these—current and its unit, the ampère—will now be considered.

CURRENTS OF ELECTRICITY—THE COULOMB—THE AMPERE.

Commercially, we are concerned mainly with electricity in motion, and, in ordinary parlance, we speak as if electricity were passing or flowing along a conductor, just as water flows along a pipe, and it is from this arbitrary notion that we get the idea of currents of electricity; and, when we remember that the word current means simply rate of flow, we shall understand that the term current of electricity means rate of flow of electricity. And, just as we can measure the rate of flow of water, so we can measure currents of electricity, and in definite units, too, great care

having been taken to arrange a comprehensive system of electrical units. The system of units was legalised by the Board of Trade in 1894, and the student cannot pay too much attention to the study of electrical units and standards. The unit quantity of water is the gallon, cubic inch, or cubic foot, whilst the unit quantity of electricity is termed the *coulomb*. The unit rate of flow of water is the gallon per second, cubic inch, or cubic foot per second, as the case may be; similarly, the unit of an electric current or unit rate of flow of electricity is the coulomb-per-second, or *ampère* as it is called.

These units are defined by the Board of Trade as follows:—The coulomb or unit quantity of electricity is that definite quantity which, when passed through a solution of nitrate of silver in water, deposits 0.001118 of a gramme of silver. The ampère is the name of unit current, and is that unvarying electric current which, when passed through a solution of nitrate of silver in water, deposits silver at the rate of 0.001118 of a gramme per second.

We thus see that a current of electricity of an ampère's strength does a definite amount of work per second, this unit conveying the idea of rate of transfer; as an example, we may mention that many glow-lamps (120 volts.) give 16 candle-power of light when supplied with electricity at the rate of half a coulomb per second—that is, with half an ampère. Currents may be measured in a variety of ways, the commercial instruments for measuring ampères being termed *ampère-meters* or *ammeters*. These we shall consider when dealing with equipments; for very small currents a secondary unit, one-thousandth part of the ampère, and called the *milliampère*, is used in practice.

CONDUCTION OF ELECTRICITY—ELECTRICAL RESISTANCE AND ITS UNIT, THE OHM.

The idea of electricity being in motion implies some conducting channel, and the whole path traversed by electricity is said to form an electric circuit. As we have already inferred, some metal in the form of wire is generally the medium by means of which electricity is transferred from one point to another, and it is an advantage when an electric circuit consists of a material, or materials, which allow electricity to pass easily. Materials that do this are called *conductors*, and since conductors vary greatly in their conducting powers, it is very important to know the degree in which conductors differ in this respect. This statement implies obstruction to a greater or less extent to the passage of electricity, and it is because of this obstruction that the magnitude of currents to a certain extent is limited. This property of conductors, obstructing and limiting the quantity of electricity passing through a circuit is analogous to friction, and is termed *electrical resistance*. Resistance, then, may be defined as the obstruction which electricity encounters when traversing a conductor. A good conductor offers little resistance, whilst a bad conductor offers so much resistance that it is often used to confine the electricity along a definite channel; it is then termed an *insulator*. All substances, however, conduct electricity more or less, and, whilst there is no substance which offers no resistance, there is no material known which obstructs the passage of electricity absolutely, nor is there any clear dividing line between conductors and insulators.

Since the magnitude of a current of electricity is limited under certain conditions by this obstruction offered by conductors, it is obvious that the resistance of conductors plays a most important part in the distribution of electricity for commercial purposes, and in practice we often require to compare and measure the resistance of conductors with great accuracy; consequently, a standard is required, and a suitable conductor of convenient form, given dimensions, and definite physical condition, has been chosen, the electrical resistance of which is the unit of electrical resistance known as the *ohm*. The Board of Trade specifies that the ohm, the unit of resistance, shall be that resistance offered to an unvarying electrical current by a column of pure mercury, 106.3 centimetres long, and of a constant cross-sectional area of one square millimetre at the temperature of melting ice. Very often a symbol—the small Greek letter omega, ω —is used as an abbreviation for the term ohm. Thus, 10^{ω} means 10 ohms.

The factors which individually and independently affect the resistance of a conductor are the dimensions, the material, the temperature, and physical condition generally.

Now, just as a long pipe offers more resistance to the flow of water in a pipe than a shorter one of the same diameter, so the resistance of a conductor to the passage of electricity is directly proportional to the length. Increased length gives increased resistance. The resistance also varies inversely as the area of the cross-section of the conductor. Doubling the area of a conductor allows twice the number of ampères to pass, other things remaining the same; in other words, the resistance is halved. Algebraically—

$$R \propto l \text{ (resistance varies as the length)}$$

$$R \propto \frac{1}{A} \text{ (resistance varies inversely as the area)}$$

Combining these expressions, we get—

$$R \propto \frac{l}{A} \dots\dots\dots (1)$$

where R = resistance in ohms, l = the length in centimetres, and A = area of cross-section in square centimetres.

Again, with a pipe of given dimensions the quantity of water flowing through it, under given conditions also depends upon the material and the nature of the inside surface of the pipe, and in a similar way electrical resistance varies with different materials and their physical conditions; in other words, resistance is a physical property of the conductor itself. And, since this physical property, electrical resistance, varies with different materials, the resistance of a mass of known volume of the various materials in a definite form is accurately determined. To do this a centimetre cube—a cube each side of which is one centimetre long—is interposed in an electric circuit, and the resistance offered to the passage of electricity between two opposite faces of the cube at a temperature of 0°C . is found in terms of the ohm. This resistance when exactly determined is of the nature of a constant, and is known as the specific resistance or resistivity of the material. As the specific resistances are very small quantities, it is more convenient to express the resistivity of a material in microhms (millionths of an ohm). Thus the resistivity of a sample of nearly pure copper was found to be 0.000001561 of an ohm, or 1.561 microhms.

Usually the Greek letter σ (Sigma) is used to denote the specific resistance or resistivity of a substance; so that—

$$R \propto \sigma \dots\dots\dots (2)$$

And, combining this with the expression given in equation (1), we obtain the relationship between the resistance, dimensions, and material of a conductor—i.e.,

$$R = \frac{\sigma \cdot l}{A} = \frac{\sigma \cdot l}{\pi r^2} = \frac{4\sigma \cdot l}{\pi d^2} \dots\dots\dots (3)$$

which enables us to calculate very readily the resistance of a conductor; r and d are the radius and diameter respectively.

Again, the resistance of a conductor also depends upon the purity of the material, the degree of hardness or softness, &c. Also, when the material of a conductor is an alloy, its resistance is always higher than that of the individual metals forming the alloy. It will not be out of place here to point out that the magnitude of the current itself does not exert any influence upon the resistance of the conductor through which the electricity is passing, except in so far as it changes the physical state of the wire—as, for instance, by raising the temperature of the wire. The effects of these changes will be considered in detail later on.

It will no doubt appear strange that, whilst high conducting power is considered the essential property of a conductor, a unit of the negative or converse property has been chosen for purposes of reference, instead of a unit denoting the facility with which a material permits the flow of electricity. For some problems, however, such a unit is desirable, and is often used in calculations. Now, the property which a substance has for conducting electricity is termed "*conductance*." Conductance is the converse of resistance, and is measured in terms of a unit which is the reciprocal of the ohm, the unit of resistance. This unit is termed the *mho*, an inversion of the word "*ohm*"—that is, *mho* is *ohm* written backwards. The *mho* is the conductance of a column of mercury 106.3 centimetres long and 1 square millimetre in sectional area at 0°C , and it is evident that a conductor of R ohms resistance will have a conducting power of $\frac{1}{R}$ mhos. Conductance, then, is determined by dividing unity by the resistance in ohms. On

account of its high conducting power, copper is used almost universally for conducting cables.

As is well known, electricity for lighting purposes has often to be carried considerable distances, and consequently whilst conductors should have little resistance that they may form an easy path for the electricity passing, it is at the same time essential that means should exist for confining the electricity in a definite path; otherwise it will be found that it is the nature of electricity to take shorter paths so as to complete the circuit in a way not to be desired. Nature fortunately provides us with a plentiful supply of both conductors and insulators, giving us a large variety of materials which differ widely in their conducting powers, so that by making a judicious selection from these materials we are enabled to use conductors permitting electricity to flow easily, and at the same time to inclose the conductors with insulating materials or insulators, giving us unlimited control over the current and the path, so as to prevent leakage, waste, and danger.

Insulating materials are those which have high resistances, such as dry air, glass, porcelain, stoneware, slate, mica, ebonite, shellac, paraffin, resin, and bituminous compounds, oil, india-rubber, guttapercha, paper, cotton, silk, and wood. The specific resistances of these substances are so high that we express insulation resistances in terms of a secondary unit, one million times the size of the ohm, which is termed the *megohm*. One megohm equals 1,000,000 ohms. The symbol for megohm is the capital (Greek letter) Omega, Ω . Thus 100Ω means 100 megohms. The insulation resistance, for instance, of a thoroughly well-insulated cable used in electric-light circuit varies from 200,000,000 to 5,000,000,000 ohms per mile—that is, from 200 to 5,000 megohms per mile.

The megohm-mile is a unit of resistance denoting the average insulation resistance of one mile of insulated cable. Insulation resistance decreases with length of cable and increases with thickness of covering. It varies considerably with atmospheric changes, and changes in temperature, decreasing greatly with increase of temperature and addition of moisture. In the proper place we shall deal with different types of cables and methods of insulating the same, and shall give directions for using the right kind for the various purposes for which they may be required.

(To be continued.)

CONSTRUCTION OF ARCHES IN CONCRETE.—XI.

WE shall now pass on to review the experiments and tests carried out upon arches constructed of different materials, but having the same span and other details in common, so far as the circumstances and conditions of each case would permit. These tests are particularly interesting and valuable, inasmuch as the length of the span of each description of arch was 76ft., a dimension which raises them far beyond the amateur or toy phase, and places them in the rank of practical working structures, and thoroughly fit to do their duty as road or railway bridges. One great desideratum when subjecting the arched type of construction to actual tests, and those of a severe character, was fortunately secured—that is, a firm and solid stratum to build the points of support upon. The examples selected for the experiments we are about to describe were five in number, and were constructed respectively of stone, brick, ordinary well-rammed concrete, Monier cement on the compound system, and of steel. The loads were composed of old rails, piled up in gradually successive layers or tiers, commencing at one point of support, and carried up to the crown of the arch only, so that they were distributed uniformly over one half of the span. It is obvious that this condition could only obtain in practice when the rolling load was advancing across the arch; but, as this arrangement tries its powers of endurance and resistance to the maximum limit, it constitutes a very suitable and appropriate standard according to which to dispose the loading. It should be kept in view that in the arch, as well as in every other similar constructive design, it is not the absolute amounts of the dead and moving or live loads, regarded separately, which chiefly affect the resulting stresses, but the proportion which exists between them; in other words, the greater the disproportion or discrepancy between their respective amounts the more disadvantageously do they affect the structure when the greater

loading is on the live side. When a bridge reaches a very large span its dead or insistent weight becomes of such magnitude that the rolling or live load may be practically neglected. It would, in fact, produce no more effect upon the bridge than would a bluebottle fly walking across a 3in. plank.

A reference to Fig. 1 will show the manner in which the arches were supported and the platform erected upon which the numerous tiers of rails were accumulated. Underneath the arch, which is represented in skeleton elevation in Fig. 1 by the curved line A B, five masonry pillars were built, corresponding to the odd numbers 1, 3, 5, 7, 9 in the elevation. Each pillar was 3ft. 4in. by 7ft. 6in., and carried all the temporary scaffolding and centring. In order that the uniform distribution of the load should be completely guaranteed, a platform a b—f was built on the top of the arch. The platform was supported by six steel pillars upon small pedestals, raised about 1ft. above the level of the arch, and strongly braced together by diagonal struts and ties; the total weight of the platform and pillars amounted to 15 tons. In proportioning the dimensions of the steel pillars it was estimated that a load of two tons per square foot would not exert a correspondingly greater stress upon them than six tons per square inch—a very fair margin for good mild steel.

Of all the arches tested of the span of 76ft. that constructed of brick proved to be the weakest and the strongest, but we must not anticipate. We shall commence with the weakest, an elevation of which is given in Fig. 2, and a transverse section through the crown in Fig. 3. The principal dimensions, which will answer for all the bridges to a certain extent, are span=76ft. rise=15ft. radius of intrados=55ft. The width of the arched rib was 7ft. 3in., the depth at the crown 2ft., and at the springings 3ft. 6in. Machine-made bricks were used throughout, and when subjected to separate preliminary tests evinced a very remarkable degree of strength and excellence. The arch was turned in Portland cement mortar, mixed in the proportions, by volume, of one part of cement to two and a half parts of clean, hard, sharp sand. About one-third of an inch was allowed for the joints, and, without entering into further details, it may be stated, once for all, that no precautions were neglected to insure the best materials and first-class workmanship. The arches of bricks and of stone were erected parallel to one another at a distance of 27ft. apart, from centre to centre; both were allowed to remain *in situ quo* upon the centring for six weeks subsequent to their building before the experiments were commenced. As it was especially important to detect and register the incipient signs of the smallest cracks when the centres were "struck," the faces of the arches were coated with a thin layer of fat lime. It was not until a load amounting to 43 tons was placed, uniformly distributed over one-half of the arch, that cracks began to come into evidence. They first appeared at a distance of about 5ft. from the springing of the loaded half of the arch, were of quite insignificant dimensions, and, what is somewhat singular, had their origin in the extrados of the arch. When the load was increased to 57 tons, which is equal to 0.25 tons per square foot on the half span, the number of the fissures increased, and spread themselves over the whole width of it. At this

stage of the trial the load was removed, and the result that followed deserves to be noted. It was observed that the fissures completely closed up, but, at the same time, the arch did not return to its normal contours, thus clearly demonstrating that it had undergone, however slight, permanent deformation, the maximum deflection amounting to $\frac{1}{4}$ in. Upon reloading the half-arch as before, the following facts were recorded:—Not only was there a large increase in the previous deformation, but the old cracks reopened, accompanied by others, which continued to augment, both in number and magnitude, until the point of failure was attained; which occurred when the total load was raised to 1.7 tons per running foot. Contrary to what generally occurs in similar experiments, the rupture was not of a violent, nor of an exceptionally sudden character, but took place in a very gentle and gradual manner. At the time of failure the maximum deformations or deviations from the original position of the axis of the arch amounted to 1.2in. measured in a vertical direction, and to 0.82in. when measured in a horizontal sense—that is, the maximum deflection under the breaking-load is given by the former dimension, and the greatest lateral displacement by the latter. It would appear that the failure of this example was due, not so much to any weakness in the resisting powers of the bricks, as to that of the mortar. The fissures, which extended along the whole width of the arch, were found to follow very closely the line of the joints, which tends to indicate that they were more or less separated by the tensile stresses acting upon them. On the other hand, the bricks yielded only at one point, situated at a distance of nine or ten joints from the springing of the unloaded half of the arch. The actual point of final breaking occurred at the section, *xy*, in Fig. 2.

Similar experiments were conducted upon an arch of stone of the same dimensions, and built with the same description of mortar as the example of brick just described. The stones were dressed only on the intrados, so as to obtain a firm bedding on the lagging boards of the centring and upon the heading joints, the other faces being left rough. It will be seen as we proceed that the stone arch manifested a far greater degree of solidity or resistance to deformation than that built of brick, for whereas, when the centres were struck, the greatest deflection in the former amounted to only $\frac{1}{16}$ th of an inch instead of $\frac{1}{4}$ in. as in the latter case. Similarly to the arch of brick, the stone in the other example showed only one weak point, placed about 22ft. from the abutment on the loaded half of the structure. The influence which the character of the masonry exercised upon the strength of the joints deserves mention, and the attention also of those engaged in the building of stonework and brickwork. As the test progressed it was noted that the mortar adhered far more firmly and tenaciously to the rough faces of the stones than it did to the dressed faces. It has long been known that roughly hammer-dressed stones, such as those used in rubble masonry, whether coursed or uncoursed, or even rude random work, made a better bond than the cut stones in ashlar work, although, for the sake of uniformity and appearance, the latter must be employed for large and important public edifices. One circumstance pro-

bably tended to this disintegration of the joints in the mortar. The stone employed was of a very hard description, and consequently endowed with but a very limited degree of porosity, and thus, probably, especially owing to the little time allowed, was not able to absorb or become intimately associated with the mortar. In a few cases a sudden shock quite spoiled the joint, although previously the stones appeared to be set as closely as possible.

So soon as the aggregate of the loads reached two tons per foot run, equal to about a quarter of a ton per square foot, the stone arch began to show signs of distress, and the accompanying deflections were 0.4in. and 0.3in. in the vertical and horizontal directions respectively. No new cracks were developed during a period of repose permitted the structure for three or four days; but, directly the loads were again increased, fresh fissures occurred on both faces of the arch, and extended throughout the whole breadth, as also happened with the brick specimen. These fissures, as was universally noticed, were accompanied by correspondingly-increased deformations which manifested themselves slowly, and, as it were, with gravity and dignity. While putting on a last charge of rails the arch gave way; the total breaking weight amounted to 74 tons, which is equal to 0.33 tons per square foot. With the exception of the cleft taking place near the springing of the unloaded half of the arch, all the others occurred parallel to the extrados, and were not in evidence until the point of failure had been very nearly determined. The difference to be remarked in the behaviour of the two arches under test is, that the one of brick suffered rupture from the action of compressive forces, and that of stone from those of an opposite nature. The experiments conducted with the arch of concrete next claim our attention.

UNIVERSITY COLLEGE, LONDON.

THE following prizes and certificates have been awarded in the courses of architectural lectures and architectural and constructional drawing and quantity surveying at University College, as the result of the work and examination of the Session 1896-1897:—

ARCHITECTURE.—Professor T. Roger Smith, F.R.I.B.A.

FINE ART.—Donaldson Medal: M. H. West, of Maidenhead. Prize, G. G. Lean, of Isleworth. Third Class, E. Martineau, of Hastings.

CONSTRUCTION.—Donaldson Medal: C. F. Dawson, of Barking. Prize, F. J. Freeman, of Blackheath. Second Class, H. S. R. Boyajian, of Kharput; G. G. Lean, of Isleworth. Third Class, E. Martineau, of Hastings; W. P. D. Stebbing, of London.

CLASSES MAINTAINED BY THE CARPENTERS' COMPANY: ARCHITECTURAL DRAWING.—1st Prize, J. Porter, of London; 2nd Prize, P. H. Pape, of London. Certificate, 3rd, E. Desch, of London.

CONSTRUCTION DRAWING.—1st Prize, A. E. Stump, of London; 2nd Prize, W. Smalley, of London. Second Class, A. S. Kilby, of London; A. Pethybridge, of London; A. Thwaite, of London.

QUANTITY SURVEYING.—ELEMENTARY CLASS: Prize, W. B. Payne, of London. ADVANCED CLASS: Prize, H. C. Simmons, of London. Second Class, T. A. Burr, of London; W. Smalley, of London. Third Class, H. B. Ward, of London.

HEALTH, RESORTS AND MEDICAL GEOGRAPHY.

A VERY instructive paper on Medical Geography is given in the *Lancet* of July 31, by Alfred Haviland, M.R.C.S. He shows by means of coloured maps that the high-mortality groups which "in every case skirt the lower courses of fully-formed rivers that seasonally flood their riparian districts, instances of which occur on the east and south coasts from the Tweed to the Devonshire rivers, between which extremes will stand out the blue colouring of high mortality along the rivers Tyne, Swale, Humber, Welland, Trent, Ouse, Yare, the East Anglian rivers, Thames, and the south coast rivers. The Thames basin has long been known as one of the great cancer fields of England and Wales." Mr. Haviland shows that cancer affects the river-valley systems, which, when sheltered, harbour the *matrices morbi* of rheumatism. In the Isle of Man the author found the water-logged valley between Douglas and Peel subject to the prevalence of cancer, whereas in the elevated localities, such as Manghold, Lonan, and Malew, characterised by a large area of limestone, there has been the lowest death-rates from malignant diseases. Mr. Haviland's remarks mainly refer to the disease distribution in the Isle of Man; but, of course, the

same conditions will be found to operate in England and all other places. This geographical distribution of phthisis and cancer, heart-disease and dropsy in females is a most important study as an aid to clinical medicine, and it has an interest also for all who are in the habit of seeking changes for health, and to the building community. The architect should know the facts, and we think Mr. Haviland's coloured maps will be of service. The author points out that in the centres of the mountain masses valley-room for the erection of cottages where protection would be afforded to the lung-tainted visitor, who would find the purest elevated climate and protection from wind. Instead of building hospitals for phthisical patients, cottages should be so constructed as to revolve on a turntable, and be adjusted to meet the varying sun and wind changes. The Isle of Man possesses extreme climatic conditions, owing to its physical configuration. For those who want a health change, a knowledge of where to go to avoid increasing the hereditary taint of disease is of the utmost importance from a medical point of view.

UTILISATION OF A "MOSS" ESTATE.

THE Cleansing Committee and the Parks Committee of the Manchester Corporation made a visit of inspection on Monday to the Carrington Moss estate. The Carrington Moss estate is, says the *Manchester Guardian*, about ten miles from Manchester, to the north-west of Sale. It was purchased by the Cleansing Committee in 1886, in order that the Corporation might be enabled to dispose of the refuse and other matter from the southern portion of the city. Of this, many thousands of tons are collected annually, and one of the great difficulties that then lay before the City Council was how to dispose of it to the greatest advantage to the community. When the estate was bought from the trustees of Earl Stamford, it consisted for the greatest part of wild, boggy moss land. There were 600 acres of wild moss, wholly unreclaimed, 209 acres of cultivated moss, 282 acres of cultivated land, and nine acres of roads, altogether 1,100 acres. The purchase cost of the estate to the city was £38,000. The committee in whose charge the land was placed at once began to use means to bring the whole of it under cultivation, utilising the refuse and nightsoil collected for a top-dressing to the moss. They laid out a sum of about £80,000 for light railways, of which some twelve miles have been laid, for roads, which have also been cut and metalled for a similar length, and for drainage, rolling stock for the railway, buildings, and other necessary works. The development of the estate has been so successfully carried out that an estimate prepared by the city surveyor, Mr. T. de Courcy Meade, places the value of the property at some £12,000 higher than its cost to the city. The whole moss, in fact, has been developed into highly cultivated farm and garden land. Refuse is conveyed daily in barges along the Ship Canal to a wharf which lies near the border of the reclaimed moss. From the barges the refuse is lifted into tanks, and taken to convenient points for redistribution over the ground. Of the whole estate the Cleansing Committee farm about 400 acres, a considerable portion of which is under tillage, and the remainder is laid down to grass. A homestead has been built for the farm bailiff, Mr. J. McConnell, and cottages have also been provided for the use of the workmen on the farm. The other land is let off for farming, and the tenants are supplied with manure by the committee. Since 1890 more than 425,000 tons of collected matter have been distributed over the various parts of the moss by the use of the light railways. Now that the whole of the property has been brought under cultivation it will be necessary to reduce the quantity of surface matter spread on the land, as the power of absorption by the soil has, necessarily, been diminished. In future, the occupiers of the land will be furnished with 20 tons of manurial matter per acre annually, and the surplus will be conveyed to the Chat Moss estate, which has been recently purchased. At the outset the bog land was thoroughly drained, and the percolation of water that is continually in progress is so great that, notwithstanding the constant additions of top dressing in soil, there is always a well-defined sinking of the land. The surface soil is shallow, but scarcely anything could be better adapted to the cultivation of root crops. The yield of roots this year will be particularly heavy.

Oats have also been grown in abundance. These are sold by the committee, at the ordinary market value, to the other committees for use in the Corporation stables, and so much of the hay as is not used for dairy purposes is, of course, dealt with similarly. A considerable profit has, for some years been made on the working of the farm. The land taken by farmers is used as dairy and vegetable farms, and many tons of produce are annually sent into the Smithfield market. Not far from the Corporation homestead the Cleansing Committee have placed about seventy acres of the reclaimed moss in the charge of the Parks Committee. This change was made a few years ago on the proposal of Mr. Needham, who suggested that shrubs and the smaller kinds of trees might there be grown for use in the parks and the city squares. Five acres were at first laid out, and it was then seen that much more land might with advantage be utilised. Additions to the plantation have, therefore, been made from year to year, and another plot of land will in a few weeks be added to this new Manchester arboretum. The golden elders that are placed during summer in the city squares are grown on what a few years ago was unreclaimed moss. There are acres of rhododendrons awaiting transplantation, besides poplars and other trees, which flourish in a peaty soil. Forest trees, whose roots strike deep, will not develop in the subsoil, but the birch and also the privet flourish well, and flowers grow in abundance.

THE DISTRICT COUNCILS (WATER SUPPLY FACILITIES) ACT.

A BILL known as the District Councils (Water Supply Facilities) Bill, which was drafted by Mr. J. A. Davenport, M.S.A., the engineer and surveyor of the Nantwich Rural Sanitary Authority, was promoted in Parliament last session by Col. Cotton Jodrell, Sir Jno. T. Brunner, Mr. Henry Tollemache, and other Cheshire members, who were successful in passing it through all its stages, and it now occupies a place on the Statute Book as 60 and 61 Vic., ch. 44. Mr. Davenport and the Nantwich authority have for years, says the *Chester Chronicle*, shown a high sense of their responsibilities to the ratepayers, especially in regard to the all-important matter of a water supply, and as a result of a meeting between Mr. Davenport and the agents of some of the larger estates in his district, a voluntary arrangement was effected under which tenants were to submit to a penny water rate, to pay a minimum of 10s. for each house supplied with water, while the owners were to make good the difference between income and expenditure for 30 years, when their contributions ceased, the amounts borrowed having in the mean time been cleared off. The arrangement worked splendidly, but under it the sanitary authority incurred certain risks. There was no power to compel a landowner to join in the agreement, and holders of settled estates found a difficulty in charging them for purposes of water supply. Nor was there responsibility, legal or otherwise, to compel their successors to recognise the agreement. Smaller properties are constantly changing hands, and their owners are naturally chary about accepting responsibilities that might affect the selling value of their lands and tenements. The Bill which has now become an Act was promoted to meet this difficulty. Col. Cotton Jodrell, Sir John Brunner, and Mr. Tollemache introduced the Bill, which after its second reading was made a Government measure, and the rest was plain sailing. To those gentlemen, and especially to Mr. Davenport—all of whom were accorded a special vote of thanks at last Saturday's meeting of the Nantwich Rural Council—the public in rural districts, from the cottager to the landowner, will feel grateful for their having been the means of passing into law an arrangement beneficent in its purposes and far-reaching in its scope. The following memorandum, issued by Government, will give an idea of the provisions of this useful measure:—

"The object of this Bill is to give facilities to district councils to make arrangements with landowners to charge their estates for the purpose of assisting in the provision of a supply of pure water thereto. At present limited owners and their powers come under the Reservoirs Act, 1877, by which they have power to carry out the supply by going to land improvement companies, spending their own money, or borrowing it, the sanction of the board having to be obtained thereto. This Bill provides that all owners,

limited or otherwise, may make arrangements with rural district councils, with the concurrence of the Board of Agriculture. The advantage of the Bill is that in rural parishes it often occurs that a long extension of water-main cannot be supplied without the assistance of the owner, as the rate for carrying out the work would be too heavy a burden for the (townships or) parishes concerned. The bill gives power to all owners to charge their estates, or provide the money for this purpose. Under this Bill, also, where a long extension of main is contemplated, all owners large or small, can combine to supply the need, whereas, under the Reservoirs Act, each individual owner can only act for his own estate. In the case of 'partial action'—that is, where only part of a parish or township had to be supplied—the non-receiver of the water would object to the special rate. The Bill does away with this difficulty. The cases where local sewerage works have been opposed by other ratepayers may be cited in support of the above. As an example of the effect of the Bill in a union where its principles have already been applied (by mutual arrangement, and by the zeal of the surveyor), about 120 miles of main have been constructed, supplying some 3,000 houses, which could not otherwise have been so treated, and applications for the water are still coming in from owners and occupiers all round. The bill is permissive."

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXIX.

BEFORE giving illustrations of the methods of joining the members of structures, a single article may be appropriated with advantage to the estimation of the strength of beams or girders, confining the remarks thereon to common sections having solid webs only. The proportioning of large braced girders, bridges, roofs, &c., is too extensive to be included in the scope of these articles.

The function of a beam or girder is to resist a bending moment acting upon it, which bending moment is composed of two factors, load and leverage. In a simple cantilever, such as a joist projecting from a wall and loaded at the end, the greatest bending moment will be $W \times L$; where W = weight applied at the end, and L = the projection or distance of weight from wall. If the load is distributed over the length of the cantilever, the formula becomes $\frac{W \times L}{2}$, because the centre of gravity of the weight is half-way along the cantilever. If a beam is supported at both ends and loaded in the centre, the greatest bending moment is $\frac{W \times L}{4}$, where L = the span or distance between supports. If the load be distributed, the formula becomes $\frac{W \times L}{8}$.

By fixing the ends of a girder its carrying capacity is increased; but, at the same time, the point of greatest bending moment is affected. In the case of the cantilever the greatest bending moment occurs at its junction with the wall or support; in the case of the beam simply supported at the ends, the greatest bending moment occurs at the centre. When a beam is properly fixed at both ends and loaded in the centre the formula is $\frac{W \times L}{8}$, but the greatest

bending moment occurs both in the centre and also at the ends. This affects the formation of the girder, inasmuch that in the simple supported case the bending moment dies away towards the supports, and so the section may be gradually lightened by either omitting flange plates, or by curving the girder so as to decrease its depth. But in the case of a beam having fixed ends and being loaded centrally, the same section must be maintained at the ends as in the centre; for a girder with a uniformly distributed load and ends fixed, the greatest bending moment is $\frac{W \times L}{12}$ and it occurs at the ends.

To these bending moments must always be added the bending moment due to the weight of the girder itself. This, of course, must be arrived at approximately; generally one is acquainted with former similar work which will form a good basis for other calculations. It is, therefore, useful to note sections and exact weights when obtainable; such notes frequently save time, and give one better and more certain information than a rapidly estimated weight.

There are two methods in general use for calculating the correct section of a girder; these methods are identical in principle, differing only in precision of result. The first method simply consists in dividing the bending moment by the effective depth of the girder. This gives at once the load upon the tension and compression flanges, from which it is easy to arrange a plate and angle section to suit. The effective depth of a girder is properly the distance between the

FIG. 183.

centres of gravity of the flanges, and is usually taken at the depth of the web-plate in plate girders having one or two flange-plates. Care must be taken when calculating the area of the tension flange to allow for the presence of rivet-holes; these may be ignored when considering the area of the compression flange, because the shanks of the rivets transmit the compressive stresses. At first sight this would appear to point to a difference of area in the two flanges. This difference, however, is lessened by the relative strength of wrought iron in tension and compression. The tensile strength of wrought iron is about 22 tons per square inch; its compressive strength is only 18 tons per square inch. When this is taken into account the difference in the flange areas will not be much. There are, however, practical reasons for using the same plate and angle sections in both flanges. As a broad principle, it is wise to aim at simplicity and uniformity in constructional work, because it involves less labour and less liability to error, while the additional weight sometimes entailed is seldom of any moment. An example of this method of calculation may be useful.

Given a case of a girder which has to sustain a bending moment of, say, 1,200 inch-tons, including that due to its own weight. The depth of a girder is generally about from 1/10th to 1/8th of the span, and is understood to mean the depth of the web-plate. We will assume a depth of 2 ft. in this case, the load upon the flanges will then be—

$$\frac{\text{bending moment}}{\text{depth of girder}} = \frac{1200}{24} = 50 \text{ tons.}$$

Note that the depth of the girder is figured in inches, because the bending moment is given in terms of inches—i.e., in inch-tons; if it were given in foot-tons, it would be necessary to put the depth of the girder in feet.

Putting the safe load on the material—wrought iron—at five tons per square inch in tension, we shall require an area of $\frac{50}{5} = 10$ sq.in. in the tension flange. This area must be provided by the angles and flange-plate, minus the two rivets connecting them together. It is usual to ignore the web-plates when calculating the strength of a girder by this method. Obviously this flange area may be made up in many different proportions of plates and angles: we may use a narrow and thick flange with a single web-plate, or a wide and thin flange and two webs, thus forming a box girder. The length of the girder and the duty it has to perform govern to some extent its width; if it is a long girder and subject to live loads or vibrations, it will be wise to adopt a box section with wide flanges, say of half the depth of the girder. Using (Fig. 183) two angles, each 3 in. by 3 in. by 1/2 in., and a flange plate 12 in. by 1/2 in., we get an area of: Two angles, 3 in. by 3 in. by 1/2 in., minus one 1/2 in. rivet-hole each = 4.75 sq.in.; one plate 12 in. by 1/2 in., minus two 1/2 in. rivet-holes

= 5.25 sq.in.; total flange area = 10.00 sq.in., which will meet the case for the tension flange. Trying these sections over for the compression flange, and ignoring the presence of rivet-holes, we get: Two angles 3 in. by 3 in. by 1/2 in. = 5.5 sq.in.; one plate 12 in. by 1/2 in. = 6.0 sq.in.; total area = 11.5 sq.in. Dividing this area into the load upon the flange, we get a stress of 50 tons = 4.35 tons per square inch, which will not be too high in relation to the tension stress of 5 tons per square inch.

In these figures no account has been taken of the web plates, but they should have sufficient area to resist safely the maximum shearing action on the girder. The ultimate shearing strength of wrought iron may be put at 18 tons per square inch, the same as the compressive strength; generally, however, it will be found that girder webs have to be made in excess of the calculated thickness for practical reasons, such as allowance for corrosion and resistance to buckling.

Passing now to the second method of estimating the strength of a girder section:—In the first method the flange area was massed together, and multiplied by one leverage. In this second method every fibre, both of flange and web, acting at its respective distance from the centre of gravity of the section, is taken into account. This involves the calculation of the moment of inertia of the section which, as stated in Article XIX., is an easy matter when dealing with simple sections, but becomes more difficult as sections become complicated. Reprinting for convenience the rule given in Article XIX., we will work out the moment of inertia of a girder section and estimate its strength therefrom. To find the moment of inertia of any cross-section made up of a number of simple figures. Rule:—Find the moment of inertia of each of the simple figures about an axis traversing its centre of gravity parallel to the neutral axis of the complete figure, then multiply the area of each of the simple figures by the square of the distance between its centre of gravity and the neutral axis of the whole figure. Add all the results together for the moment of inertia of the whole figure.

Taking the girder section given for the illustration of the first method of calculation, Fig. 183, the first thing to do is to arrange its elements in a minimum number of simple figures parallel to the neutral axis of the complete section, as in Fig. 184.

It will be noticed that two assumptions have been made—the one that the neutral axis passes through the centre of gravity of the section; the

FIG. 184.

other that the rivet-holes are omitted in the compression flange as well as the tension flange. The first assumption, if not strictly correct, is sufficiently near for all practical purposes when dealing with wrought iron or steel. The second is adopted simply for convenience, and is also accurate enough for all ordinary work. By effecting these slight alterations we are able to halve the calculations necessary for finding the moment of inertia. If I is reckoned out for one-half of the section, the operation of multiplying by 2 gives I for the whole section. Taking one-half, then, and putting the necessary letters and figures to it, the dimensions and relations illustrated in Fig. 185 are obtained. By the rule previously stated, we require first the moment of inertia of each of these sections about an axis

traversing its centre of gravity parallel to the neutral axis of the whole section. Then—

$$\begin{aligned} I \text{ for A} &= \frac{10.5 \text{ in.} \times .5^3 \text{ in.}}{12} = .11 \\ I \text{ for B} &= \frac{5.25 \text{ in.} \times .5^3 \text{ in.}}{12} = .05 \\ I \text{ for C} &= \frac{1.75 \text{ in.} \times 2.5^3 \text{ in.}}{12} = 2.28 \\ I \text{ for D} &= \frac{.75 \text{ in.} \times 9^3 \text{ in.}}{12} = 45.56 \end{aligned}$$

Then multiply the area of each of the simple figures by the square of the distance between its

FIG. 185.

centre of gravity and the neutral axis of the whole figure thus—

$$\begin{aligned} \text{Area of A} \times \text{distance}^2 &= 10.5 \text{ in.} \times .5 \text{ in.} \times 12.25 \text{ in.} = 787.50 \\ \text{Area of B} \times \text{distance}^2 &= 5.25 \text{ in.} \times .5 \text{ in.} \times 11.75 \text{ in.} = 362.22 \\ \text{Area of C} \times \text{distance}^2 &= 1.75 \text{ in.} \times 2.5 \text{ in.} \times 10.25 \text{ in.} = 459.37 \\ \text{Area of D} \times \text{distance}^2 &= .75 \text{ in.} \times 9 \text{ in.} \times 4.5 \text{ in.} = 136.69 \end{aligned}$$

Adding the results for the moment of inertia of the whole figures, we obtain—

$$\begin{aligned} I \text{ for A} &= .11 \\ I \text{ for B} &= .05 \\ I \text{ for C} &= 2.28 \\ I \text{ for D} &= 45.56 \\ \text{Area} \times d^2 \text{ A} &= 787.50 \\ \text{Area} \times d^2 \text{ B} &= 362.22 \\ \text{Area} \times d^2 \text{ C} &= 459.37 \\ \text{Area} \times d^2 \text{ D} &= 136.69 \end{aligned}$$

$$\text{Total I} = 1793.78 \times 2 \text{ halves} = 3587.56.$$

To use this value for estimating the strength of the section, it is necessary to divide it by the distance of the extreme edge of the section from the neutral axis. By so doing a new value is obtained, which is termed the modulus of the section, which is usually represented by the letter Z. This modulus, divided into the bending moment, gives the stress on the material at the extreme edge of the section. The modulus in the present case is $\frac{3587}{12.5} = 287$. Dividing this

value into the bending moment, we have $\frac{1200}{287} = 4.18$ tons per square inch on the outside fibres of the flange-plates. The difference between this stress of 4.18 tons and the stress of 5 tons per square inch, which was calculated by the first method, is due to the fact that the second method takes the web-plates into account, and as they are taken rather heavy in this case, the difference in stress is more apparent. This second method is, of course, more accurate than the first; but it involves more calculation, which means loss of time, while increasing the liability to error when estimates have to be worked out quickly. Calculating the moment of inertia for any section whatever can generally be accomplished by this method, and the example is given as supplementary to Article XIX., on Columns, as well as for the requirements of the present article.

J. H.

A MAMMOTH CATALOGUE.

MESSRS. YOUNG AND MARTEN, of the Caledonian Works, Stratford, are preparing a complete general catalogue for issue presently, which rivals the Directory in size, and probably equals it in usefulness, while the style in which it is being produced entitles it to rank as a *volume de luxe*. It consists of ten volumes, each containing about 450 pages. The paper is of sumptuous quality, and the illustrations unexceptionable.

A more complete compendium of the various requirements of the building trades it would be

impossible to desire. It comprises every class of plumbers' goods, sanitary appliances, builders' ironmongery, metals, oils, colours, artists' materials, joinery and timber, glass of all kinds, lime, cement, slates, tiles, bricks and pottery, felts, laths—indeed, so far as we have tested the comprehensive indexes, there is not an article needed in the smallest shop, or the colossal works of the great contractor, that cannot be selected and priced by its aid.

Customers of the firm know, without our assurance, that this convenient comprehensive-ness has always been seconded by high quality, and with the aid supplied by such a catalogue as this, and the immense resources of a firm like Messrs. Young and Marten at his disposal, a builder need never be at a moment's loss.

CHIPS.

The urban district council of Holyhead have obtained the assent of the ratepayers to a proposal to purchase the undertaking of the local waterworks company.

The Sudbury Schools for the Harrow United District School Board are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The urban district council of Kettering have unanimously decided to promote a Bill next session for the purchase from a company of the local waterworks undertaking.

Under the direction of H.M. Board of Works, the life-sized bronze statue of King James II., disguised as a Roman soldier, now in the gardens at the rear of Whitehall-place is now being moved a few yards, into a position where the public will have the opportunity of seeing it more easily. It is being re-erected in the garden of Gwydyr House, and, instead of looking towards the river, his Majesty will face westward, looking on Whitehall and the Treasury buildings.

An examination of master and operative plumbers applying for registration under the National Registration of Plumbers was held on Saturday by the Worshipful Company of Plumbers at the Borough Polytechnic Institute. Five succeeded in passing the examination in practical workmanship.

The memorial stones of new Wesleyan schools at Lowerhouse, Burnley, were laid on Saturday. The schools are being erected at a cost of £2,500, and will provide accommodation for between 500 and 600.

The foundation-stone of new offices and board-rooms for Bucklow Union was laid at Knutsford on Friday. The erection of the buildings, which are estimated to cost £4,500, forms part of an extensive scheme, contemplated for some years, of rearranging the workhouse. Friday's proceedings included the relaying of the original foundation-stone of the workhouse hospital, laid by Lady de Tabley in 1881, and displaced by the extension of the administrative block.

The Port Talbot Railway, which is 17 miles in length, and is expected to be an important adjunct to the Port Talbot docks, now in course of construction, was opened on Tuesday. The cost of the line has been £120,000. The Port Talbot docks are to be completed in the autumn of next year.

On Saturday afternoon Sir Humphrey de Trafford laid the foundation-stone of the new Roman Catholic church for Eccles. The site fronts Liverpool-road, and is adjacent to the present mission schools. The cost of the church and presbytery—the latter of which is being built on a portion of the site of the old Eccles racecourse—will be about £8,000.

The magistrates of Manchester have granted provisionally a full license in connection with the hotel which the Midland Railway Company proposes to erect near the Central Station. The hotel will be bounded by Peter-street, Lower Mosley-street, Windmill-street, and Mount-street. The hotel will be built under the provisions of a clause in the Act obtained by the Midland Company last session. It will contain 300 bedrooms, and a large concert-hall will be one of the special features of the building.

Pluscarden Priory, near Elgin, has just been purchased by the Marquis of Bute from the Duke of Fife. It is expected that the marquis will have the priory restored, and that the work will shortly be proceeded with.

New buildings are being added to the sanatorium at Brighton, for the town council. They comprise a new administrative building, one scarlet-fever block, a block containing six small wards for patients requiring special isolation and for paying patients, a porter's lodge, and a discharge building. The contractors are Messrs. Peters and Son, whose tender was accepted nearly a year since at £19,775.

OBITUARY.

MR. DANIEL BIRKETT, F.R.I.B.A., of 45, Lowther-street, Carlisle, who died recently at Roehampton at the age of sixty, was a son of the late John Birkett, of Broomhills, near Carlisle, and was articled to the late John Dobson, of Newcastle, the architect of Holme Eden, near Carlisle, Beaufront, near Hexham, the Central Station at Newcastle, and other notable works. Mr. Birkett was the architect of the Cumberland Union Bank, Carlisle; he won the premium given by the corporation of that city for the best design for private residences on the Aglionby lands; and from his designs were erected the buildings on the east side of Portland-square, Carlisle, and the business premises of Messrs. Hope and Bendle in the same city. He was the architect of many schools erected in the neighbourhood of Carlisle, and those of Denton Holme and Kendal-street in that city. He joined the Royal Institute of British Architects as an Associate in 1864, becoming a Fellow six years later. Some ten years ago he retired from the active pursuit of his profession, and resided for the most part at Silloth.

MR. GEORGE TAIT, retired builder, of Hawick, N.B., died at his residence, 76, High-street, in that borough, on Tuesday week, aged four score years and four. Deceased's father was originally a mason, and afterwards a master builder, and in 1836 took his two sons—George and John—into partnership with him, and under the designation of George Tait and Sons the business was continued till the year 1856, when the old man died. John (since deceased) having about 1853 emigrated to Australia, the business was continued for upwards of 30 years by Mr. George Tait. Having a thorough knowledge of the town, deceased was for years much engaged with the arbitration of old marches in the cases of houses and garden dykes, while as a valuator his services were also much in requisition. During their long business career, father and son erected a very large number of the buildings of the town and neighbourhood, including many mills and large residences, East Bank U.P., Wilton Parish, Orrock U.P., and St. Andrew's Free churches. At one time Mr. Tait took a considerable interest in public affairs, and was more than once returned to the old town council. He was also a useful member of the parochial board. Some years ago Mr. Tait retired from business, and was succeeded by Mr. Adam Scott. Mr. Tait, who was a widower for 46 years, is survived by a daughter.

It is proposed to restore the parish church of Dean Prior, near Buckfastleigh, South Devon, the parish of which Robert Herrick, the poet of the "Hesperides," "Cherry Ripe," "Gather ye Roses," and other familiar verses, was vicar. The sum of £1,000 is required for restoring and reseating the Perpendicular church, whose characteristically Devonian tower is covered, quite needlessly, with grey plaster. It is intended to remove this, and to make the stone work visible once more.

At a special meeting of the Warminster Town Council, held on Monday, the report of the sewage disposal committee on the plans and estimate for the scheme of sewerage and sewage disposal was adopted, and the clerk was instructed to apply to the Local Government Board for sanction to a loan of £5,000 for carrying out the work. The scheme is to dispose of the sewage by means of the septic tank system at Smallbrook, and to run the effluent off the present sewage farm; to complete the drainage of the Common, and to dispose on the land the sewage of this part of the town.

Steady progress is being made by Mr. Thompson's staff of workmen with the work of restoring the west front of Peterborough Cathedral, attention now being given to the north-west tower. During the last week about 8ft. of the south-east pinnacle was replaced with new Clipstone stone. The north gable of the west front is now nearly out of the contractors' hands, the pointing having been finished, and it awaits re-enthronement of the various figures within their niches. The small columns of Alwalton marble, which had perished, have been replaced in the same material, a bed of it having been successfully struck on Mr. Fitzwilliam's land at Alwalton.

The well-known Elephant and Castle tavern at the junction of Walworth and Kennington Park roads, Newington Causeway, and facing four other main thoroughfares, is about to be rebuilt, several adjacent properties being taken in. The building will be increased in height, and crowned with a domical roof, and more bar and billiard-room accommodation will be provided. Mr. John Farrer is the architect.

COMPETITIONS.

HUDDESFIELD: CASTLE HILL TOWER.—One of the schemes originated at Huddersfield for the celebration of the Diamond Jubilee was the erection of a tower on Castle Hill, and so well has the idea met with public approval that about £1,530 has been already subscribed for its accomplishment. Recently designs were invited, and of these 32 sets were forthcoming from various parts of the country. The designs were duly placed on public exhibition, and a committee of the subscribers was appointed to adjudicate upon the plans, for which one premium of £20 was offered. The work of selection was concluded on Tuesday. In the first instance six sets of designs were selected from the mass, and these were eventually reduced to three, which had the following positions in the competition allotted to them:—1. Mr. Isaac Jones, 6, Deerbrooke-road, Herne Hill, S.E.; 2. Messrs. John and A. C. Haigh, York-place, Huddersfield; and 3. Mr. Walter R. Watson, 689, Great Western-road, Hill Head, Glasgow. The next step to be taken will be to forward the selected design to Sir J. W. Ramsden, Bart., the lord of the manor, who has given the site for the tower, and then to ask Mr. Jones to send in the specifications, upon which tenders for the completion of the work may be invited. Mr. Jones's design provides for a high, square, feudal tower, with a projecting window at the base, giving light to the caretaker's house and the various offices connected therewith. The architect had evidently studied the requirements of the scheme on the spot, and had sent in a sketch of the tower as erected on the site likely to be chosen. Messrs. Haigh, the second competitors, had also fixed upon for their design a massive square tower, having a circular turret from base to summit at each angle of the square. The competitor placed third, who had signed his design "Clutha," had produced a sketch showing a square tower surmounted by a lantern. Given suitable weather, it is expected that no great lapse of time will ensue before the Castle Hill, which forms such a striking figure in the landscape, will be rendered further notable by the erection of the Jubilee tower.

NEW YORK.—The second competition for the New York Public Library is to be confined to twelve architects, or firms of architects, six of whom, Messrs. J. H. Freedlander; Haydel and Shepard; Hornbostel, Wood, and Palmer; Howard and Cauldwell; W. Wheeler Smith, with Walker and Morris; and Whitney Warren, have been selected from among the twelve who received awards in the preliminary competition; while six others, Messrs. Carrère and Hastings; Cyrus L. W. Eldritch; Charles C. Haight; McKim, Mead, and White; Peabody and Stearns; and George B. Post, have been added to them by invitation. Three of the members of the jury of seven which is to consider the designs submitted in the second competition are to be practising architects, chosen by the competitors themselves. Three others are to be chosen by the Trustees of the Library out of their own number; and the seventh member is to be the Director of the Library. The jury of seven is to choose, by majority vote, three designs, sending them, with indications as to their order of merit, to the Trustees, who are to select one of them, and send it to the city authorities, with the recommendation that its author be appointed architect of the building.

"OWEN JONES" PRIZE.—This competition was instituted in 1878 by the council of the Society of Arts, as trustees of the sum of £400 presented to them by the Owen Jones Memorial Committee, being the balance of subscriptions to that fund, upon condition of their expending the interest thereof in prizes to "Students of the School of Art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damasks, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design" and a bronze medal. The following is a list of the successful candidates:—William F. Blagg, School of Art, Chelsea, design for a wallpaper; Helena R. Dow, School of Art, Glasgow, design for a wallpaper and frieze; Robert Paterson, School of Art, Glasgow, design for a carpet; Herbert D. Richter, School of Art, Bath, design for wallpaper; Bertha Smith, School of

Art, Bloomsbury, design for wallpaper and frieze; John Wadsworth, School of Art, Macclesfield, design for carpet. The next award will be made in 1898, when six prizes will be offered for competition.

CHIPS.

The Earl of Carlisle opened on Saturday at Carlisle the first exhibition in connection with the newly-formed Cumberland and Westmoreland Society of Arts and Crafts, and gave an address upon the work of such associations.

The Duke of Devonshire laid on Monday, with masonic ritual, the corner-stone of the new Victoria Nurses' Home in connection with the Bradford Royal Infirmary. The building, which was illustrated by us by plan and perspective on the 20th ult., is being erected from designs by Messrs. Milnes and France, of Bradford, at a cost of £10,000.

The members of the East Riding Antiquarian Society paid a visit on Friday to Rillington, Thorpe Bassett, and Winttingham, three East Riding villages at the foot of the Wolds, near Malton, for the purpose of inspecting the churches there.

An Austrian Scientific Expedition, consisting of the Vienna Professors Bendorf and Niemann, and Military Captain Schindler, left Vienna on Monday morning to continue excavations at Ephesus.

The Earl of Derby will attend the formal opening on Thursday week, the 16th inst., by the Countess of Derby of the Victoria Jubilee Technical School at Preston.

The indefatigable vicar of Croyland writes stating that he has nearly finished the new east end of the abbey church, and on Sunday last administered therein the Holy Communion at 8 a.m. for the first time. The three sections of the building still needing immediate repair are the underpinning of the north wall, and rebuilding a buttress, the porch, and the roof, for which a further sum of £800 is still required. He is also endeavouring to raise £400 for an organ.

On Wednesday in last week Col. A. G. Durnford, R.E., one of the inspectors of the Local Government Board, held a public inquiry at the Council Chamber, Tonbridge, relative to an application made by the urban district council for permission to raise a loan of £9,600 for the purchase of Tonbridge Castle and grounds.

A light railway from Chichester to Selsey was opened on Friday by the Mayoress of Chichester. The new line, which is seven and a half miles long, extends from the south side of Chichester Station to the Manor House, Selsey, about 200 yards from the church. It has been laid at a small cost, the paid-up capital of the company being only £12,000, with an issue of £7,000 in debentures. It is hoped that the result will be to develop Selsey as a watering-place.

The sales at the Mart, Tokenhouse-yard, last week were small and disappointing, the aggregate realisation, as registered at the Estate Exchange, being £15,600, as against £21,133 recorded for the corresponding week of last year.

At Walton-on-the-Naze on Tuesday, the first pile of the pier extension works, the completion of which will enable the London steamboats to call there, was driven by Mrs. Round, wife of Mr. James Round, M.P. It is proposed to extend the pier from its present length of 600ft. to 2,500ft., to construct along it an electric tramway, and to build a pavilion at the sea extremity. It is intended to complete the work in time for next summer's boat service.

Colonel A. J. Hepper, D.S.O., R.E., has held an inquiry at Swadlincote with regard to the proposal of the urban district council to borrow £5,000 for works in connection with the sewerage and sewage disposal scheme.

At Sherrard-road, Manor Park, on Tuesday afternoon, a timber stack belonging to Mr. Birch, a local builder, was fired by lightning and destroyed.

On Saturday afternoon the foundation-stones were laid of new Sunday-schools in connection with the Primitive Methodist church in Westfield-street, St. Helen's. The new schools occupy the site of the old chapel in Kirkland-street. The schools, which will accommodate between 600 and 700 scholars, are being built by Mr. Jos. Ellison, Mr. Wilson, Runcorn, being the architect.

A message was received at Bangor on Monday, announcing the arrest, at Antwerp, of Robert Hughes, of Bangor, the secretary of the Bangor and Arfon Permanent Mutual Building Society, and of Lloyd's Association, and a member of the Carnarvonshire County Council and the Bangor City Council. He left the town some time ago, and it was afterwards ascertained that there were defalcations in connection with the society's funds amounting to £1,886. A warrant was then issued for his arrest. A month is expected to elapse before he is brought to Bangor, owing to extradition difficulties.

Building Intelligence.

BIRMINGHAM.—By permission of the governors, architect (Mr. W. Henman, F.R.I.B.A.), and builders (Messrs. Barnsley and Sons), a numerous party of members and friends of the Clerks of Works and Builders' Foremen Association paid a visit to the New General Hospital on Saturday afternoon. The party was conducted over the building by Mr. Parsons (the clerk of works) and Mr. Randall (the foreman). In their progress through the building they met Mr. J. C. Holder, whom they welcomed with great cordiality. Mr. Holder thanked them for their expressions of goodwill, and said that what he and his colleagues had done on behalf of the city had been a labour of love. He described the aims of the administration in the planning of the building, and expressed the opinion that on its completion Birmingham would possess the best-equipped and the finest hospital in the kingdom. At a subsequent period, while the party were in the chapel, the president (Mr. Patchett) expressed the hope that at least one of the windows would be reserved for a stained-glass memorial to Mr. Holder. The suggestion met with the approval of the company, and over £10 was subscribed towards a fund for that purpose by the visitors.

CHICHESTER.—Attention is being directed to the condition of this cathedral, and the urgent necessity for extensive restoration. An appeal is being made by the Duke of Richmond and Gordon, the Bishop of Chichester (Dr. Ernest Wilberforce), and the Dean (Dr. Randall). The executive committee for the restoration of the cathedral propose, in the first place, to set on foot the rebuilding of the north-west tower, which has been pronounced to be necessary for the safety and preservation of the fabric originally supported by the tower before it fell. Mr. J. L. Pearson, R.A., who has been appointed architect to execute this part of the work, has already prepared plans, and a builder is prepared to carry out the work for £6,250. It is proposed to build so much of the tower as can be completed with the funds already subscribed, and to carry on the work to completion as subscriptions come in. The committee hope to be able to undertake, as funds are supplied, the repair of the south transept, the renewing and repairing the dilapidated pavement of the nave and aisles, the re-erection of the nine pinnacles on the buttresses, and the restoration of the ancient library for the chapel of St. John.

CHELtenham.—The scheme initiated by the corporation to erect a kursal and municipal offices, at a cost of £48,000, on the site of the existing winter-garden building, has met with an unexpected check. The application for a loan has been refused by the Local Government Board, whose inspectors recently held an inquiry into the matter. The grounds of objection are that the Local Government Board consider that some of the details of the scheme are open to objection, and that the estimates are likely to be exceeded; while at the same time they question whether the site is the most suitable for municipal offices, and whether offices could not be provided at less cost on another site. They also raise an objection to the demolition of the existing buildings, and recommend the council to give consideration to those points in any further scheme they may have before them.

EDINBURGH.—At the Castle several unobtrusive old buildings erected a century ago are being removed to make room for a military hospital. The new building will have architectural features of a Scottish character, which the old buildings did not possess. The ground plan covers an area of 160ft. by 120ft. The block, which will face Princes-street, will be three stories in height, and towards Castle-terrace there will be an annexe of the same height, the wall of a promenade, and the gable of the south block, which will only be of two stories. On the east side will be the kitchen and entrance gateway. The whole of the buildings will be of stone. To Princes-street a prominent architectural feature of the building is a range of dormer windows deeply set in the wall-head, and rising considerably over it. The wall-head between shows a corbelled cornice with embrasures, and round the dormers is carried an ornamental stringcourse. The windows of the lower stories are square-headed, with jambs of dressed stones. Between the building and its annexe, which faces Castle-terrace, the façade is broken by a large recess.

The gable of the south block has bold crowsteps, and the windows show varied features. On the ground floor of the Princes-street block will be a ward with fourteen beds. There will be a lobby with entrance from a courtyard, round which the buildings will be grouped. This will lead to a waiting-room, which in turn will communicate with the surgery. The other accommodation at this level is set apart as pack and linen stores. A stone staircase, which is shown in the elevation as a projection, will give access to the floors above. On the first floor there will be a sixteen-bed ward, a day-room, and three small wards, with the usual rooms for orderlies. The floor above in its internal arrangements corresponds to a large extent with that just described. There will be a sixteen-bed ward, and one of three other small wards will be set apart for officers. In it there will be two beds. From this block a corridor runs southwards, at the end of which a new kitchen establishment for the hospital is to be constructed. The kitchen will only be one story in height, and will be lighted from the top as well as the sides. In the south block, on the ground floor, is a ward of five beds for special infectious cases, with separate entrance and sanitary arrangements, so as to isolate it from the rest of the building. There will be rooms for the orderlies and stores on the ground level, and in the floor above will be the quarters for the warrant officer, who has charge of the discipline of the establishment under the medical officer, the orderlies, and the steward. The beds in the wards are placed two between each window, so that there will be abundance of light for the patients. The wards will be heated by hot-water pipes and by special stoves, and the vitiated air will be extracted by means of flues. Between the two blocks on the west side a raised promenade will be constructed overlooking Castle-terrace, on which the patients may take the air. It is approached from the courtyard by a double flight of steps, and between the pillars carrying it there will be seats placed for the patients. The hospital buildings on the Castle side are inclosed by a wall, and for entrance the old Queen Anne pillars will be used. They are to be taken down, and put up in another position from what they now occupy. The courtyard has been formed by removing the old magazine building, which was 74ft. by 41ft., and part of the space thus secured will be laid out as an ornamental ground. The cost of the hospital will be about £18,000. The plans were designed in the War Office, and have been adapted locally by District-surveyor T. Ivor Moore, R.E. The specifications were prepared locally under Colonel W. H. Patten, commanding the Royal Engineers in Scotland, and the district surveyor. The contractor has a year to complete the buildings.

FELIXSTOWE.—A new hotel, to be known as the Balmoral, is about to be built on the brow of the cliffs at Felixstowe. The plans, prepared by Mr. T. W. Cotman, M.S.A., of Ipswich, show an entrance hall 47ft. by 25ft., dining-room 54ft. by 28ft., with a bay window 18ft. by 12ft.; and an extra dining-room 28ft. by 17ft. 6in.; smoking-room 28ft. by 24ft., with a bay corresponding to that of the dining-room; billiard-room 45ft. by 28ft. (two tables); drawing-room 30ft. by 24ft.; sitting-rooms, each 28ft. by 15ft.; and there will be 120 bedrooms all told. In the centre of the building will be a winter garden 55ft. by 30ft. Verandahs and balconies will run along the front.

FENTON, STAFFS.—The formal opening of the new schools erected by the Stoke-on-Trent United District School Board in Queen-street, Fenton, took place on Monday week. The school block stands upon a site 6,000sq. yds. in extent, and is planned on the central-hall system. The entrances are so arranged as to obviate as much as possible the objection to the system—viz., cross currents from entrances in central hall. The internal walls are plastered in the upper portion and have tile dadoes on the lower portion in very light tints. The exterior is of red brick with stone dressings, and tile roofs, with a tower over one entrance for water-supply tanks and bell. The ventilation is on Boyle's system. Accommodation is provided for 600, half boys and half girls. The central hall is 8ft. by 38ft. There are six classrooms, each 25ft. square, two classrooms 25ft. by 22ft., and two classrooms 34½ft. by 22ft.; two teachers' and two book and store rooms, four cloak-rooms and entrances. The flooring is of pitch-pine blocks, and the heating is by low-pressure steam. The furniture is principally in oak. The lighting is by gas on the Stott-Thorpe system. The contractor for the

general work is Mr. John Bagnall, of Fenton; block flooring by the Wood Block Flooring Company, of Victoria-street, London; tile dadoes by Messrs. Minton, Hollins, and Co., of Stoke-on-Trent; painting by Mr. E. Peake, Fenton; ventilation, Messrs. Boyle; heating by Messrs. R. Dawson and Co. (Limited), of Stalybridge, near Manchester; and the furnishing by the Bennett Company, of Glasgow. The work has been carried out from the plans and under the supervision of the board's architects, Messrs. R. Scrivener and Sons, of Hanley.

IPSWICH.—The old workhouse buildings at Stoke being so ill-arranged, cramped, and insanitary as not to be worth rebuilding, a new workhouse is in course of erection at the other side of Ipswich on a site facing Rashmere Heath and the Woodbridge-road, at a cost of £28,000. The buildings consist of a series of semi-detached blocks, including an administrative block in the centre, comprising dining-hall (with open-timber roof), kitchen, sculleries, board-room, master's residence, laundry, and stores. Connected with this block by a corridor is the infirmary, and in an isolated block near the main turnpike road are the vagrant wards. Near by are the main buildings, comprising day-rooms and dormitories, and other detached blocks are arranged as workshops, boiler-house and mortuary. The building materials are local red bricks for external walls, the inside walls being of Peterborough bricks, and the roofs are covered with Bangor slates. The flooring of corridors and sanitary annexes is of terrazzo, that of the general building of granolithic stone in some portions and ordinary deal in others. The joint architects are Messrs. Salter and Adams, of London, and Mr. W. L. Newcombe, of Newcastle-on-Tyne, and the contractors are Messrs. Grimwood and Sons, of Ipswich.

LEEDS.—The foundation-stones of a new Hebrew place of worship, to be called the Central Synagogue, in Templar-street, Leeds, were laid on Sunday. The site is on the south side of Templar-street, and, when completed, the building will have a frontage of 80ft. to that street. The premises will include a synagogue 60ft. long by 48ft. wide, with galleries on three sides, providing accommodation for 800 people, robing-rooms, vestry, a schoolroom with accommodation for about 250 people, and other necessary accommodation. The building will be of brick with stone facings, and will have two entrances from Templar-street. The architect is Mr. Alfred Bentley, of Leeds; and the builder is Mr. Fred. Puffitt, of Hunslet.

MADDERTY, N.B.—The ancient barn-like parish church was reopened on Monday after transformation, both externally and internally. A new entrance upon the north side, with porch facing west, has taken the place of two openings now built up, and the old square-sashed windows have been superseded by stone mullioned and arched openings of two and three lights; while new windows have been pierced in the north and east walls, and a little rose window has been introduced in the west gable. The gallery has been taken away, and the church enlarged by utilising the space formerly occupied by the old lobby and staircases. The pulpit, with new carved panels, is placed in the north-east corner on a raised and tiled platform, on which also the choir is to be accommodated. Three stained-glass windows have been put in, while all the other windows have been filled in with cathedral tinted glass. One new three-light window represents the Crucifixion, St. Mary, and St. John the Evangelist, and having at the right and left lower corners respectively the obverse and reverse of the ancient Inchaffray seal. The glasswork of the windows has been executed by Messrs. Ballantyne and Gardiner, Edinburgh.

MOTHERWELL.—The plans of a new model lodging-house, to be erected by the Lanarkshire Model Lodging-House Company in Orbiston-street and Meadow-road, Motherwell, were lodged in the Dean of Guild Court of that borough on Tuesday. The design is Free Classic, with a frontage showing two circular turrets at the angles, and an arched decorated doorway in the centre. Accommodation is provided for 316 lodgers, with four special rooms for warders, and a manager's house, from which there is a private entrance to the different parts of the building. The dining-room is 55ft. by 34ft.; recreation-room, 65ft. by 34ft.; and the kitchen, 35ft. by 20ft. The estimated cost is £6,500. The building, which is to be erected from plans by Mr.

Alexander Cullen, architect, Hamilton and Motherwell, is to be called the Victoria Home.

NEW YORK.—Following the example set in London by Lord Rowton, Mr. D. O. Mills, of New York, proposes to provide in that city decent and comfortable hotel accommodation at a price within the means of people who have heretofore been obliged to find shelter at lodging-houses; and the first of the hotels built for this purpose is, says the *American Architect*, now nearing completion. The structure, of which Mr. Ernest Flagg is the architect, is situated on Bleeker-street, extending from Thompson-street to Sullivan-street, a distance of 200ft. The three fronts are faced with Indiana limestone and white brick, and are ten stories high. The plan, in brief, consists of two square blocks, each with a large courtyard in the centre, room being left between the blocks for a connecting-hall, with stairway and elevators on each side. The stairways have outside windows, giving a current of fresh air across the hall. In each of the main blocks is a corridor passing entirely around it, with bedrooms on each side, some opening on the courtyard, and the others on the outside, but all having ample light; and the re-entering angles are occupied by ventilation shafts. The bedrooms are only 5ft. wide and 7ft. long, and it is expected that at 20 cents a night, which is the ordinary charge for a lodging-house bunk, the building will pay a reasonable interest on its cost. A restaurant, capable of accommodating 400 people, occupies a portion of the ground floor. Ventilation is provided by means of fans, which exhaust the air from the corridors; and as the partitions between the cubicles do not, except in certain instances, extend quite to the ceiling, a good current is kept up through them. To facilitate ventilation, also, the windows opening on the courtyard are fitted with wire screens in place of glass. As the courts have glass roofs, and the air in them is warmed by steam-coils, it is thought that no injurious draughts will follow from this arrangement. A second hotel, similarly arranged, is in process of erection near by.

RYTON-ON-TYNE.—On Saturday afternoon, Mrs. Simpson, wife of Mr. John Bell Simpson, managing partner of the Stella Coal Company, laid the foundation-stone of a block of buildings to be known as "The Robert Simpson Memorial Homes for Aged Miners." The premises will comprise 10 homes for the company's aged miners. The Stella company have given the site of 800 square yards, and the contract price is £1,220. The estimated cost of the buildings, including the value of site, is £1,350. The site abuts on the main turnpike from Newcastle to Hexham, and is situated at Barmoor, about a mile west of the village of Ryton. The homes, which will have a south aspect, consist of eight one-story homes and two two-story homes, one of each of the latter being placed at the two ends of the block. Each of the eight homes will consist of two rooms; the two end homes will have three rooms each. There will be a pantry, a small scullery, and conveniences at the back of each cottage. The measurement of the kitchens of the one-story cottages is 13ft. by 13ft., and that of the bedrooms 13ft. by 10ft. The rooms are placed one on each side of the door. The two end cottages will have a kitchen 14ft. by 17ft. and two bedrooms upstairs of 11ft by 8ft. and 14ft. by 10ft. respectively. The block will be built of white bricks, with red brick dressings, and the roofs will be of Bridgwater red tiles. Each cottage will have a garden in front, facing the road. The homes have been designed by Mr. Jas. Archbold, engineer to the Stella Coal Company, and will be built by Mr. Peter Fellowes, Greenside.

TRURO CATHEDRAL.—The Truro Cathedral General Building Committee met on Thursday in last week to consider the question of the materials used in the foundation of the nave at present being laid. Several leading members of the committee who had frequently visited the works criticised freely the kind of stone used; but the clerk of the works (Mr. Caine) expressed his opinion that good stone had been employed by the contractor. Mr. Codd, the representative of the architect (Mr. J. L. Pearson, R.A.), had come down from London to inspect the foundations, and had subjected the concrete laid to some severe tests with satisfactory results. It was also stated that the materials used at present were the same that had formed the foundation of the part of the cathedral already erected, and

had proved perfectly sound. The committee decided—(1) That specimens of the concrete already laid should be subjected to some scientific test under Mr. Pearson's supervision; (2) that for the rest of the foundations of the nave now in progress hard stone only should be employed for the concrete; (3) that for the present the work should proceed no further than just below the floor level.

CHIPS.

The Dean and Chapter have just erected in the crypt of Canterbury Cathedral a marble tablet, "To the beloved and honoured memory of William Archibald Scott-Robertson, M.A., hon. Canon of this Cathedral, as a mark of gratitude to one who ungrudgingly devoted to the service of the Cathedral his faithful labours and his abundant antiquarian knowledge."

At a meeting of Glasgow District Lunacy Board on Friday, a committee was granted powers to visit nurses' homes in Glasgow and district before deciding upon the design of the proposed nurses' home at Gareloch Asylum. The building, in which will be accommodated the whole nursing staff, it is estimated, will cost £7,000, exclusive of furnishing, and no asylum in Scotland has at present such a home in connection with it.

A new Masonic hall in St. Nicholas-street, Worcester, was opened with much ceremony on Tuesday. It contains an assembly-hall, provincial museum, large dining-room, and other adjuncts, and the ground-floor is arranged in lock-up shops.

Colonel Heffer, C.E., inspector of the Local Government Board, held an inquiry at Shuttington on Tuesday, in reference to an application to borrow £550 for laying water-mains in the village, to join those at Amington, in the Tamworth water area. Mr. H. J. Clarkson, surveyor to the Tamworth Rural District Council, explained the scheme.

At Messrs. Hilton, Anderson, and Co.'s cement works at Halling, near Rochester, on Tuesday, a large kiln containing about 200 tons of boiling cement overturned, knocking down other kilns, and wrecking a shed. Three men, named Stevens, Atkins, and Chittenden, were seriously injured, and it is feared Stevens will not recover.

The principal business transacted by the Gloucester City Council at its meeting on Tuesday was the decision to borrow a sum not exceeding £50,000 for the provision of a public electric-light supply and refuse destructor. A committee of six was appointed, and after the meeting they set off on a tour of inspection of electric-light works at Newport, Reading, St. Pancras, Shore-ditch, Leyton, Tunbridge Wells, Hampstead, Leicester, Oxford, and Cheltenham. Mr. Robert Hammond, of London, was appointed engineer to the scheme.

The interesting old timber church at Lower Peover, Cheshire, celebrated its 601st anniversary on Wake Sunday. Additional interest was given to the festival, as a new clock, with Cambridge chimes, has been placed in the tower. The vicar held a dedication service. The clock has been made by Messrs. J. Smith and Sons, Derby.

A special meeting of the Highland Railway shareholders was held on Wednesday. Sir G. Macpherson Grant, the chairman, explained that the meeting had been called to authorise the raising of new capital, under the Company's Act of 1895. There were several causes why additional capital was required. The Aviemore and Kyleakin lines still remained to be completed. The Aviemore line had now been opened as far as Daviot, within seven miles of Inverness, and pressure was being brought to bear on the contractors for the completion of the remaining portion as rapidly as possible. The Kyleakin extension, by which the system would be placed in closer touch with Skye, was approaching completion. It was also necessary to build a pier at Skye, so that the steamboat or other ferry might be established. It was agreed to issue £200,000 preference stock and £100,000 debentures, as recommended by the directors.

An interesting ceremony took place within the City Chambers, Glasgow, on Tuesday, when the portrait, commissioned by the corporation, of Councillor Alexander Osborne, the "Father" of Glasgow Town Council (having been a member of that body since 1862), and a replica for Mrs. Osborne, were unveiled in the banqueting-hall. The portraits have been painted by Mr. James Guthrie, R.S.A.

Mr. John Sharman, formerly chief engineer of the London and North-Western Railway, was drowned while bathing at Morecambe on Tuesday afternoon.

At a sitting of the Glasgow Uninhabitable Houses Committee on Tuesday, 83 houses were ordered to be closed up. These included practically all the houses which were occupied in the Old Wynd and the larger part of Meuse-lane, two of the meanest streets of the city.

KNOCKDERRY CASTLE.—SELECTED DESIGN FOR NEW
WESLEYAN COLLEGE, SCARBOROUGH.—HOUGHTON TOWER,
LANCASHIRE.—NEW CHURCH AT BENTLEY, NEAR DON-
CASTER.—INDUSTRIAL SCHOOL, HAGEN, WESTPHALIA.—
KING EDWARD'S GRAMMAR SCHOOL, MORPETH.

Our Illustrations.

KNOCKDERRY CASTLE.

THE drawing shows the addition, which consists of a music-room with open roof, library, and bedroom accommodation. From the parapet which goes round the tower magnificent views of Loch Long and the mountain scenery are obtained. The castle rises from a rocky foundation, which is high above the level of the Loch. Mr. J. S. Templeton is the proprietor. Mr. W. Leiper, R.S.A., is the architect. The drawing was on view at the Royal Scottish Academy's Exhibition at Edinburgh a few months since.

NEW COLLEGE, SCARBOROUGH.

THIS design was selected in the recent competition at Scarborough. The college is to be built on Filey-road, overlooking the south bay. The materials to be used are red brick and Whitby stone, roofs to be covered with red tiles. The architects are Messrs. Hall, Cooper, and Davis.

HOUGHTON TOWER, LANCASHIRE.

WE gave a view of this house, showing the dining-hall exterior in the inner court on August 20, when other illustrations appeared in connection with the Architectural Association Excursion in the neighbourhood of Lancaster. We then promised to publish the accompanying measured drawings lent us by Mr. W. A. Waddington, together with some details of the old tables in the dining hall: replete with figured dimensions, these details cannot fail to be of service. The sketch-view of the other side of the old mansion serves to further illustrate its quaintness and interesting character.

NEW CHURCH, BENTLEY, NEAR DONCASTER.

THIS church was opened in the autumn of last year. Its accommodation is for about 400. It consists of a nave 30ft. wide and 60ft. long, with arcades of five arches and aisles, which are passageways only and are but 3ft. wide, the nave and aisle being under one roof. The west end is a composition of three traceried windows of two lights each, separated by massive buttresses, and surmounted by a rose window. The side windows are deeply recessed under the arches of the nave arcades, which, continued north and south, form curtain arches over them. The nave roof is a massive tie-beam roof of pitch-pine, with arched and cusped trusses, purlins with cusped wind-braces, and very deeply carved cornice. The chancel is 36ft. long and 19ft. wide. Its roof is also of pitch pine, with arched principals and trussed common rafters. The bays over the sanctuary are boarded and divided into traceried panels. Vestries and an organ chamber are provided north of the chancel. The entrances are in the western

bay of the nave north and south—on the north through a broad, low, and shallow porch, in the gable of which sits a figure of St. Peter; on the south side through the lower stage of the tower. The tower contains a clock and a peal of bells. The spire rises to a height of 120ft. The building is faced with stone externally; the roofs are covered with plain tiles. The nave is seated with open benches, which are of teak; the chancel stalls are somewhat elaborately treated, and are also of teak. The altar is of oak, with cusped panels; the altar rails are of wrought-iron scroll-work, and are gilt. The pulpit and font are of stone. The east window is filled with rich painted glass, arranged in two tiers of New Testament subjects, with a Majesty over in the centre light surrounded by angels, which fill in the tracery. The cost, including the boundary walls, which are of stone, was about £8,000. The architect is Mr. John Codd, A.R.I.B.A., and the drawing we here reproduce was hung in the Architectural room at the Royal Academy this summer.

INDUSTRIAL SCHOOL, HAGEN, WESTPHALIA.

THIS building, for the Industrial School, Hagen, Westphalia, is erected from the designs of Herr Felix Genzmer, architect. It is reproduced from *Architektonische Rundschau*.

KING EDWARD VI. GRAMMAR SCHOOL, MORPETH.

THE foundation-stone of the new science and art department of this school was laid on July 30. On the ground-floor will be the physical and chemical laboratories, lecture theatre, advanced, balance, and other rooms. On the first floor will be the elementary, life-rooms, model-room, masters' room, and room for manual instruction. The work is being carried out by Mr. T. W. Middlemiss, from the plans and under the superintendence of Messrs. Boulds and Hardy, architects, Morpeth.

A site for a new public free library and reading-room for the Blackley and Harpurhey districts of the city of Manchester has been secured on the borders of the David Lewis Recreation Ground and Blackley new park. The Parks Committee has signified its approval, and plans for the new building will be prepared at once. The library will be constructed to accommodate about 10,000 volumes.

The inauguration of the monumental fountain erected in Brussels to the memory of Jules Anspach, burgomaster of that city from 1863 to 1872, took place on Sunday. The monument consists of a sculptured pediment of white marble, with a bronze medallion and obelisk surmounted by a figure of St. Michael, the Patron Saint of Brussels. It stands in the centre of the new boulevards, and is a fitting tribute to the memory of a citizen who was instrumental in effecting a vast scheme of improvement both from a hygienic and architectural point of view.

Rapid progress is being made with the new wing of the Portsmouth Royal Sailors' Home, situate within a short distance of the main entrance to the dockyard. On the basement of the new building, a bowling alley, 80ft. in length, and a store for bicycles are in course of erection. Her Majesty and members of the Royal Family are warm supporters of the home, and the Empress Frederick, when at Portsmouth a few months since, inspected the new premises, which will be ready for opening in October. One hundred and fifty-nine additional sleeping cabins are to be provided, and, acting under the instructions of the committee, the architect (Mr. Vernon-Inken, of Southsea) has made provision for fixing hydrants, with folding hose and fire-bells, on each floor, in order that the staff of the home might, in the event of an outbreak, promptly cope with it.

Mr. William Forsyth, the surveyor of the District of Columbia, U.S.A., has resigned on account of ill-health and age, and Mr. Henry B. Looker, the assistant surveyor, has been appointed to succeed him. Mr. Forsyth is the oldest living employé of the District of Columbia, having served more than 40 years. He was born in Ireland, and was first engaged in railway building in Belgium. He made surveys for the borough of Brighton, and for many of the parks in London. Emigrating to the States in 1850, he was the next year appointed assistant surveyor of the county of Washington, and in 1857 he was made surveyor.

After a long discussion and a division, the Lancashire Asylums Board decided at their last meeting to authorise a committee to accept a tender for the proposed new county lunatic asylum at Winwith Hall, and to provide temporary accommodation during the erection of that building at one of the existing asylums. Mr. Thomas Beaman, of Chat-ham, was appointed as clerk of works at the new asylum at a salary of £4 a week.

LEGAL INTELLIGENCE.

RE J. ASHWORTH.—John Ashworth, who carried on business as a land agent and builder, at King-street, Manchester, came up for examination at the Manchester Bankruptcy Court on Monday. He said his liabilities were £1,991 and his assets £696, leaving a deficiency of £1,295. He attributed his failure to depreciation in the value of house property. His assets represented the value of equities in properties, and, in his opinion, they were worth that amount. He did not think they were paper assets. He had scheduled the properties at prices he thought they would fetch. He first knew of his insolvency at the end of last year. He had not applied for his discharge in a previous bankruptcy, and he did not know whether his creditors released him, or what dividend was paid. He could not say what his financial position was at any time during the last three years. He had not kept proper books of account. The examination was adjourned.

CHIPS.

The organ at Hebron Chapel, Badminster, has been closed for some months past for repairs and enlargement, and Messrs. Johnson, organ builders, of Dighton-street, Bristol, have added several stops and introduced the pneumatic action throughout. The reopening took place on Wednesday.

The Local Government Board have deferred sanctioning the Romford Urban District Council's application for power to borrow £5,000 for street improvements until the Essex County Council have intimated how much they are prepared to contribute towards the improvement of the footways.

The General Purposes Committee of the Middlebrough Corporation recommend that Victoria-square be laid out and inclosed at a cost of £1,300.

The picturesque "ruins" on the south side of Virginia Water have become unsafe, and with a view to preventing any accident several of the Corinthian columns have recently been dismantled. They were originally portions of a Roman temple near Tripoli, and were brought home in 1825 and arranged as they have since stood by Sir Jeffrey Wyattville.

A commencement has been made in the work of laying a system of pneumatic tubes for conveying letters to nearly all parts of the new city of New York. For many years a small pneumatic service has been maintained between the post office and the upper part of the city; but the new system, which includes three lines southward from 42nd-street, and two lines thence northward to 125th-street, will provide for the transmission of at least 70 per cent. of the postal matter which is now conveyed about the city in mail-waggons.

The Princess Henry of Battenberg, Governor of the Isle of Wight, laid, on Monday, the foundation-stone of a new wing to the Royal Isle of Wight Infirmary and County Hospital at Ryde, erected for the accommodation of ten children patients, and as a commemoration of the long reign of the Queen.

Bishop Wilkinson, of St. Andrew's, Dunkeld, and Dunblane, consecrated a new Episcopal church at Auchtermarder on Saturday. The church, which is named after St. Kessog, is the gift of Rev. Elward Thomas Scott Reid.

The town council of Stamford have held a meeting in committee to discuss the deep drainage scheme prepared by Mr. James Mansergh, M.Inst.C.E. After a lengthy discussion, a motion in favour of the abandonment of the scheme was carried by an overwhelming majority, and the town clerk was instructed to write to the engineer for his bill of expenses.

The Marquis of Londonderry has received applications for shares in his projected company for the development of Seaham Harbour to the amount of more than double the probable capital. Mr. H. H. Wake, the engineer to the River Wear Commissioners, has completed his preliminary survey in connection with the scheme, which is said to embody a harbour of refuge.

Mme. Louise Marie Roederer, of Rheims, who died on Feb. 6, the widow of M. Charles E. Roederer, has bequeathed to the Rheims Cathedral her painting, "The Assumption," by C. L. Müller, and to the Church of St. Geneviève, of Rheims, her large painting representing St. Germain and St. Geneviève.

Mr. Hamo Thornycroft's statue of Oliver Cromwell, destined to be set up at Westminster, is very nearly completed. The *Athenaeum* says that it is characteristic and expressive, and represents the Protector standing with one hand upon the sword at his side, holding a Bible in the other. His head is bare, and his felt hat—which, of course, is of the shape affected by the Puritans of his time—is under his arm, while, as if lost in thought, he looks moodily down at the ground at his feet. The likeness of the face, derived largely from the death-mask, is strikingly faithful.

Engineering Notes.

NEW NAVAL DOCKS AT THE CAPE.—Definite plans for the erection of new docks, basins, and coaling jetties at Simon's Town are now engaging the attention of the Admiralty. The scheme is a large one, and will, if approved, have a strong influence on the fortunes and progress of the naval port. They involve an expenditure of some £2,500,000, although they have been so drawn up that the scheme will admit of modification and curtailment if considered desirable. Mr. Shield, the civil engineer who had been sent to Mauritius to draw up plans for docks by the Admiralty, called at Simon's Town on his way back, and his scheme, which has been approved by the Commander-in-Chief at Simon's Town, is at present under consideration. It is tolerably certain that docks will be constructed at Simon's Town; but the actual site, the date of commencement of the work, and plans to be followed are matters on which no decision has yet been arrived at. The docks, if constructed, will take the largest ironclad afloat, and it is possible that an arrangement will be come to with the harbour board, under which the Royal Navy shall be entitled to a prior claim on the Capetown Dock in time of war. For the construction of extensive docks for the navy, Capetown is, of course, utterly unsuited. It is anticipated that the new reservoir at Simon's Town, which has a capacity of 40,000 tons of water, will be completed in the course of a couple of months. The reservoir, which has been constructed by the Imperial authorities, will be an immense benefit to the port and to the ships, and will obviate the possibility of drought for the future.

CHIPS.

The Princess Henry of Battenberg visited Whippingham Church on Tuesday to inspect the screen being placed in the Memorial Chapel by Mr. Alfred Gilbert, R.A.

The Chancellor of the Exchequer has informed the executors of the late Sir Wollaston Franks that he will remit the estate duty on the bequest to the British Museum, and the collections bequeathed with the condition that the duty should be remitted have now been handed over to the trustees of the British Museum. So large an accession will involve a rearrangement of some of the galleries, and this will be effected in a few weeks, when the whole of this magnificent bequest will be shown to the public.

A stained-glass window in memory of Dr. William Robertson Smith, late professor of Arabic at Cambridge, was unveiled on Tuesday in King's College Chapel, Aberdeen. The four principal lights of the window contain figures of the Hebrew prophets, Isaiah, Jeremiah, Ezekiel, and Daniel. Mr. A. Marshall Mackenzie, A.R.S.A., designed the windows, and the cartoons for the figures were drawn by Sir Edward Burne-Jones. The Marquis of Huntly, Lord Rector of Aberdeen University, of which Professor Robertson Smith was a graduate, performed the ceremony of unveiling in the name of the subscribers.

On Thursday evening in last week the new organ, presented to St. Agnes' Church, Birch, by the congregation, was dedicated for divine service. The cost of the instrument is over £500. The builders were Messrs. Jardine and Co., of Manchester.

The Congregational mission buildings on the Victoria Estate at Wellingborough have just been reconstructed from plans prepared by Messrs. Sharman and Archer, of that town. The infant school fronting Ranelagh-road has been converted into a chapel seated for 400 persons, and new infant school and vestries have been added. Mr. C. W. Abbott, also of Wellingborough, was the contractor, and the outlay has been under £700. Reopening services took place last week.

The Yarmouth magistrates have granted a provisional license for an hotel to be known as the Cliff Hotel, Gorleston. The proposed expenditure is £25,000; there will be sixty bedrooms.

At the last meeting of the Mersey Dock Board it was decided to provide deep water and improved shed accommodation at the Huskisson Dock and Huskisson Branch Docks at an estimated cost of £86,700, and to accept a tender for the supply of wrought steel and ironwork for the extension eastward of the double-story shed at the west end of the north side of the Huskisson Branch Dock No. 2.

The work of repainting and redecorating Blackfriars Bridge has just been commenced, and is expected to occupy a staff of 60 workmen about three months. Messrs. Harrison and Spooner, College-street, E.C., are the contractors.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 382, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX, XL, XLI, XLII, XLIII, XLIV, XLV, XLVI, XLVII, XLVIII, XLIX, L, LI, LII, LIII, LIV, LV, LVI, LVII, LVIII, LIX, LX, LXI, LXII, LXIII, LXIV, LXV, LXVI, LXVII, LXVIII, LXIX, LXX, LXXI, LXXII, may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

PUBL.—Some mistake. Architects are not registered or licensed yet. We hope they will be some day.

RECEIVED.—F. C. R. and Co.—H. T. G.—W. D.—H. B.—C. and A. B. (Bristol).

Correspondence.

POOR MORTAR.

To the Editor of the BUILDING NEWS.

SIR,—You reported (p. 313) the conviction of a builder, at the instance of the Corporation of Southampton, for the use of mortar not in accordance with the by-laws. I don't doubt the correctness of the decision, as it appears that the sand had a considerable mixture of unctuous, clayey earth, which would cause the mortar to crumble very quickly after its first setting. The clayey particles are soon dissolved on the surface of the work by the action of rain, and disintegrated by frost. This accounts for the squalid appearance of so much of our modern brickwork; it is merely a question of dirty or too fine sand. If only clean sharp sand be used, free from clay, then the bricklayer cannot cheat the mortar of its proper quantum of sand. Were he to attempt to do so, the mortar would be so "short," and would run off the trowel so quick that he could not use it, much less strike a joint with it. Here is the real question for the use by the cheap (and nasty) builder of dirty sand. The dirt takes the place of the lime, and makes the mortar "fat" with less lime. Take care of the cleanness and sharpness of the sand, and the (quality of the) lime will take care of itself.

The above by the way only. Why I write is to comment on the evidence of the building inspector, who said that "mortar deteriorated by being kept after mixing." How does that square with the method of the old Romans, who mixed their mortar and then buried it in pits for two years before

using it, with such excellent results that we now, so many centuries after, find it harder than the stones and brick which it joins. It would be interesting to know whether the inspector's knowledge is derived from experience in buildings, old as well as new, or merely from books and exam. crams.—I am, &c., A. H.

INCOME-TAX OVERCHARGES.

SIR,—The interest which has been aroused in regard to Income-tax by the correspondence in the *Times*, and the articles which have appeared in a large number of other metropolitan and provincial papers, has resulted in calling attention to many grievances which taxpayers suffer; but there is one practice of the Inland Revenue Authorities which we think quite unjustifiable, and which seems to have been overlooked. The practice referred to is that of sending to traders and others at this period of the year a blue notice of charge, showing an assessment of profits at £160, and allowing the whole by way of abatement, no tax being demanded in respect of the business profits. Of course, where those who receive such notices have no income from any source other than their business, no injustice is done; but in the case of such as have income from other sources from which tax has already been deducted, the effect is to bar their right to claim repayment, unless the assessment of the business profits be appealed against, the full abatement having already been allowed.

It is, therefore, of the utmost importance that those of your readers who are now receiving notices of charge for the year 1897-8 should, if the amount at which they are assessed is greater than the average of their profits for the three years ending April 5, 1897 (or at such a prior date as they usually make up their accounts), at once give notice of appeal in accordance with the instructions on notice of charge. Moreover, if they find that the profits of the three years named show an average profit less than the amount upon which they paid tax for 1896-7, they should give notice of appeal in respect of that year also, and claim repayment of the amount overpaid. There is no time to lose in business appeals, as this class of claim for repayment should have been made before now; while a claim to set off a loss in farming or business against income from other sources must be lodged before October 6th next.

Many people are now entitled to make a claim on one ground or another for three years to April 5th last, and the tax recoverable might amount to £38.

We are at all times happy to advise your readers whether they can make a claim, on their sending us full particulars of their income and a stamped envelope for reply.—We are, &c.,

THE INCOME-TAX ADJUSTMENT AGENCY.
12 and 13, Poultry, London, E.C., Sept. 1.

The Health Committee of the Sheffield Town Council have appointed Mr. James Jackson, scavenging superintendent under the Huddersfield Corporation, to the charge of the similar department at Sheffield. The Huddersfield salary was £175 per year, and the Sheffield stipend is £225, rising by £25 each year until £300 is reached.

The corporation of St. Helen's, Lancs, having applied to the Local Government Board for sanction to borrow £67,323 for various projected works, Colonel W. Langton Coke, M.I.C.E., held an inquiry yesterday (Thursday) into the matters concerned at St. Helen's Town Hall. It is intended by the corporation to borrow £20,223 for increasing the water supply to the town by erecting a pumping station on the site at Melling, near Ormskirk, purchased some time ago; £25,000 is required for the extension of the gasworks; £17,000 for extending the electric-lighting plant; £2,600 for paving streets, and £2,500 for the alterations to the town-hall.

Since the Court of Session at Edinburgh rose for the summer vacation, Messrs. William Bryden and Sons, George-street, Edinburgh, have been engaged, under the direction of Mr. W. Wybrow Robertson, H.M. Board of Works, in fitting up an installation of electric lighting in the various courts and other rooms. The hall is to be lighted by 43 32c.p. lamps fixed to the bottom of the pendants of the ornamental oak ceiling. These will be lighted in eight circuits of six lamps each. All the court-rooms, eight in number, will be lighted with electricity, as well as the judges' retiring-rooms, the advocates' robing-room, the entrance hall, and other places. The whole contract includes 204 lights of various candle-power, equivalent to 640 lights of 8c.p.

Intercommunication.

QUESTIONS.

[11764].—**Size of Girder.**—What is the best and most expeditious way of calculating the weight of brick-work, flooring, &c., to be supported on iron or steel joists fixed at both ends, so as to calculate the necessary size of joist to be taken from a well-known maker's catalogue? Suppose the above to be a section through a shop-front.

I should like to have the calculations for determining the size of girder at A, span of girder 22ft. Any other particular will be thankfully received by—A STUDENT.

[11765].—**Architect's Claim.**—Some time ago I prepared plans for a three-story building in a neighbouring town which were carried out. The joiner contractor had a friend who was to build also, and he (the joiner) made an exact copy of my plans off the working drawings, for a two-story block, which has been carried out. All conform to mine. Can I make any claim against the joiner, or against his friend, for this piece of work? An early reply will be much esteemed.—A YOUNG ARCHITECT.

[11766].—**Dumpy Level.**—What differentiates a dumpy level from any other level? What is the exact meaning of "dumpy," as applied to a level?—W. M.

[11767].—**Magnesium Cement.**—I shall feel obliged if some reader of the "B.N." will kindly inform me what the ingredients are for making this cement.—AN OLD SUBSCRIBER.

[11768].—**Measuring Ditch.**—Can any of your readers inform me what is the distance allowed in different counties from grower to edge of ditch when the latter is not well defined, and whether there is any book or pamphlet published giving this information? The practice varies, I believe, in different parts of the country.—SURVEYOR.

[11769].—**Mathematical.**—In the regulations for the guidance of surveyors issued by the Cape Colonial Government, one of the sections reads as follows:—Par. 6, § d. "The positive directions of the axes to which

co-ordinates stated on any document are referred, shall be such, that positive angles increase in the same direction in which the angles increase from 0° to 360° as marked on the horizontal circles of theodolites." This method seems so plain and natural that one is surprised that in works on coordinate geometry the reverse should be practised. Will one of your mathematical readers please give an explanation?—M.

[11770].—**Greenhouse Stove.**—I have a stove which heats my greenhouse. The inside of the furnace is circular (18in. in height, 12in. in diameter). I have been using coke, but wish to use gas. Can any reader suggest a plan for applying same? The inside of the furnace can only be approached by the usual door (about 4in. square).—AMATEUR.

REPLIES.

[11745].—**Artificial Stone.**—Not knowing the exact shade of Dumfries red sandstone, I cannot do more than give a general formula, what is this?—Select a sand as near the colour you wish to imitate, and mix this dry with equal parts of Portland cement (by measure), and moisten the mixture with a saturated solution of sulphate of iron or green vitriol or green copperas, as this salt is called by druggists; this sulphate will redden the sand, and give it a deeper colour, because the sulphate of iron will become converted into iron carbonate, and eventually into iron or red oxide of iron on its exposure to the air.—H. C. S.

[11746].—**Drainage of Street House.**—Speaking from personal experience of a leakage due to defective jointing of the drain-pipes, I would strongly recommend "Householder" to adopt the most sensible plan of having

the defective drain-pipes repaired and cemented in. It is needless to describe my own experience through breathing the foul emanations that at times oozed up from the floor of the room from the defective drain-pipes laid underneath. Suffice it to say that the stench, and sometimes almost odourless sewer-gas nearly sent the writer and his family into the next world. One curious sensation of breathing these fumes was as if our heads were being cramped or squeezed in a vice. Where the writer lives, a village fast becoming a town, containing about 10,000 inhabitants all told, there are thirteen doctors, who make a fat living out of the extraordinarily numerous cases of illnesses rife in the parish. Most of these illnesses are due to defective drains, and those which are not are due to the houses being built on a clay soil or else dustbin rubbish.—H. C. S., Erdington, Warwickshire.

[11751].—**Trigonometry.**—This question is not fully

stated; but taking the column to be upright, the solution is obvious, as sketch will show.

$$\text{Distance} = \cot. 45^\circ \times (60 - 5) = 1 \times 55 = 55\text{ft.}$$

—NO SIG.

[11751].—**Trigonometry.**—"Student" does not say whether the calculated distance is to be worked out geometrically or arithmetically. Here is a geometrical solution.—Erect a perpendicular A B, and measure it into 60 equal parts at C (five of these parts for the foot of the perpendicular), draw an indefinite line, C D, perpendicular (i.e., at right angles) to A B, then from the point A draw a line, A E, at an angle of 45° with A B, cutting the line C D in F, then the length of C F will be the distance required, calculated accurately to the equal parts into which A B is divided.—H. C. S.

[11751].—**Trigonometry.**—Let A B represent the pillar; let A C = C B = 30ft.; let A D = 5ft., the height of the eye; then the observer's eye must be somewhere in

the horizontal line D E; let C F be drawn at right angles to A B, and let C F be made = C B = 30ft.; then the circle described with F as centre and F A or F B as radius will cut D E at E, the position of the observer's eye; for, join E A, A B, then—

$$\text{angle AFB} = 2 \text{ angle AEB (Euc. III. 20)}$$

that is— 2 angle CFB = 2 angle AEB

$$\therefore \text{CFB} = \text{AEB}$$

$$\therefore \text{AEB} = 45^\circ$$

$$\text{Now— } \text{FB}^2 = \text{FC}^2 + \text{CB}^2 \text{ (Euc. I. 47)}$$

$$= 2 \text{ CB}^2 = 2 \times 30^2 = 2 \times 900 = 1800.$$

Again, draw F G perpendicular to D E, then—

$$\text{GE}^2 = \text{FE}^2 - \text{FG}^2 = \text{FB}^2 - \text{FG}^2$$

$$= 1800 - 25^2 = 1800 - 625 = 1175$$

$$\therefore \text{GE} = \sqrt{1175} = 34.278\text{ft.}$$

$\therefore$ D E, the required distance = 64.278ft.

If the formulae for compound angles are at our disposal, the problem may be worked as follows:—Using the same figure, let the distance D E = x feet, let angle A E D = θ , and let angle D E B = ϕ .

We have—

$$\tan. \theta = \frac{\text{AD}}{\text{DE}} = \frac{5}{x} \dots\dots\dots (1)$$

$$\tan. \phi = \frac{\text{DB}}{\text{DE}} = \frac{55}{x} \dots\dots\dots (2)$$

Now—

$$\tan. (\theta + \phi) = \frac{\tan. \theta + \tan. \phi}{1 - \tan. \theta \tan. \phi}$$

That is—

$$\tan. 45^\circ = \frac{\tan. \theta + \tan. \phi}{1 - \tan. \theta \tan. \phi}$$

$$\therefore 1 - \tan. \theta \tan. \phi = \tan. \theta + \tan. \phi$$

Substituting the values of $\tan. \theta$ and $\tan. \phi$ from equations (1) and (2), we have—

$$1 - \frac{5}{x} \cdot \frac{55}{x} = \frac{5}{x} + \frac{55}{x}$$

$$\therefore x^2 - 275 = 5x + 55x = 60x$$

$$\therefore x^2 - 60x = 275$$

$$\therefore x^2 - 60x + 30^2 = 275 + 30^2 = 275 + 900 = 1175.$$

$$\therefore x - 30 = \pm \sqrt{1175}.$$

$$\therefore x = 30 + \sqrt{1175},$$

as before, the only admissible answer.—J. C. PALMER.

[11752].—**Cement for Marble.**—"Marmo" does not say what is the kind of marble he wants to cement,

whether white statuary or a coloured marble. In the writer's book on "Cement, Pastes, Glues, and Gum" (published by Crosby Lockwood and Co. at 2s. 6d.) there are a dozen recipes or so for cementing marbles of all kinds. For white marble, dissolve alum in water until no more alum will dissolve, then mix the alum-water with plaster of Paris, and bake the mass in a hot oven until it is dry and hard, then reduce this hard mass to powder, and use it as required by mixing the powder with a little water pigment. This cement may be coloured with any mineral.—H. C. S.

[11754].—**Student's Exam. R.I.B.A.**—I have found the following books very useful, and probably "W. R. H." would do well to work them up thoroughly, selecting such portions as are indicated in the syllabus of the Institute exams. It may be observed, however, that the examiners do not confine themselves strictly to the syllabus laid down, nor to any particular textbook, but appear to require a very sound and thorough knowledge of general principles, and of the various subjects as far as indicated in the syllabus:—*Classic Architecture.*—W. H. Leeds' "The Orders" (Weale's Series), Smith and Slater's "Classic and Early Christian Architecture," Spiers' "Orders of Architecture," *Gothic Architecture.*—Parker's "Glossary of Terms," Parker's "Manual of Gothic," Rickman's "Styles of Architecture in England," T. R. Smith's "Gothic and Renaissance Architecture," *Science Section.*—Seddon's "Builders' Work," Rivington's "Notes on Building Construction," Vols. I, II, and III., or Mitchell's "Advanced Building Construction," Magnus's "Lessons in Elementary Mechanics," Usill's "Practical Surveying," Angel's "Advanced Geometry and Projection." Besides the above, Gwilt's "Encyclopedia of Architecture" will be found useful for reference on particular subjects. A more complete list of works will be found in the Institute syllabus.—H. BUSBRIDGE.

[11755].—**Architect's Drawings.**—The client and builder will still sign their names at one corner of each drawing; but it will be sufficient to get them to sign the agreement or contract referring therein to the drawings, which may be numbered.—AJAX.

[11757].—**Asbestos.**—If "A Constant Reader" obtains the particulars from the company, he will get all the information he requires. There is no difficulty as to using, and it will answer as well on brick as on laths. Metal laths are particularly good, as they make a very secure "key," the plaster going through the apertures and expanding behind. The "expanded metal laths" make a capital groundwork.—A. J.

[11757].—**Asbestos.**—"A Constant Reader" can obtain all information, and see specimens of asbestos plastering laid on many kinds of surface of Messrs. Witty and Wyatt, 86, Leadenhall-street.—A. M.

[11761].—**Boundary Walls.**—It would certainly be best to build the walls in horizontal courses from stepped foundations, and not to course parallel with the falling roadway. The latter would not only be ugly, but would have a tendency to slip in the direction of the fall. Finish the tops with ramps, as you yourself suggest, or with piers. If concrete be used at the foundations, see that its continuity is not broken at the steps, but that it is there overlapped.—A. H.

[11761].—**Boundary Walls.**—The foundations should be cut in long steps, according to the fall of roadway, by which means the quantity of brickwork is saved. The courses are, of course, on this plan laid level. There are several modes of construction. The top of wall is sometimes simply formed in steps, forming a kind of step-like embrasure, the horizontal portions weathered or coped, and the vertical ends built with square end, the coping being made to stop against it. In some parts of England, as in Sussex, we find a very nice wall built of flint or rubble, with brick copings and dressings at ends of each ramp. Sometimes the wall is panelled, the red brick being built all round a rubble centre. On the Continent, the top of wall is weathered by tiles, with cresting, these stopping dead against the upright ends, and the effect is pleasing. Walls of the local rubble or flint, the angles and plinths and copings and angles of walls being of dressed stone, are handsome, and at Eastbourne and Folkestone these walls are commonly used to inclose the villas and large residences. As regards cost, the saving in building with raking courses would be slight, as such walls are less durable than the ramped.—G. H. G.

[11761].—**Boundary Walls.**—There are several ways of building boundary walls. If the ground or roadway falls, or has an inclination, the best way is to ramp it at intervals; the greater the fall, the more numerous the ramps. Walls are sometimes built in courses parallel to the roadway when the fall is not great; but such never look well. The ramps should be finished by curves in the ordinary manner; but a better and more effective wall has piers built at the various steps, or changes of height, which piers, give both strength and appearance. These piers may be 18in. or 22in. square, according to the thickness of wall. Of course, this method of ramping is the most costly. In the ramped plan the foundations are stepped to the incline, and the courses made level.—CRASTER.

The 49th annual report of the Operative Bricklayers' Society shows that the society has made steady progress during the past year. The members have gained the following increases in their wages:—Six towns 1d., 22 towns ½d., and three towns ¼d. per hour. Next year will be the Jubilee year of the society, and there is one member surviving who entered in 1848—viz., James Garland, of the Lambeth branch.

The death is announced of M. Léon Gautier, the eminent palaeographer. Born at Havre in 1832, he entered the Ecole des Chartes in 1855, and, on the completion of his studies, was appointed archivist of Haute Marne. In 1859 he received a post in the National Archives, and in 1871 he became Professor of Palaeography at the Ecole des Chartes. In 1887 he succeeded M. Natalis de Wailly in the Academy of Inscriptions.

WATER SUPPLY AND SANITARY MATTERS.

MANCHESTER.—The city council, at a late meeting, again had under consideration the problem of how to dispose of its sewage. The artificial filtration scheme reported upon by Mr. T. de Courcy Meade, the city surveyor, was discussed, and the cost of it was declared to be prohibitive—viz., first cost of the proposed filters to deal with the tank effluent, £275,000; annual outlay in renewing the filtering materials, £31,820; working expenses per annum, £5,220. The Rivers Committee have advised that the culvert scheme be reverted to, the effluent after chemical treatment to be taken to the tidal waters of the Mersey. This scheme was explained in detail at Wednesday's meeting of the city council. The proposal is to construct a culvert 16 miles long, extending from the sewage works at Davyhulme to the estuary of the river Mersey. It was explained that, if Parliament granted permission for the undertaking, the culvert would be used, not for the purpose of conveying the crude sewage of the city into the river, but the effluent, which would have no deleterious effects whatever upon the water. The cost and maintenance of the culvert was estimated at £258,000, or much less than the expense attending upon artificial filtration. The deputy chairman of the Rivers Committee, Mr. Saxon, said that one great argument in favour of the scheme was that it would be definite and comprehensive, and provide a clear way out of their difficulties. It was also mentioned that plans for a similar culvert had been passed by Parliament, at the instance of the Glasgow Corporation, for discharging the effluent of that city into the Clyde. The council, with a few dissentients, adopted the proposal, and authorised application being made for Parliamentary powers.

PORTSMOUTH.—Efforts have been made by the Portsmouth Town Council to acquire the water-supply of that town. The directors of the water company have been communicated with, and it has been ascertained that the purchase would cost more than a million sterling. The Local Government Board have been asked to extend the time for the repayment of the money, which would have to be borrowed from sixty to eighty years, but they decline to do so, and intimate that they should oppose any such proposal if embodied in a Bill. Recently, attention has been directed to the water company's charges, and the opinions of counsel have been taken. Mr. Asquith, Q.C., and Mr. Cripps, Q.C., are of opinion that the company are not justified in charging upon the gross value of the houses, but that their assessments should be based upon the rateable value. Sir Edward Clarke, Q.C., inclined to the view that the company are authorised under the provisions of their Act, which was passed in 1857, to charge upon the rent, but was not very positive upon the point. The special committee having the question of water purchase in hand are about to submit the legal opinions to the town council, and to ask for further instructions.

THE WELSH WATER SUPPLY FOR BIRMINGHAM.—The members of the Association of Municipal and County Engineers, with their president (Sir A. R. Binnie, Chief Engineer to the London County Council), on Saturday visited the works which are in progress in the Elan Valley (Mid Wales) for the supply of water to the City of Birmingham. The visitors were received by Mr. James Mansergh, the engineer, who, with his staff of assistant engineers, conducted them over the works, and explained the various points of interest of what is the largest water supply scheme which has yet been undertaken by any municipality in England. On the conclusion of the visit, Mr. Mansergh entertained the party to dinner in the Public Hall in the Elan Village. Sir A. R. Binnie, in proposing the health of Mr. Mansergh, said they had had an opportunity of inspecting one of the largest engineering works of their time. It was his and Mr. Mansergh's fate many years ago to first visit that district on works of another kind, and since that time they had always carried with them the most pleasant recollections of the time they spent in Mid-Wales. Mr. Mansergh, in replying, said that when 35 years ago he and Sir Alex. Binnie were surveying the Cambrian Railway, they both of them chose the Elan Valleys as sites for reservoirs, and if he (Mr. Mansergh) had not got a little ahead for Birmingham, no doubt Sir Alexander Binnie would have seized on that site for London.

At Grimsby last week, a memorial stone was laid of a girls' school for St. Andrew's parish, now being built in Strand-street. Mr. F. S. Kelton, of Grimsby, is the architect, and Mr. Hewins is the builder.

The Dingwall Town Council have decided to adopt the electric light, the scheme submitted by Mr. R. F. Yorke, of Glasgow and Stirling, being the one accepted. This scheme includes Strathpeffer also, and the two places will be worked from one centre. The water-power will be obtained from the river Peffry.

Our Office Table.

The Corporation of Walsall has arranged to hold the first exhibition of oil pictures in the Borough Art Gallery during the coming autumn. It will be opened on October 4 and closed on January 1, 1898, the "sending in" days being September 16 and 17. Should this exhibition be a success, it is proposed to repeat it annually. The nucleus of a permanent collection for the town has already been formed, and the arts committee, following the plan adopted by Liverpool, have decided each year to purchase pictures from the autumn exhibition.

The sudden stoppage of Big Ben one day last week was not, it seems, due to eccentricity, but was the result of accident pure and simple. The large cap, or nut, weighing 13lb., which fastened the hands of the south dial, became unscrewed, probably on account of the vibration caused by the striking of the great clock. On being released the piece of metal fell upon the official residence of the Serjeant-at-Arms, a distance of 200ft., penetrated one of the iron plates of the roof, and lodged in the ceiling below. The clock continued on its course, but, as there was a possibility of the hands falling away, the south dial was stopped. The makers were communicated with, and soon succeeded in replacing the nut.

MR. RICHARDSON EVANS, the hon. secretary of the National Society for Checking the Abuses of Public Advertising, calls attention to the fact that one of the shot towers near the approach to Waterloo Bridge has been disfigured by huge letters advertising the trade of Mr. Dewar, one of the persons designed for the post of Sheriff of the City of London during the coming year. Mr. Evans appeals to the Sheriff-elect to remove this colossal eyesore from a once picturesque feature of Thames-side, adding: "One who occupies a conspicuous place in municipal life is under a particular obligation to abstain from affronting his fellow-citizens. As matters stand, it must be thought that Mr. Dewar is wanting either in perception or public spirit. He demonstrates his unfitness for civic honours if he is content to say that he will do all that the defects of the law will allow him to do towards destroying the dignity and beauty of the city which he professes a desire to serve."

PREPARATIONS have now been completed for holding at Leeds the 16th Congress and Exhibition of the Sanitary Institute, which will open on Wednesday week, September 14, with a reception of the members, who are expected to number 1,200 or 1,300. A strong local committee, of which Sir James Kitson, M.P. (Lord Mayor of Leeds), is chairman, has been formed, upon which upwards of 1,000 of the leading men in the county have placed their names. Dr. Robert Farquharson, M.P., has been appointed president of the congress, and among the vice-presidents are the Duke of Norfolk, Marquis of Ripon, Bishop of Ripon, Dr. Eden (the new Bishop of Wakefield), the Earl of Scarborough, Earl of Cranbrook, Earl of Harewood, and Lord Halifax. On the opening day, after the reception by the Lord Mayor and a public luncheon, the president will deliver his inaugural address, and in the evening the Lord Mayor of Leeds will open the Exhibition buildings to the public. The remaining days will be occupied with discussions in conferences and sections on "River Pollution," "Municipal Work," "Sanitary Work," and, for ladies, "Domestic Hygiene." More than 700 delegates have been appointed by the universities, learned and scientific societies, county, urban, and district councils, and other public bodies, to follow the discussions.

The annual report of the borough surveyor of Stockport, Mr. John Atkinson, A.M.Inst.C.E., states that during the twelve months ended March 31, 1897, 187 plans were submitted for approval, including four places of worship, one school, ten factories, and 440 houses, the total being slightly above the average for the past few years. The buildings, for which plans were approved during the past year, have mostly been commenced or completed, with the exception of about 200 dwelling-houses, of which, however, a large quantity are in course of erection. Number of houses actually built, 219; including 162, plans for which were passed prior to March, 1896. Excluding private estates, land for which plans of intended streets have been approved, and the land necessary to be set apart for streets in the

future, the area available in the borough for building purposes at March, 1896, was about 425 acres. The amount absorbed for building operations during the year ending March, 1897, was five acres, leaving an area of land yet unbuilt upon of about 420 acres. Various street improvements are in progress, at an estimated expenditure of about £7,200, in addition to the construction of a main intercepting sewer and outfall works, for which Mr. A. M. Fowler is the engineer, at a cost of about £45,000, gasworks extensions, costing some £36,000, and the building of public baths, £3,000, and weights and measures offices and police parade-room, each costing £2,000. The area of the borough is 2,200 acres, the estimated population 79,000, the density of population being 35.7 per acre, and the death-rate 20.6 per 1,000.

The Thirty-first Annual Convention of the American Institute of Architects will meet in Detroit, Michigan, on Wednesday, September 29, continuing three days. Papers will be read by Professor C. F. Osborne, of Cornell University, Mr. Henry Van Brunt, of Kansas City, and Mr. Cass Gilbert, of St. Paul, on "Architectural Education, and its bearing on Membership in the Institute"; by Mr. R. C. Sturgis, of Boston, on "Church Architecture"; and by Mr. Henry Rutgers Marshall, of New York, on "Architectural Truth." Many radical amendments to the constitution and by-laws will be brought forward by the committee, and some of them are expected to give rise to a considerable amount of discussion.

The *Yale Scientific Monthly* describes a new process of manufacturing mosaic floors. Small particles of wood, such as sawdust, wood, flour, and fine shavings, are treated first with a mixture of shellac and alcohol, and with them a cement made of curd and slaked lime, and, while this mixture is still damp, it is put into hot moulds of the desired shape and size and placed under pressure; the joint action of the heat and pressure unites the wood most thoroughly with both the shellac and the cement, and after a few minutes the compound is taken out of the moulds and completely cooled and hardened. Great care is necessary that no foreign substance, especially of an oily nature, be present, as this would prevent the cement from being absorbed into the pores of the wood. In making different-coloured mosaic the natural colour of the woods used is taken into account, then the wood itself is dyed, and, lastly, dyes dissolved in alcohol are mixed with the shellac. The process is then performed as before. It is said that, notwithstanding its hardness, this compound possesses all the perfection of wood, thus rendering it of particular adaptation for use as a floor-covering in the case of living-rooms and private dwellings, and the advantage is claimed for it of being unaffected by any changes of temperature.

The coming election of the first mayor of Greater New York is creating quite a stir in political circles in that extended municipality. He will rule over a city containing 359.75 square miles and a population of 3,200,000. The Department of Buildings is to consist of three commissioners, each of whom has the power to appoint and remove subordinates. The superintendents of buildings shall, it is ordained, each be a competent architect, engineer, or builder, of at least ten years' practice. The inspectors shall be competent men, either architects, engineers, masons, or carpenters, who shall have served five years as such; but it shall not be lawful for any employé of the department to be engaged in carrying on any such business while holding office in the department. The commissioners shall have the power to pass judgement upon all plans for buildings of any kind, and such plans must conform to the rules and regulations established by the board. An appeal from the decision of a commissioner will be decided by the board. The new city will start with 167,000 buildings, 130,000 of which are residences.

A Wesleyan chapel is about to be built in High-street, St. Alban's, from plans by Messrs. Gordon Lowther and Gunton, of Finsbury House, Blomfield-street, E.C. The contractor is Mr. E. Dunham, of Victoria-street, St. Alban's.

Mr. John Hall, of Newcastle-on-Tyne, ship-owner, has offered £100,000 to build a new infirmary for the city, conditionally upon a site being procured on the Castle Leazes or Recreation Ground, upon the outskirts of the city, and also that the subscribers of the £100,000 already raised to erect a new infirmary on the site of the existing institution allow that money to be devoted to its maintenance.

Trade News.

WAGES MOVEMENTS.

KEIGHLEY.—The joiners of this town have agreed to accept 7½d. per hour, a forty-eight hours week, and overtime to be paid time and a quarter.

NORTH WALES SLATE QUARRIES.—After a strike extending over nearly a year, "bargain-letting" recommenced on Wednesday at Lord Penrhyn's Carnarvonshire slate quarries. There was no friction, and most of the old hands have been re-engaged.

THE STRIKE OF BLACK COUNTRY BRICKMAKERS.—The whole of the yards in the Oldbury and West Bromwich districts which were affected by the recent strike are now in full swing, the discontented section of the operatives having all resumed work. It is very probable that early steps will be taken for the establishment of a wages board, with the view to prevent similar disputes in the future.

CHIPS.

The David Lewis trustees handed over, on Tuesday, to the corporation of Manchester, 19 acres of land at Blackley, to be used as a recreation ground for children. The ground cost £8,000, and the laying of it out about as much more. The whole expense has been borne by the trustees. A similar gift was also made on the same day to the Salford Corporation, the trustees presenting 25 acres of ground at Peel Park, to be used for the recreation of children. The cost has been £16,000.

The parish church of Knutsford is now undergoing considerable repairs and alterations under the superintendence of Messrs. Darbyshire and Smith, of Manchester. The work consists of general repairs to the fabric, new staircases to the north and south galleries, and the removal of the west gallery, together with a scheme of decoration prepared by the architects.

The War Office has asked the sum of £40,000 for the site of the infantry Barracks in Regent-road, which the Salford Corporation has been urged to acquire for the purposes of a recreation ground. It is extremely doubtful whether the Salford Corporation will consent to pay such a price. The area of site is 50,000 square yards.

A new workhouse infirmary is being constructed at Lanchester, Co. Durham, from plans by Mr. J. W. Rounthwaite, A.R.I.B.A., of Mosley-street, Newcastle-on-Tyne.

Disorderly demonstrations took place at Newquay on Tuesday in support of the supposed popular right to the unimpeded use of the headland and the neighbouring heights. A large crowd assembled, and, headed by a band and a flag bearing the Cornish motto "One and All," marched to a spot near the headland, where preparations are being made to build a new hotel. The crowd demolished a tool-shed and board advertising the hotel, and threw them over the cliff into the sea. On Wednesday, the architect of the building, Mr. Silvanus Trevail, of Truro, visited the place. A telegram announcing his arrival had been sent to someone in the town, and the result was that there was a large gathering at the railway station to receive him. Mr. Trevail was followed through the town and hooted; but the police protected him from actual violence.

Mr. Hall Blyth, C.E., the engineer of the new North Bridge, Edinburgh, has informed Lord Provost McDonald and the town clerk that the bridge will be completed next week, and that on an early day in the following week it will be ready for opening.

New Roman Catholic schools have just been completed at 43, Newington-road, Edinburgh. About eighteen months ago the Newington Academy was purchased by Archbishop Macdonald for school premises for St. Columba's congregation, and the work of alteration and addition has now been finished. Two halls have been added, capable of affording accommodation for 200 children, while the entire premises are now sufficient for 350 children. Large covered-in sheds have been utilised for playgrounds, the floors of which have been laid in concrete. A kitchen for the use of the school, as well as cloak-rooms and teachers' rooms, have been provided for. The schoolrooms have been heated by Messrs. Moncur and McKenzie, of Edinburgh.

The Liverpool Corporation formally took possession, on Wednesday, of the tramway system of the city, having paid the sum of £567,375.

The foundation-stones of a new aisle which is about to be added to the parish church of Sacriston, near Durham, were laid on Monday. The church was originally erected between 20 and 25 years ago, and some six years back it was found necessary to add a south aisle. Notwithstanding this addition, the church has again become too small, and it is now intended to build a north aisle, which will increase the sitting accommodation to 535.

New schools at Singlegate, Church-road, have just been opened by the Mitcham School Board. They have been built from plans by Mr. H. P. Burke Downing, A.R.I.B.A., and provide a central hall with classrooms for 240 boys, masters' room, and other accommodation. The building will eventually be doubled in size, and occupies a site of one acre. The outlay has been £4,800.

Messrs. Ramage and Ferguson, of Leith, launched on Tuesday a pneumatic grain elevator, built to the order of the London Grain Elevator Company for use at some docks in London. This is a new method of discharging grain straight from the holds of steamers into barges, the whole process, even to the weighing, being automatically done; while the rapidity of discharge is very much greater than by the ordinary methods, being at the rate of 120 tons per hour. The pneumatic system is known as Duckham's patent, and this elevator has been built under the superintendence of Mr. Hough, consulting engineer to the Grain Elevator Company. The barge is 70ft. by 24ft. by 15ft. moulded, and contains powerful machinery for taking the grain from steamer's holds into barges.

At a sale at Yarmouth this week no less than £5,000 worth of land at Hemsby has been disposed of, and all the indications point to this being the next Norfolk resort to be developed. Hemsby is only six miles from Yarmouth, with a railway station and a good beach. Winterton, a mile beyond, is already well known to picnickers from Yarmouth.

A special service was recently held in the parish church of Frisby-on-the-Wreake, for the purpose of unveiling and dedicating a stained-glass window, raised by public subscription to the memory of the late clerk, Mr. H. Pearson. The work has been carried out by Messrs. Jones and Willis, of Birmingham and London. The window selected for treatment is a Decorated one (cir. 1350), and consists of quatrefoil surmounting two leaf-patterns in the tracery, with three cusped-headed lights below. The figures occupying the three lights symbolise "Faith," "Hope," and "Charity," under canopied work. An angel bearing a scroll inscribed "Holy, Holy, Holy," fills in the quatrefoil, and "A" and "Ω" surrounded by floriated work complete the leaf pattern.

A window, from the studio of Mr. Taylor, of Berners-street, W., has been erected in Pudsey Church, the gift of Miss Beanland, in memory of her father and mother, with the subjects of "Faith" and "St. Lawrence," the patron saint of the church.

A sum of £2,017 has been contributed towards the proposed memorial to the late Archbishop of Dublin. It is proposed to devote a portion of the money to the erection of a public statue.

A new railway-station is to be erected near Shottesbrook Bridge, between Maidenhead and Twyford, on the Great Western Railway.

A workmen's institute, gymnasium, and swimming-bath are about to be built at Abertillery, at an outlay of about £4,000. Mr. F. R. Bates, of Commercial-street, Newport, Mon., is the architect, and Mr. D. J. Davies, of the same town, the contractor.

New Wesleyan schools are being built at Denholme, from plans by Messrs. Judson and Moore, of Oakworth, at a cost of £2,200. The chief contract, that for masonry, is let to Messrs. Sunderland and Greenwood, of Lees.

The rebuilding of Cotham Wesleyan Chapel, Bristol, which was gutted by fire, is rapidly approaching completion, and the church will be reopened in October. Some improvements in the internal arrangements will be effected, and the enlargements will principally consist of the addition of organ and choir chambers, and a church parlour, with an ante-room, all designed in harmony with the other new and the original portions of the building. The architects are Messrs. R. Curwen (of London) and H. J. Jones (Bristol), and Messrs. Stephens, Bastow, and Co., Ltd., of Bristol, are the contractors.

LIST OF COMPETITIONS OPEN.

Sunninghill and Sunningdale—Sewerage Schemes	No premiums	The Clerk, Windsor R.D.C., Park-street, Windsor	Sept. 4
Matlock—Plans and Surveys of all Sewers	No premium	M. A. Sleight, Clerk U.D.C., Matlock Bridge	" 10
Ipswich—Higher Grade School, Tower-st. (local Competition)	No premium; 5 per cent. com.	J. Hepburn Hume, Clerk to School Board, Ipswich	" 14
Battersea—Baths and Washhouses, Battersea Park-road	£100 (merged), £50, £25	W. M. Wilkins, Vestry Clerk, Municipal Bldgs., Lavender Hill, S.W.	" 22
Blaenau Ffestiniog—County Police Buildings	£15 15s.	J. Morris Jones, County Surveyor, Trawsfynydd, Merioneth	" 25
Skipton—Cottage Hospital (16 beds, £2,500 limit—no assessor)	£15, £5	W. H. Dawson, Hon. Sec. to Committee, Skipton	" 30
Morecambe—Sewerage Scheme	£100	Jno. Bond, Surveyor, U.D.C., Morecambe	Oct. 1
Ludlow—Electric Lighting Scheme	£20 (merged)	John H. Williams, Town Clerk, Ludlow	" 1
Lower Bebbington—Sewerage Scheme	£50, £35, £20	Joseph Young, Surveyor U.D.C., 72, Stanley-terrace, New Ferry	" 1
Leeds—Wholesale Dead Meat Market and Abattoir	£100 (merged), £50, £25	John Harrison, Town Clerk, Municipal Buildings, Leeds	" 8
Dorking—Workhouse Infirmary (65 beds, £4,000 limit)	No first, £15, £5	Geo. Scales, Clerk, High-street Dorking	" 13
Eastcote and Northwood, near Ruislip—Sewerage Scheme	£40 for Combined Scheme, £15 for Eastcote, and £25 for Northwood.	G. Woodbridge, Clerk, R.D.C., 33, High-street, Uxbridge	" 30
Mexico—Legislature Palace (1,500,000dol. limit)	15,000dol. Mex.	Secretary Public Works, Mexico City	Nov. 30
Cardiff—Town Hall and Law Courts (A. Waterhouse, R.A., Assessor—£200,000 limit)	£500 (merged), £300, £200	J. L. Wheatley, Town Clerk, Town Hall, Cardiff	Dec. 4
Carlton, Victoria—Children's Hospital	£100, £50, £25	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	(1898) Jan. 30
Briton Ferry—Seven Houses	500dol., 250dol.	Sec., National Sculpture Soc., 215, West 57th-street, New York	(1893) Feb. 28
Newcastle-on-Tyne—New Infirmary (local Architects)	(No first) £150, £100, £50	Secretary, Building Committee, Newcastle	(1893) Mar. 1
Brighton—Artisans' Dwellings (local Architects only)	£75, £25	F. J. Tillstone, Town Clerk, Brighton	" "
Lewisham—Free Library (£4,000 limit)	25gs.	Edward H. Oxenham, Clerk, Town Hall, Catford, S.E.	" "
Boscombe—Hospital Enlargement, Shelley-road	"	J. Pratt, Assistant Sec., 126, Christchurch-road, Boscombe	" "
Tottenham—School Board Offices	"	J. F. Adams, Clerk, School Board Offices, Tottenham, N.	" "
Forest Hill—Free Library (£4,000 limit)	25gs.	Edward H. Oxenham, Clerk, Town Hall, Catford, S.E.	" "

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2227.

FRIDAY, SEPTEMBER 10, 1897.

ADDITION AND ALTERATION TO OLD BUILDINGS.

WHETHER it is expedient for an architect to complete or add to the designs of another, and under what conditions, is a problem that has not troubled the profession to consider, but has been made a topic of discussion at the International Congress at Brussels. The practical needs of buildings require them to be altered and added to as occasion demands. A building is not like a painting or a work of decoration, any alteration or tampering with which would often be destructive to its design or merits. Utilitarian considerations are uppermost and exacting, and therefore any scruples as to integrity of design have to be disregarded. From what we know of old work in Mediaeval and later times, such a question never troubled the minds of the builders of our great edifices—they enjoyed a full liberty to do what they pleased—adding, say, an aisle or a nave to a church built by a previous generation, in quite another style, or even going so far as to tack on to a Gothic church a Renaissance or Classic façade, as we see in many instances, notably in the Parisian churches of St. Etienne du Mont and St. Eustache. In the former of these the later builders certainly did not study the work of their predecessors: they added a western front so completely at variance with the older style that it has evoked the surprise of all who see it. Our own cathedrals show abundant instances of the same indifference, as we may see at Winchester, Durham, St. Alban's, and many other great churches which are historical records in stone;—and do they not become more interesting in consequence? We cannot call them anachronisms, at any rate. They may be wanting in architectural unity of design; but they are epitomes in stone of the changes in national taste. For the last half a century, at least, modern architects have been practising the purist theory of carrying out every restoration in one style, ignoring entirely the process by which all our historical architecture has been produced. In their restoration of 13th-Century buildings they have thought it was necessary to follow that style in every addition and detail, though separated by five or six hundred years from the period when they were evolved. If it was a new transept or aisle, the addition of a new front, or the rebuilding of a decayed tower, the 13th-Century style must be adopted, so that the whole may appear of the same date and character throughout—a make-believe that it was all built at the same time. What a deception! What an anachronical subterfuge to go back so many centuries!—unnatural and contradictory to all that had gone before. And yet this is what our architects are doing now, under the plea of being true to a style, respectful to the old builders. On the contrary, is it not showing them disrespect to imitate their method while adding to or restoring their buildings five centuries earlier in date? We will not strain an analogy by saying it is like copying the English of Chaucer in making an addition to an old book of his age; but it is, at least, a burlesque, or something like it. But there is something to be said for this modern way of restoring the old building when we have no style of our own. Let us take a practical example. We have lately added a nave in the 13th-Century style to the collegiate church of St. Saviour's, Southwark. It has been carefully carried out,

The architect has followed with fidelity the details of the old nave as far as they could be discovered. By our reasoning this was wrong: he ought to have added the nave according to a Victorian fashion, probably a brick structure of wide span, with iron roof, dispensing with the aisles, or he might have selected a much Later style of Gothic to the Early choir and Lady chapel. We suppose the modern advanced cult of architects who think that architecture is the result of the association of the several building trades would have taken this course as the most reasonable and respectful. Be this as it may, we have to face the difficulty of having no style or building method of our own, and so when we have to add to, or restore any ancient building, we think it more respectful to adhere closely to the original. We prefer to show our scholarship—to repeat what is good and beautiful in itself, than to run the risk of adding something that is ugly and distasteful. Our mode is one way of showing our politeness and our respect to our predecessors' work. But the question is whether in doing what we conceive to be the best, we are not unknowingly doing something disrespectful. We may be parodying our ancestors' work by adding to it, after all, a poor imitation, or in doing something or designing a feature which, under the circumstances, they would never have done—as, for instance, in copying a feature for which we have no use, in erecting a spire where they would have been satisfied with a tower or a simple lantern roof. How many modern restorers have removed Late Perpendicular roofs and substituted high-pitched ones, because they thought in so doing they were following more correctly the earlier design? Others have replaced Late flat-arched windows and doorways by sharp-pointed ones. All these and like alterations have been made, under the impression that the restorer was faithfully carrying out the intentions of the original builders, whereas, under like circumstances, they would have proceeded in a very different manner. Leaving the original design as it was, they would have acted on independent lines, taking down parts of the building that did not suit or were out of date, and rebuilding them according to their wants in the current style of the day. Our ideas of architecture have no doubt led us into these errors of judgment. We have been brought up in the belief that architecture is an exoteric art that must be learned from books and examples and applied to buildings when occasion requires, instead of looking at it as the current mode of working in materials—as nothing more, in fact, than artistic building itself. If we had come to look on it in this light, who shall say what our modern restorations had been? If we had a beautiful sculptured gable that had decayed and become dangerous to deal with, we should probably have taken down the whole of the decayed portion, two or three of the upper stages at least, and have rebuilt it in the current style of the day, regardless of the old detail. It would not have been done piecemeal, stone by stone, taking care to repeat exactly the old design, as we are now doing at Peterborough. Because we had only one kind of workmanship derived from tradition, we could not do otherwise. It would be the only honest mode. As it is, we now have two kinds of workmanship—the “ancient” and the “modern”—and whenever we touch an ancient building we adopt the former, because it appears to us more reverential. We even tool and dress the stones in the same way as the ancient masons did, observe the same thickness of joints and the same sizes of stone, so that really this duality of our methods has led us into the habit of restoring our ancient buildings according to one system, and adding to or altering our modern buildings on quite another plan. We

show great reverence to an ancient structure, though really it is not honest; while, in dealing with a new building, we proceed on quite different lines, and not always with common respect to its first architect.

The International Congress of Architects held at Brussels discussed this subject under three heads. They first considered whether it was right for an architect to repeat or correct mistakes of construction or errors of the ancients? We have generally dealt with our historic monuments on the first principle rather than the second. Whenever we have tried to improve or correct mistakes of construction we have committed errors, as when we have introduced modern roofs on old buildings. The question, however, suggests an important question in the restoration of buildings. When we are to let them alone and when alter? what we ought to preserve and what to improve? The two last questions which were put down for discussion were, Whether it is necessary to finish those portions of a work the old architects did not finish? and whether it is right to suppress those parts like construction or furniture for unity of style? The old builders often left portions of their buildings incomplete: towers were often only partially built, probably from want of means; sometimes because the foundations were not sufficient. The modern restorer is inclined to finish these parts, but has reluctantly given way to his better judgment. Many a modern builder would like to finish central towers and spires, to carve blocks which the old mason left for want of funds. Where the design is obvious, there can be no reason why the unfinished parts should remain as they are; and it is no disrespect to the old builder to carry out his intentions when they are sufficiently clear. Many of our large churches would have remained incomplete fragments if other generations had not carried out the original design. As to the remaining question of suppressing parts of construction for the sake of unity, it strikes at the very root of our modern restoration. The desire to preserve unity of style has been the main reason why so many buildings have been spoiled. We have already spoken of high-pitched roofs being put over old churches for the sake of preserving their original or early character. The same tendency is seen in adding a number of new windows and tracery and buttresses to correspond with the old, carving, bosses to match the ancient ones, repeating the same design of pillars and arches and so on. Half the copying of old work has been due to this reason—of seeking to preserve the harmony. The consequence has been that improved construction has been suppressed where it would have been of importance. We have seen an old timber roof slavishly copied, though it was faulty in construction, simply because it was preserving the original design. The desire for unity of character is very commendable, when it can be attained without the sacrifice of common-sense and good construction; but when we add to or restore old buildings it is better far that the new portion should boldly indicate a departure in our design and methods. Why should such anxious care and study be spent over such things as furniture and decoration to buildings erected several centuries ago? We have been far too fastidious in our tastes in these matters. The character of an edifice ought, of course, to be observed as far as we can. To place Louis XV. furniture or decorations into an old Gothic interior would be as absurd as to put Tudor or Stuart into a building of Greek design; but these nice distinctions have been carried too far in the past. As to interfering with buildings designed by contemporary architects, a point of delicacy comes in; but such a scruple does not arise when the architect has to deal with buildings some centuries old.

THE TRAINING OF ENGINEERS.

IN his valuable address before the Section of Mechanics at Toronto in connection with the meeting of the British Association, Mr. G. F. Deacon, M.Inst.C.E., dealing with the Education of Engineers, dwelt on one point of importance in the training of students that is in danger of being neglected. He asked: "Are we not in some cases attempting at too early a stage the teaching of subjects instead of principles? Complete subjects, I mean, including the practical working of details, which will become the regular study of the student in the office or works of an engineer. It certainly seems to me to be so. I do not say," continued Mr. Deacon, "that subject training of this kind at college may not be useful; but we have to consider whether it does not, for the sake of some little anticipation of his office work, divert the attention of the student from the better mastery of those principles which it is so essential for him to grasp at the earliest possible time, and which do not limit his choice in the battle of life to any branch whatever of the profession of an engineer, but which, on the contrary, qualify him better to pursue with success whatever branches his inclination or his opportunities may suggest."

Mr. Deacon thinks that there is some danger in the limitation of compulsory subjects in examinations for certificates and degrees. And he is right. Students are required to coach up in a few subjects to the neglect of others equally important, such as electricity and chemistry. We should like to know how many of our students in engineering are versed in either of these. Not a few of our engineers are quite ignorant of the principles of electricity and chemistry. Their early studies have been restricted perhaps to such subjects as mechanics or sanitary engineering, or workshop practice. The consequence is they enter the profession only half-equipped for its duties and responsibilities, and unable to turn their attention to any other branch of engineering which they may be called upon to advise upon. This restriction has been largely due, as Mr. Deacon observes, to the method of education pursued at our schools. Every professor has an interest in his own particular subject, and it is natural that he should try to limit the attention of every student who attends his lectures or his laboratories to his own particular study; it is his interest to make each of his students as proficient as he can, and to represent to them the great importance of his particular branch of engineering. He at least cannot be expected to encourage his pupils to pursue other and collateral studies that lie outside of his own subject. Thus it is that there are restricting agencies at work which limit the engineering student to one or two subjects, and so confine his attention to details which are better learned afterwards in the office or workshop. Such a course of study makes academical specialists, but not competent engineers able to grasp the laws of forces and materials with which they may be called upon to deal in the practice of their profession. The engineer should possess the principles of many subjects, and the practice of a few. We now find engineers either clever machinists or sanitarians, but unable to turn their attention to other branches like hydraulics, the construction of docks, harbours, and reservoirs, or to electrical engineering. Mr. Deacon therefore pleads for a moderate standard in all these subjects—that this standard should be made compulsory if a certificate of proficiency is to be given. Taking mathematics as taught at Cambridge and our public schools, it is suggested, and with much truth, that much that is claimed for it as a mode of mental culture might be profitably omitted from the engineer's curriculum. There are

parts of mathematics which have only an abstract value. The engineer's attention would be more usefully directed rather to those applications of the science which "give points and direct utility" to his solutions. He would, for example, find it more to his interest to study quadratic equations, than those higher theorems of mathematics which can only be appreciated as analytical exercises. The strength and elasticity of iron and steel for construction, as in bridge-building and roofs, boiler-plates, and the application of mathematics to the steam-engine, electrical engineering, and hydraulics are absolutely necessary applications.

We are quite sure these remarks will be appreciated by those who have the training of engineering students. When it is possible for the youthful engineer to be trained in the engineer's office or on the works, according to the old apprenticeship plan, he cannot do better than to devote his school or college course to the principles which underlie the many sciences with which he may be called upon to deal. It is better for him to lay a foundation of fundamental knowledge that can be applied to a wide field of practice than that he should acquire only a few special details in a school course. Mr. Deacon refers to the conditions of success amongst engineers, and he points to a conclusion which has been observed by men in other professions—namely, that the "most successful men in after-life are not produced exclusively from the ranks of those whose college course has been most successful." No one can dispute this fact, and it leads one to the inference that other conditions are quite as necessary as academical training. The power of marshalling facts, of presenting the principal points of a problem, is one of those mental faculties so valuable to the engineer and to the architect also. The power of formulating knowledge is, as Mr. Deacon says, one of the most valuable gifts; but even this faculty can be exercised and improved if proper means are employed to cultivate it.

THE A.A. "BROWN BOOK."

THE calendar, report of committee, timetable of classes, list of officers, and roll of members of the Architectural Association, familiarly known to all students by a title derived from its brown paper covers, has just been published, in readiness for the fifty-first session of the Association, to be inaugurated on Friday, October 8, by the presidential address from Mr. Hampden W. Pratt, F.R.I.B.A.

In their annual report the committee announce with satisfaction a marked increase in the number of members. 87 new members were elected during the session, 12 members were reinstated, and the losses by death, resignation, and other causes, amounted to 20, the total membership now being 1,190. (The roll showed, it may be mentioned, a total of 1,111 both in 1896 and 1895, 1,131 in 1894, 1,129 in 1893, 1,125 in 1892, 1,138 in 1891, 1,129 in 1890, 1,094 in 1889, 1,052 in 1888, 993 in 1887, 972 in 1886, 1,013 in 1885, 995 in 1884, 960 in 1883, 884 in 1882, and 863 in 1881, the present total being the highest yet reached in the history of the Association.) The committee has entered into a lease of the present premises at 53, Great Marlborough-street, W., terminable at certain short periods. During the spring of the present year well-attended visits have been made to the Tate National Gallery, Mr. Sidney R. J. Smith, architect; the L.C.C. working-class dwellings at Bethnal Green, designed by Mr. Thomas Blashill; Her Majesty's Theatre, Haymarket, the late Mr. C. J. Phipps, architect; the Building Trades Exhibition, at the Agricultural Hall; Royal Palace Hotel Extension, Kensington, Messrs. Legg and Son, architects; No. 27, High-street, Kensington, designed by Messrs. Banister Fletcher; and the Park Fever Hospital at Hither Green, Mr. Edwin T. Hall, architect. During the session papers were read by Messrs. Beresford Pite (president), G. Ewart, F. Walker, T. Stirling, jun., F. Inigo Thomas, H. H. Statham, W. H. Seth-Smith, E. Prioleau Warren, A. S. Flower, W. H. Bidlake, F. S. Granger, J. A.

Gotch, T. G. Jackson, R.A., H. Stannus, and S. S. Hellyer; the attendance at those meetings showed an increase on those of the previous session. The Jubilee of the Association was celebrated by a banquet, held at the Trocadero Restaurant, on May 5, and on the following day a conference on the work of the Association was held. The work of the classes and students has been very successful during the session, showing a continued improvement, especially in Division I. The handicraft classes have been considerably developed. For the first time in the history of the Association a class of students followed a coherent course of manual training in masonry and leadwork, and the attendance was well maintained throughout. The thanks of the Association are due to the London Technical Education Board, who made all the arrangements necessary for these classes. Several students availed themselves of the permission accorded by the Carpenters' Company and several Polytechnics for the admission of members to the Trades Training Schools and Workshop Classes. The annual balance-sheet appended to this report shows a much more satisfactory and healthy state of affairs than has been apparent for some years. The previous session, with a total outlay of £1,720 17s. 6d., closed with an excess of expenditure over income of £141 18s. 4d. This year, with a gross income of £1,684 13s. 11d., shows, for the first time since the introduction of the new educational scheme, that the Association has paid its way, there being an excess of income over expenditure of £37 15s. 1d. The principal sources of revenue were: members' subscriptions, £841 2s. 6d.; entrance fees, £178 10s., and students' fees £605 15s. 3d., each of these items showing a marked advance on last year. The chief items of expenditure were: £320 for rent, £192 6s. 8d. for salaries, £484 7s. 2d. for teachers' and instructors' fees, the last a reduction of nearly £100 on the previous year, balanced, however, by a new feature of the present year, "Grant to A.A. Notes, £100." The premises and general fund account, to which was transferred the credit balance of £37 15s. 1d. just referred to, and the annual grant of £100 from the R.I.B.A., now stands at £609 14s. 10d., against £515 8s. 6d. last year and £612 7s. 2d. at the close of the session of 1895. The entry of members' subscriptions received in advance is set down in the general balance-sheet at £11 0s. 6d., while subscriptions in arrear figure for £113, a reduction, and therefore an improvement, of £2 on last year's statement.

THE NEW LONDON WATER ACT.

"THE Act to amend the law respecting the Metropolitan Water Companies," which recently received the Royal assent, came into force on the 1st inst. By this Act, which is formed to give temporary relief to water consumers, and with a careful eye to the interests of the existing companies, the Railway and Canal Commissioners are constituted the proper authority for hearing any complaint which may be made by any water consumer or local authority against any of the eight Metropolitan water companies. The complaint may refer to the failure of the company "to perform some statutory duty," or "as to the quantity or quality of the water supplied for domestic use." The commissioners, if satisfied that the complaint is well founded, may, within a fixed period, order the defaulting company to remove the ground of complaint, and may impose any penalty upon them which can be imposed under any of the Metropolitan Water Acts, and may award damages to the complainant, and enforce their order in the same manner as they now enforce orders made against railway and canal companies. These powers are embodied in Clause 1 of the Act. Under Clause 2 the local authorities are given power to financially aid consumers in obtaining a judgment from the commissioners. The clause enacts that: "A local authority may aid any water consumer in obtaining the determination of any question which appears to be of interest to water consumers within the district of such local authority, with respect to the rights, duties, and liabilities of any of the Metropolitan water companies in reference to the quantity or quality of the water supplied, or the charges made by them. A local authority aiding any legal proceedings under this section may, if the Court thinks fit, be made a party to the proceedings, and shall be liable for costs accordingly." Under

PROPOSED CATHOLIC CHURCH DENHOLME, LUDDENDENFOOT, FOR REV. FATHER TILLMAN. W. WRIGLEY ARCHT. T.

Clause 3, the provisions of the Metropolis Water Act, 1852, and the Metropolis Water Act, 1871, are extended, so far as the eight Metropolitan water companies are concerned, to the whole area within their limits of supply, whether those limits are within the Metropolis or not. As regards the area outside the administrative county of London, the council of a county or the county borough is to be the authority mentioned in those Acts as "the Metropolitan authority." The remaining three clauses in the Act provide that the Railway Commissioners shall include in their annual report a return of all proceedings taken under this Act. It is also provided that the expression "water consumer" shall mean "any person who is supplied with water by any of the Metropolitan water companies, or who pays, or is liable to pay, any money charged by any of those companies for or in respect to the supply of water, whether under the name of rent, rate, or otherwise, and includes any householder, or owner or occupier of a house entitled to make a communication with the mains or pipes of any of those companies." The expression "local authority" is defined to mean "the council of any county, borough, or district, the mayor, aldermen, and commonalty of the City of London, and any vestry, district board, or local board of health in the county of London." The Act expressly provides that the powers contained in it "shall be in addition to and not in substitution for any existing proceedings or remedy," and that nothing in it "shall affect the terms of any agreement existing at the time of the passing of the Act between a water company and a water consumer as to the supply of water."

CHURCH AT LUDDENDENFOOT.

THIS church is now in course of erection at Denholme, Luddendenfoot, Yorks, and provides accommodation for 400 persons. The site is a very steep one, allowing for a large assembly-hall under the whole of the church, the interior

of which will be left incomplete at present. The walls are of pitched-faced wallstones, with local stone dressing. The cost of the building will be about £1,650, exclusive of furnishing and heating. Mr. W. Wrigley, M.S.A., of Hebden Bridge, is the architect for the work.

THE SANITARY CONGRESS AT LEEDS.

THE sixteenth annual congress of the Sanitary Institute is to be held at Leeds next week, opening on Tuesday and closing on Saturday evening. A large local committee has been formed, of which the Lord Mayor of Leeds (Sir James Kitson, M.P.) is the chairman, and the Town Hall, the Yorkshire College, and other buildings have been placed at the disposal of the congress for meetings. A number of delegates, representing the War Office, county and town councils, urban and rural district councils, port sanitary authorities, school boards, universities, societies, and medical bodies, have been selected to attend.

The President of the Congress is Dr. Robert Farquharson, M.P., who will deliver his inaugural address in the library of the Yorkshire College at three o'clock next Tuesday, his subject being "Some Defects of Modern Civilisation, with Hints for the Improvement of the Human Race." An exhibition of sanitary appliances will be opened in the Camp-road-buildings in the evening of the same day. The second day will be occupied with a series of conferences, six in number. In every case the president will deliver an address, and papers will follow. The conference on river pollution will be presided over by Major Lamorock Flower, sanitary engineer to the Lea Conservancy Board. Amongst his recommendations will be found one in favour of the creation of a central inspector of sources of water supply. Papers on the general question and on the purification of trade effluents are also to be read. The conference of municipal representatives will be presided over by Mr. Councillor B. Womersley, chairman of the Leeds

Sanitary Committee, whose address will be local and historical. Papers are promised dealing with the subjects of the Church and Sanitation, Working Class Dwellings in Belfast, the Influence of Large Towns on the Sanitary Progress of Neighbouring Small Towns, and other matters. Medical officers of health also meet in conference under Dr. Edward Seaton, and there the papers will deal with Small Isolation Hospitals, Poisoning by Tinned Foods and its Prevention, &c. Dr. Sykes (St. Pancras) will contribute a paper on Artisans' Dwellings as affected by Customs and Inland Revenue Acts; and the Assistant Professor of Public Health at University College, Mr. H. Kenwood, M.B., will detail some experiments showing that formic aldehyde vapours effectually disinfect rooms quickly and without affecting the colours and textures of fabrics. Mr. Thomas Hewson, the city engineer and surveyor of Leeds, will preside over the conference of municipal and county engineers. Subjects for discussion comprise the Disadvantages and Dangers of Combined Drainage, Sanitary Aspects of Wood Pavement, Storm Water Drainage, &c. The sanitary inspectors will meet under Mr. Peter Fyfe, chief sanitary inspector of Glasgow, at the School Board offices. The ladies' conference on domestic hygiene, under Mrs. Fawkes, will meet in the Methodist New Connexion Hall. The subjects already fixed include Health in Infant Schools, Women as Hygiene Teachers, and the Milk Supply and its Dangers. The day's work will be followed by a conversation and reception by the Lord Mayor in the Art Gallery in the evening.

The three sections will begin their work on the Thursday and continue it on the Friday. Mr. T. Pridgin Theale will preside over and address the section on Sanitary Science and Preventive Medicine. The subjects for papers include Infant Mortality, Hygiene in Elementary Schools, and Sewage in Estuaries. The last-named paper will be by Dr. Francis T. Bond. Section II. deals with engineering and architecture. Its proceedings will be opened with an address from its

president, Mr. Lewis Angell. The topics of the papers will include Sewage Filtration, Disposal, and Purification, Fever Hospitals, Baths and Washhouses. Section III.—Chemistry, Meteorology, and Geology—has for its president, Mr. W. Whitaker, who is to offer suggestions about Federation for Water Supply. On Thursday the lecture to the congress in the Albert Hall will be given by Mr. H. Percy Boulnois, city engineer of Liverpool, on Some Sanitary Advances in Municipal Engineering. The congress will conclude with a lecture by Mr. Philip Boobyer, medical officer of health, Nottingham, on the Essentials of Popular Hygiene. The Sanitary Exhibition will remain open until October 9.

PLASTERS, CEMENTS, AND MORTARS FOR BUILDERS' USE.

WATERGLASS.

THIS is chemically known as silicate of soda and silicate of potash. It is a very useful medium for preparing plasters of special kinds. Thin waterglass and chalk form a cement or mortar that hardens completely in six to eight hours; whilst if metallic salts be incorporated with the mass, a variety of cements are produced which are suited to special purposes. For example, if zinc filings, chalk (in the dry powder state), and waterglass be mixed into a suitable paste, a mass is produced which will cement metallic zinc to various substances; if sulphide of antimony be used in place of the zinc filings, a dark mass is produced which takes a very high polish; whilst if iron filings be used, a greyish-black mass is produced.

AN HYDRAULIC MORTAR OR CEMENT

is made by quickly mixing finely-ground Portland cement with a solution of waterglass. This compound dries very quickly, and hardens under water. Before applying the cement, coat the stones with a solution of waterglass.

A FIREPROOF CEMENT

can be made by mixing together, as quickly as possible, 1 part of glass powder, 2 parts of fluor-spar powdered, 6 parts of waterglass. In three or four days after use, this cement will stand fire-heat. With lime salts, waterglass slowly hardens. Thus a soft mortar in which to stamp or press sharp-edged stones may be made by mixing 1 part of quicklime and 10 parts of whitening (elutriated chalk) into a paste with $2\frac{1}{2}$ parts of waterglass. Moulds should be used for forming the mass. By using quicklime alone with the waterglass, a very hard and quickly-drying mass is obtained, very useful in filling up cracks, &c., in stone, plaster, or brickwork.

For cementing pipes exposed to heat, a mixture made of 1 part zinc white (zinc oxide), 8 parts of pyrolusite (manganese black oxide), 2 parts of waterglass. This compound will stand a red heat, and when once it is fused it will form a glass-like mass, very tenacious.

For cementing slabs of marble together, a mixture made of 4 parts of whitening and 1 part of thick solution of waterglass forms a hard mass in a few hours that can be polished.

A SOLUTION FOR COATING STONE WALLS

and rough-cast or plastered ditto. can be made by mixing 1 part of waterglass with 3 parts of soft water (i.e., free from lime); it will cause a coating to form on the surface which is hard and weather-proof. The carbonate of lime in the mortar is converted into a silicate of lime by the decomposition of the waterglass, whereby the surface becomes coated as if with glass. A solution of waterglass brushed over whitewashed walls will prevent the whitewash being rubbed off, and enables the wall to be washed.

A white, enamel-like paint is produced by grinding up 4 parts of zinc white, 2 parts of permanent white (sulphate of barium), in water-glass.

As a special waterproofing and rust-preventer on metals, a solution of waterglass with manganese is very useful, particularly so as, if the metal be submitted to heat, an enamel-like surface is produced. Several applications of water-glass solution will render its surface very hard and smooth and weather-proof, while by dissolving powdered chalk in water-glass, a paste is made which can be used either as a wash for the surface of stone, but also for repairing chipped places, cracks, and by diluting 1 part of water-glass of 33 per cent. with 5 parts of rain or soft water a fire-protective coating is

formed when such solution is applied to wood, allowing each coat to dry before putting on the next.

Ceiling plaster is variable in its composition, but a good, sound-proof, non-cracking plaster is made by mixing together 35 parts of sawdust, 35 parts of sand, 10 part of plaster of Paris, 10 parts of glue (softened in water), 10 parts of whitening. A plaster from clay is made by stirring gradually 1 part of rye-flour into 26 parts of water, and boiling the mixture until it is reduced a trifle in bulk, then take 1 part of this mixture, 8 parts of dry clay, and water sufficient to make the compound of a workable consistence.

Damp walls should be plastered as follows:—Give two coats of ordinary mortar to the walls, and smooth the last coat with a steel float, then give a third coat of very fat lime, and finally glaze this with pure lime compounded with $\frac{1}{20}$ th part of alum, and some alumina (clay).

HARD WEATHERPROOF PLASTER.

No. 1.—Mix into a paste with water-glass, 12 parts of Portland cement, 6 parts of chalk (made into a paste with water), 6 parts of fine sand, 1 part of silicious earth (kieselguhr or "fossil" meal).

No. 2.—Prepare as above, 6 parts of Portland cement, 12 parts of chalk paste, 6 parts of fine sand, 1 part of fossil meal.

No. 3.—This is the hardest of the three grades. 9 parts of Portland cement, 6 parts of chalk paste, 6 parts of fine sand, 1 part of fossil meal.

A WHITE HYDRAULIC CEMENT

is prepared by mixing with lumps of brick the following ingredients, which, after being dried and burned at a white heat, are ground and used in cement or mortar; 10 parts of fossil meal (also called infusorial earth or kieselguhr) free from iron, 30 parts of chalk also free from iron, 1 part of silicate of soda or of potash.

TO MAKE CEMENT-WORK WEATHERPROOF.

Dissolve 1 part of sulphate of iron (green copperas) in 3 parts of water, and well soak the cement work with this solution for 24 hours, and then dry it in the air; oxide of iron will be produced in the cement, when it will become a browner colour, and the oxide that is found will enable the cement to be more resisting to weather influences. As a still further protection against the weather, dissolve equal parts of paraffin wax and paraffin oil and brush this over the cement work, after having previously warmed the cement by holding a brazier of live coals in front of it. If, instead of the wax solution, two applications of a 5 per cent. solution of soap in water be brushed over the cemented work, and the latter then dried, it can be polished and painted with oil paints. The soap, when it comes in contact with the oxide of iron in the cement, will become converted to ferrum sebate, which is insoluble in water, and will fill the pores of the cement and so save the paint being absorbed. If alum be added to the green copperas solution the cement becomes of a pale yellow-ochre tint, while if chrome alum be added to the copperas solution, the cement work will become green. Chalk surfaces, after treating in this manner, can be washed.

FIREPROOF PLASTER FOR CEILING.

Make into a paste slaked lime, bullock's blood, burnt alum, cement, sand, and brickdust, or else pumice-stone, coal-ashes, sawdust, broken glass or porcelain, and water-glass. The proportions may vary. Lay this mass on as a first layer, and then as a top layer above it lay on a mass composed of linseed-oil in which asphaltum and litharge has been heated. Mix them into a mass of broken glass, burnt alum, blood, cement, plaster of Paris or chalk, and pumice-stone. It is not necessary to use all these solid bodies; a selected few may be made. If the above compounds are desired as fireproof roofs, both masses should be laid on in a cold and liquid state on a solid and firm base, or else on wire net which has been coated with water-glass, and then spread on it the top layer or compound.

Sawdust in plaster is a good non-conductor of sound, and also as a substitute for sand in some cases. Thus, one formula for such plaster is to mix equal parts of sawdust and plaster of Paris, while another formula directs the mixture to be made thus: 56 parts of slaked lime and sawdust, 16 parts of plaster of Paris, 4 parts of softened glue (or boiled glue in liquid state), 1 part of glycerine. Mix altogether, and use like plaster.

Columns and pillars which are not intended to

sustain any weight, but only for ornament, may be made thus:—Mix 1 to 3 parts (according to the degree of porosity desired) of resinous sawdust with 1 part of china clay (dry), and add sufficient water to form a plastic mass of a spongy consistency, and submit this mass to strong pressure in steel cylinders, so as to produce columns 8 in. to 12 in. diameter, and 4 ft. or 6 ft. long. Dry the blocks in the open air, then in a drying oven, and finally submit them to a white heat in a furnace. When cooled, these columns can be cut, sawed, planed, or worked like terracotta. It is fireproof, and only about half the density of ordinary bricks.

TURKISH PLASTER FOR COVERING PIPES.

Ingredients: 150 lb. fresh lime reduced to powder, 15 quarts of linseed oil, $1\frac{1}{2}$ oz. of cotton waste. Preparation: Put the lime into a wooden trough, and then gradually mix in the linseed oil and cotton waste until the whole is of the consistency of bread-dough; then dry the mixture, and, for use, mix it with linseed oil to reduce it to a consistency that will allow it to be laid on in coats.

WATERPROOF CEMENTS.

No. 1.—For Cementing Glasswork. Ingredients: 6 parts of whitening, 3 parts of plaster of Paris, 3 parts of white sea-sand (shingle), 3 parts litharge, 1 part of rosin powdered, coach-varnish q.s. Preparation: Mix all the solids together in the dry state by sifting them several times, and then make the mixture into a putty with sufficient coach-varnish. A week's exposure to the air is required before the cement is thoroughly proof against water.

No. 2.—For cementing stone, metal, glass, or wood tanks for fresh or salt water. Ingredients: (All parts by measure, not weighed.) 10 parts of litharge, 10 parts of plaster of Paris, 10 parts dry white sand, 1 part of rosin (powdered), boiled linseed oil q.s. Preparation: Mix the solids dry, and when wanted for use make a putty of the compound by mixing it with sufficient boiled oil. Give three days' exposure to the air before allowing it to come in contact with water.

CEMENT FOR BUILDING CONSTRUCTION.

Ingredients: 1 heaped bushel of mortar (made in the ordinary way) $3\frac{1}{2}$ quarts (dry measure) of iron scale, $1\frac{1}{2}$ quart of treacle. Mix all together, and use the same day.

CONCRETE.

No. 1.—For foundations. Ingredients: 5 parts of gravel and sand, 1 part fresh-burned stone lime powdered by grinding (both components measured dry). Well mix these together with the shovel, and add sufficient water while doing so to slake the lime into the state of very thick mortar. Chips and bits of stone may be added if considered desirable.

No. 2.—For masonry. Ingredients (by measure): 9 parts of screened sand, 7 parts of slaked lime, 1 part of forge-ashes, 1 part of pozzuolana. Mix as in mortar-making.

No. 3.—For brickwork. Ingredients, by measure: 7 parts of slaked lime, 12 parts of sand. Mix as mortar.

Mason's cement for joining stone pavements. Ingredients: 20 lb. clean river sand, 2 lb. litharge, 1 lb. quicklime, linseed oil q.s. to make a thin paste. Mill-grind up all together in a mortar-mill.

CEMENT FOR PIPES.

No. 1.—For joining large pipes. Ingredients: (parts by measure) 12 parts of Roman cement, 4 parts of white lead (dry), 1 part of litharge, $\frac{1}{2}$ part rosin powdered, old linseed oil, boiled with rosin (1 oz. per gallon) q.s. Preparation: Mix all the solid ingredients together, and then mix $2\frac{1}{2}$ lb. to 3 lb. of this mixture with sufficient of the linseed oil to form a suitable putty or mortar.

No. 2.—Ingredients: Equal parts, dry measure, of burnt lime, Roman cement, potter's clay, ordinary clay, linseed-oil q.s. Preparation: Dry each ingredient, and then grind them separately, and mix by sifting, and finally mix up the compound with sufficient linseed-oil.

No. 3.—Ingredients (by measure): 2 parts of red lead, 5 parts of white lead, 3 parts of clay that has been mixed in water, allowed to settle, collected, and dried, boiled linseed-oil q.s. Mix all the solids together by sifting them, and then make into a putty with sufficient of the oil.

No. 4.—For water-pipes, and to resist fierce heat. Ingredients, by weight: 5 parts of zinc white, 4 parts of pyrolusite (mixed dry), 1 pint sodic silicate.

No. 5.—For covering steam or gas-pipes, as it is impenetrable by air or steam. Ingredients: 6 parts of powdered graphite, 3 parts of slaked lime, 8 parts of sulphate of lime, 7 parts of boiled oil. Knead all well together.

No. 6.—Ordinary cement for stone pipes. Ingredients (dry measure): 1 part of good Portland cement, 3 parts of sharp sand or gravel, water q.s. Mix the ingredients in the dry state, and then make into a mortar with sufficient water, and use as fast as it is made.

PLASTER OF PARIS CEMENTS.

No. 1.—Ingredients: Plaster of Paris, saturated solution of alum. Preparation: Bake the plaster of Paris, and then grind it; next steep it in the alum solution for 24 hours, and afterwards dry it, and then bake it a second time, and grind up for use. Mix with water when wanted.

No. 2.—Make a solution of 20 parts of water, 1 part of borate of manganese, 1 part of cream of tartar. Bake the plaster of Paris in an oven until it is hard, and then steep it in the above fluid until it is saturated; bake it again until dry and hard, and then grind to a powder for use by mixing it with water, and using it at once.

CEMENT FOR POINTING BRICKWORK.

Six equal parts of Portland cement, lime, and white sand; water q.s.

CEMENT OR PLASTER FOR FACING BUILDINGS.

Ingredients (dry measure): Mix together 1 part powdered quicklime, 2 parts of baked clay, powdered; mix together 1 part freshly-baked plaster of Paris, powdered, and 2 parts of baked clay. Make the two mixtures, and then mix them together to form one compound. Make into a putty or mortar with sufficient water, and apply like mortar. It becomes very hard and durable.

PLASTER OF PARIS ARTICLES OR WORK

may be made hard enough to enable nails to be driven into it by treating it with a solution of glue or gelatine until it is thoroughly saturated.

SUBSTITUTE FOR PLASTER OF PARIS.

Ingredients (by weight): 2 parts of best whiting, 1 part of glue, 1 part of linseed oil, raw. Preparation: Heat all these materials together (having first soaked the glue in water until soft, but not lost its shape); mix thoroughly, and when cool, lay it on a stone which is covered with powdered whiting, and heat until the mass is bright, tough, and firm, or else press into moulds; it becomes very hard in time.

Plaster for Inside Buildings.—Fine stuff: Slake lump lime with water to a paste, and then add more water until it is of a creamy consistency, and allow it to harden by the evaporation of the water. It is then used for slip coat, but is ready for finishing coat when prepared with plaster of Paris or sand. Coarse stuff: 2 parts of lime paste, $\frac{4}{5}$ parts of sand, $\frac{1}{5}$ part of cowhair. Gauge stuff, or hard finish: $\frac{1}{2}$ to 2 parts of "fine stuff" and $\frac{1}{2}$ part of plaster of Paris.

For cornices: Use equal parts of "fine stuff" and plaster of Paris.

PORTLAND CEMENT

Is manufactured from chalk or some other salt of lime (chalk is calcic carbonate or carbonate of lime), river-mud, or clay and oxide of iron, the proportions of each varying according to the formula of each maker of the cement, the proportion of limestone varying from 65 per cent. to 80 per cent., and of clay and iron oxide 20 per cent. to 35 per cent. These ingredients are intimately mixed with water in a mill, then slowly dried on hot plates, and afterwards calcined in a kiln and reduced to fine powder. By keeping this compound as thus prepared several months before use, its adhesive and cohesive strength is increased. By mixing this compound with water to a paste, it hardens rapidly; the addition of sand decreases the rate at which it hardens. To use this cement as "stucco," 3 to 4 parts of sand should be mixed with it to 1 part of the cement. The sand must be sharp clean sand, free from loam (that is, it should be pure sand, not sand and lime, or clay), otherwise it will not harden, but crumble to pieces in the wall; for this reason, washed river-sand is generally used. If stucco is to be painted, some months should be allowed to elapse before applying the paint; otherwise the paint will peel off, and form blisters. This is probably due to the quantity of the quicklime in the cement not being thoroughly slaked before becoming hardened.

POZZUOLANA CEMENT.

This cement takes its name from an earth of volcanic origin; it is rough, dusty, and granular in texture. When mixed with one-third its weight of lime and water, it hardens very suddenly, and is the best and most durable cement to harden under water; but as the pozzuolana is obtained from but few places in Italy, it is not commercially cheap enough to be used for general purposes.

MANGANESE OXIDE

(De Blout oxide or pyrolusite) is a valuable ingredient in cement, and are mixed with water. This is a most excellent formula for sand or cement:—4 parts of grey clay, 6 parts black oxide of manganese, 90 parts (about) of good limestone reduced to powder and calcined to expel the carbonic dioxide. Mix all the ingredients, calcine the mixture, and when cooled work it into a stiff paste with sufficient water to 60 parts of clean (washed) sand.

MARBLE CEMENT.

No. 1.—Ingredients (by weight): 8 parts of rosin, powdered, 1 part of wax, 4 to 5 parts of plaster of Paris. Melt the wax, then dissolve the rosin in the hot wax, and next stir in the plaster of Paris. Use the compound while hot, and make the pieces of marble hot where they are to be joined.

No. 2.—Ingredients (by measure): 12 parts of Portland cement, 6 parts of slaked lime, 6 parts of fine sand, 1 part of infusorial earth (fossil meal), silicate of soda q.s. Mix all the solids in the dry state, and then make into a thick paste with the soda silicate. Use the cement cold, and the marble also should be cold. After cementing, leave the joined pieces 24 hours undisturbed.

No. 3.—Ingredients: 100 parts of chloride of zinc solution (specific gravity, 1.490 to 1.652), 3 parts borax (powdered), or salammionic dioxide of zinc q.s. Preparation: Mix 3 per cent. of borax with the solution of chloride of zinc, and then work in sufficient zinc oxide to make a stiff paste. This cement becomes as hard as marble, can be polished, and even be used for moulding.

ROMAN CEMENT

is similar to pozzuolana cement, but sometimes bullock's blood is used instead of water to mix up the ingredients.

ROOFS: CEMENT FOR ZINC OR LEAD.

Ingredients (by weight): two pints common pitch, one pint guttapercha. Melt the ingredients together in an iron pot, and then pour it on hot on the parts to be cemented, and smooth the cement with a plumber's soldering iron, having previously run the hot iron over the parts of the metal where the cement is to be used.

BRICKLAYERS' CEMENT FOR POINTING.

No. 1.—50 parts slaked lime, 40 parts bullock's blood, 1 part alum.

No. 2.—50 parts slaked lime, 25 parts fine ashes, 8 parts to 10 parts of bullock's blood.

SIDEWALKS, CEMENT FOR PREPARING ARTIFICIAL.

Remove the earth to a depth of 18in., and then fill up to a depth of 12in. with large stones, and on top of these lay a bed of concrete 4in. thick, made of one part Portland cement and six parts of stone chip and gravel, and on top of this lay 2in. of a cement made of one part Portland cement and two parts of fine sharp sand. Lay this on up to the surface of the ground, and float the surface of the cement as considered necessary. To give a finish, line off into regular blocks.

CEMENT TO MEND SANDSTONE.

Ingredients: 10 parts of clean sand, 1 part of lead oxide (litharge), $\frac{1}{2}$ part of ground lime, linseed oil q.s. Make into a cement with the oil to a thick paste.

To cement iron in stone, mix plaster of Paris with water, and to the mixture add 1 part of iron filings to 6 of plaster (by weight).

To fasten copper to sandstone. Ingredients (by weight): 7 parts of white lead, 6 parts of litharge, 6 parts of bole, 4 parts of broken glass, 4 parts of linseed-oil varnish. Mix up together to form a putty.

ENGLISH ROMAN CEMENT.

Ingredients: 1 bushel of slaked lime, $3\frac{1}{2}$ lb. of green copperas, $\frac{1}{2}$ bushel of fine gravel sand, 15 gallons of water. Dissolve the copperas in hot water; stir it continually while in use. Mix as much as is required for the entire front of wall

to be dealt with, as it is not always easy to match the exact colour again.

CEMENT FOR FLOORS OF CELLARS, BASEMENT, KITCHEN, ETC.

No. 1.—Five parts of clean, coarse, sharp sand (what plasterers call fine gravel), 1 part of cement (Portland or hydraulic). Just dampen sufficient to make it work well. Mix it in a box, and then tip it into the cellar, and spread smooth with a trowel, hoe, or trowel about 2in. thick, and then level it down hard and smooth with the flat side of a shovel.

For finishing, use 1 part of cement to one part of sand. Mix them thoroughly, and then water it like plastering mortar. Dump it on the first coat about $\frac{1}{2}$ in. thick; spread and smooth with a trowel. It will soon become as hard as stone.

No. 2.—For floors of rooms, &c. 6 parts of plaster of Paris, 1 part of lime. Mix together, wet, slake, and lay on the floor. When dry, lay on a solution of green copperas in water. Repeat this several times, allowing the surface to be perfectly dry before giving the next application. After several days' rest and drying, give it a soaking with boiled linseed-oil, and finally a coat of copal varnish. As the cement expands, perform the laying of the cement in sections. The colour will be a brown.

CEMENT FOR FIXING ROOFING TILES.

Ingredients: 4 parts of dry sand, 4 parts of whiting, 1 part of litharge, linseed oil q.s. Make into the consistency of putty. It will not crack when cold, nor be melted by the heat of the sun like tar or asphalt.

FIREPROOF CEMENTS.

No. 1.—140 parts of iron filings, 30 parts of hydraulic lime, 25 parts of quartz sand, 3 parts of salammionic, vinegar sufficient to make into a paste. Let the cement slowly dry before heating it.

No. 2.—180 parts of iron filings, 45 parts of lime, 8 parts of common salt, vinegar to make a paste. Let the cement be perfectly dry before being heated, when it becomes stone hard.

No. 3.—Linseed meal or almond meal, milk, lime-water, or starch-paste. Make into a paste, which resists a temperature of 500° F. (260° C.)

No. 4.—Clay, sand, water. Puddle the clay in the water, and then mix in as much sand (previously sifted) as possible with the hands, and then lay it on the object to be fireproofed in coats more or less thick.

No. 5.—5 parts of dry clay, 1 part of iron filings, linseed oil sufficient to mix to a paste.

No. 6.—10 parts of common clay dried and pulverised, 4 parts of iron filings, 1 part of common salt, 1 part of borax, 2 parts of manganese peroxide. Mix with water.

WATERPROOF CEMENT FOR GUTTERS, TANKS, ETC.

No. 1.—1 part of tar, 1 part of tallow, 1 part of fine brickdust. Warm the tar and then add the tallow, and throw in the brickdust, apply hot after thoroughly mixing.

No. 2.—3 parts of manganese iron ore, 17 parts of lime calcined and mix with a little sand powdered, and when thrown into water the compound hardens rapidly.

No. 3.—4 parts of fine clean sand, 2 parts of quicklime powdered, 1 part of bone-ash, water q.s.

COMMON MORTAR

is composed of quicklime and sand, reduced to a paste with water. The lime should be pure and completely free from carbonic acid, the sand should be free from clay, partly in the state of fine sand and partly in the state of gravel. The water should be pure, and if previously saturated with lime so much the better. The best proportions are: 3 parts of fine sand, 4 parts of coarse sand, 1 part of quicklime recently slaked, and as little water as possible. The addition of burnt bones improves the tenacity of the mortar, and prevents the tendency to crack in drying. They should not exceed 25 per cent. of the lime employed.

The addition of garden-mould, cinder-ashes, and rubbish to this for the foundation of buildings spoils the mortar; moreover, the addition of dustbin ashes is positively injurious to the health of whoever inhabits the house built with such mortar or plaster, because the lime in the mortar, together with moisture, will breed a multiplicity of germs from the dust-bin refuse which will produce many infectious diseases. Anyone who detects this foul smell the offensive emanation given off from the plaster of a shoddy or "jerry-

ARCHITECT APPOINTED FOR ERECTION
HENRY MARTIN

built" house. The odour is most disgusting, and if inhaled for any length of time will produce serious throat diseases. The sand should be hard, sharp, gritty, and not too fine; it should be free from all organic matter. Good sand suited for mortar only can be rubbed between the hands without soiling them. The water should also be free from organic matter, and on this account should not be taken from stagnant ponds. The presence of salt in mortar causes an efflorescence of white frothy blotches on the surfaces of the bricks, and renders the mortar liable to white moisture. To get rid of these white patches, wash the surface with hydrochloric acid and water. The sand in mortar is to increase the resistance of the mortar to crushing and lessen the amount of shrinking, and to reduce the bulk of the more costly material, lime. Water is the agent effecting a combination between the materials, and as sand does not increase in volume, it necessarily follows that no more of the diluting element should be employed than is absolutely necessary to fill the interstices between the sand, and render the whole into a paste convenient for use.

Hydraulic mortar can be made by mixing $\frac{1}{2}$ to $\frac{3}{4}$ part of alum shale to the lime. The compound dries very hard and impermeable. H. C. S.

BIRMINGHAM PUBLIC BATHS.

EVER to the front in municipal progress, the city of Birmingham ranks among the earlier towns in which public baths on an adequate scale were provided out of the public purse. The account of their stewardship for the use of other governing authorities has now been issued by the Baths and Parks Department of the City Corporation, giving a comprehensive history of the Birmingham City Baths, their acquisition, cost, and annual maintenance. This most useful and

carefully prepared book contains plans of these establishments, together with a variety of information as to the number of bathers, a summary of expenditure, and other statistics. For the information of district councils and other bodies interested in the erection of baths and wash-houses for the material health and wellbeing of the communities in which they may be concerned, we may say that extra copies of the work under notice can be had of Mr. J. Cox, M.I.M.E., engineer to the City of Birmingham, for three shillings and ninepence post free. Inquiries from all parts for particulars of this kind are constantly being made, and applications come from America and South Africa, as well as our English towns, while Continental cities also frequently, seek information of this character. It is impossible for us, even in an abstract, to epitomise the tables and details to be found in this Birmingham record of useful municipal development in this one subject of baths. As early as 1794, in Liverpool, there was a large bath, then a private enterprise; but subsequently it was purchased by the town, and continued in use as a public bath till 1820. In 1828, the first specially erected public bath was built in Liverpool at a cost of £43,600. In 1842 the first public laundry was erected in Liverpool. Birmingham can, however, it seems, claim priority in this matter, for as far back as the year 1731 baths of some importance, described "as the most complete baths in the whole island," were in use as a private undertaking. In 1844 the baths and washhouses movement began to establish itself, and various Acts of Parliament rendered its development possible. The Kent-street Baths, Birmingham, from the plans of Mr. D. R. Hill, architect, were erected in 1851; but previous to the passing of Sir George Grey's Bill in 1846, voluntary effort had made itself felt in Birmingham when the Public Baths Association held lectures

and public meetings, with the result, among others, that the site in Kent-street was purchased and ultimately sold to the Corporation in 1848, and the buildings were erected, as already stated, by the town, at a cost of £23,000. The Woodcock-street Baths, from the plans of Mr. Edward Holmes, were erected in 1860, and, as originally designed, were intended to provide two large swimming-baths, but only one was built at that time. Its cost, with subsequent alterations, was £12,378 10s. 6d. The Northwood-street baths, by Mr. William Martin, in 1862, has two large swimming-baths; the cost was £12,283. The next establishment erected was that in Monument-road, in 1881, the architects being Messrs. Martin and Chamberlain. Of their work we reproduce the two chief plans, which approach more nearly the more recent development of the planning of such buildings, and show in many ways a most convenient scheme well carried out, including a Turkish bath. The total cost was £27,339 6s. 8d. The inhabitants of Bordesley and that district are to be furnished with a bath in Green-lane, Small Heath, from Mr. H. Martin's plans, the engineer being Mr. J. Cox. We give the ground floor of this proposed establishment, which comprises two swimming-baths, each having a water area of 81ft. by 33ft. The various departments are conveniently grouped round one ticket-office, behind which is a private connecting corridor for the use of the staff. The women's entrance is in the centre of the façade. £21,000 is the estimated cost. It is likewise proposed to erect public baths at Balsall Heath. There are open-air swimming-baths at Cannon Hill Park and Victoria Park, concerning both of which various particulars are given in this volume. A general plan of the city adds value to the book, giving, as it does, the localities in which the several baths, parks, and recreation grounds under the control of the Baths and Parks

BIRMINGHAM.

Committee are situated. The Baths and Washhouse Acts of Parliament are reprinted, with the by-laws framed and adopted by the City Council. It will thus be seen how thoroughly well this useful report has been made. Intelligence and cleanliness generally are intimately associated, and Birmingham institutions have gone far to prove the rule. Certainly the city sets in this respect a good example worth following.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—II.

By AN ASSOC. INST. ELECT. ENGS.

WORKED EXAMPLES.—(1) What is the length of a wire of which the resistance is 9 ohms, given that a wire of the same material and cross-section, and 20ft. in length, has a resistance of 30 ohms? Since $R = \frac{\sigma \cdot l}{A}$ (see Eq. 3), and σ and A are the same in the two wires,

$$R : R_1 = l : l_1 \text{ or } 30 \text{ ohms} : 9 \text{ ohms} :: 20 \text{ ft.} : l_1 \text{ ft.}$$

$$\therefore l_1 = \frac{9 \times 20}{30} = 6 \text{ ft.}$$

(2) Find the resistance of a wire 200c.m. long and .05mm. diameter, given that $\sigma = 1.642$ microhms :—

$$\text{Resistance} = R = \frac{\sigma \cdot l}{A},$$

$$\text{and—} A = \frac{\pi}{4} d^2 = .7854 \times (.005)^2 \text{ sq. centimetres.}$$

$$\therefore R = \frac{1.642 \times 200}{.7854 \times .000025} \text{ microhms} \\ = 16725235.5 \text{ microhms} = 16.725 \text{ ohms.}$$

(3) What is the diameter of a wire one mile long which has a resistance of 20.25 ohms, if a mile of the same wire, 45 mils in diameter, has a resistance of 25 ohms? (NOTE.—1 mil = $\frac{1}{1000}$ in., or 0.001 in.)

Since the length and resistivity of the two wires are the same, it is obvious that the areas of cross-sections of the wires are inversely as the resistances. That is:—20.25 ohms : 25 ohms :: area of second wire : area of first wire. And if d = diameter of wire required—

$$\therefore 20.25 \text{ ohms} : 25 \text{ ohms} :: (45)^2 \times \frac{\pi}{4} : d^2 \times \frac{\pi}{4}$$

$$\text{and—} d^2 = \frac{25 \times 45 \times 45}{20.25}$$

$$\therefore d = \sqrt{\frac{25 \times 45 \times 45}{20.25}} = \frac{5 \times 45}{4.5} = 50 \text{ mils.}$$

(4) The conductance of a wire 30ft. long is 4.5mhos.; what is the length of a wire of the same material and cross-section, the conductance of which is 3mhos.? The resistance of a wire is directly proportional to its length; therefore the conductance of a wire is inversely proportional to the length.

$\therefore$ Conductance of second wire : conductance of first wire :: length of first wire : length of second wire; and 3mhos. : 4.5mhos. :: 30ft. : l ft.

$$\therefore l = \frac{30 \times 4.5}{3} = 45 \text{ ft.}$$

(5) Determine the resistance of 250 yards of wire 25 mils in diameter, the resistance of 1 mile of that wire 8 mils in diameter being .09 ohm.

Let R = resistance required, and σ = resistivity of wire; then—

$$R = \frac{\sigma \times 250}{\frac{\pi}{4} \times (25)^2} \dots\dots\dots (x)$$

$$\text{but—} .09 = \frac{\sigma \times 1,760}{\frac{\pi}{4} \times (8)^2} \dots\dots\dots (y)$$

And dividing (x) by (y), we get—

$$\frac{R}{.09} = \frac{250 \sigma}{\frac{\pi}{4} \times 25 \times 25} \div \frac{1,760 \sigma}{\frac{\pi}{4} \times 8 \times 8}$$

$$= \frac{250}{1,760} \times \frac{64}{25 \times 25} = \frac{4}{275}$$

$$\therefore R = \frac{4}{275} \times .09 = 0.001309 \text{ ohm.}$$

This method of forming ratios is recommended for all cases of complicated calculations.

6. The resistance of three conductors of the same lengths are respectively 2, 4, and 5 ohms. What will be the resistance of a conductor formed by placing the three wires side by side so that

the new conductor has a larger area of cross-section, but the same length?

This problem is much simplified by dealing with the conductance instead of the resistance. It is obvious that the conductance increases proportionately with the number of wires placed side by side, and is the sum of the separate conductances. And since conductance = $\frac{1}{R}$ mho.,

the separate conductances are, $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{5}$ mho., and the joint conductance of the three wires

$$= \frac{1}{2} + \frac{1}{4} + \frac{1}{5} = \frac{13}{20} \text{ mho.}$$

$$\therefore \text{resistance of new conductor} = \frac{1}{\text{conductance}} \\ = \frac{1}{\frac{13}{20}} = 1\frac{1}{13} \text{ ohm.}$$

Electrical Pressure.—Electromotive Force.—The Volt.—The remaining factor, electrical pressure, upon which the transference of electricity depends, is much more important and difficult to understand than either current or resistance. We have already observed that electricity is a form of energy, and that bodies electrified are capable of doing work. In other words, electrification is accompanied by the accumulation of a certain amount of energy, and any body brought into such a position or condition that in consequence it is capable of doing work, is said to possess potential energy. Electrically we say that the body has a certain potential, which means that it possesses so much or so many units of potential energy. Now, potential is a measure of the work which can be done, and work is done when electricity passes along a conductor, for then resistance (obstruction) is overcome, and it is found, and can be proved experimentally, that currents of electricity always result whenever we have two points in a conductor at different potentials. A similar phenomenon occurs when a body has two points at different temperatures, in which case there is a transference of heat from the point of higher temperature to the point of lower temperature, and so long as this difference of temperature is maintained there is a continuous flow or current of heat. Hence the following definition:—

The difference of potential, or P.D., between two points is that difference in electrical condition which tends to produce a transference of electricity from one point to another.

The term difference of potential is usually abbreviated by using the letters P.D. Now, if two bodies are electrified to different potentials, and they are connected by means of a wire, a rush of electricity takes place from the body of higher potential to the one of lower potential—that is, we have a discharge or momentary current, and as the result the two bodies are reduced to the same electrical condition. To have a continuous current it is evident that we must have something more than a P.D. We cannot here, of course, inquire into the process of transformation of any one form of energy into electrical energy, but must assume that with every generator there is a something produced which maintains a P.D. This something is called electromotive force, and, as the name implies, it is a force in the sense that it sets up a pressure or stress which is a manifestation of the electrical energy. The P.D. at the terminals of a dynamo or cell is a measure of this stress.

In every circuit energy is expended, some usefully in performing work, and some is dissipated by the resistance which has to be overcome. It is thus obvious that to continue this expenditure of energy some external force (electromotive force) is required to maintain a permanent P.D., and so keep up a continuous current of electricity, and any agency which enables this to be done is a source of electromotive force. Hence the following definition:—

Electromotive force is the originating cause or capability of maintaining a P.D.

The term “electromotive force” is usually abbreviated by using the letters E.M.F. We thus see that the relationship between E.M.F. and P.D. is the same as the relationship between force of gravity and water pressure or difference of water level. Both E.M.F. and P.D. are thus phases of energy, and it is because they are so intimately connected that so much confusion exists respecting them. Throughout these articles the term “E.M.F.” will be used to denote the measure of the electrical pressure generated, and the term “P.D.” to denote the measure of the electrical pressure between any two points in a circuit. The pressure utilised in the external part of the circuit—outside the generator—is the terminal P.D. of the generator.

Thus, if E be the E.M.F. of a generator, and e the terminal P.D., then—

$$E = e + e_1 \dots\dots\dots (4)$$

e_1 being the electrical pressure used internally in the generator.

In the system of practical units, the unit of E.M.F. is that pressure which is required to send one ampere through a resistance of one ohm, and is called the volt. This pressure is approximately the E.M.F. of a Daniell's cell. The terminal pressure, or P.D., of a generator is usually termed voltage (number of volts), and the following paragraph will help the student to distinguish between the different phases of electrical pressure.

“The term ‘E.M.F.’ should be reserved for the energy supplied, while the destruction of energy can be denoted by voltage. The voltage can always be measured by a voltmeter; but E.M.F. cannot always be so determined. Voltage must be caused by E.M.F.; but E.M.F. may exist without voltage. E.M.F. is generally local, while voltage is necessarily distributed. E.M.F. represents a condition of supply, which is generally fairly constant, however much power is supplied.”

Ohm's Law.—So far we have considered current, resistance, and E.M.F. individually, and without reference to their connection with one another; but as these three fundamental factors are always present in an active circuit, we shall now endeavour to give an accurate idea respecting them in a collective sense. The relationship between them, and dependence upon each other, are conveniently expressed as a law, which, on account of its importance as the fundamental law of electrical measurements, may be considered in the strictest sense a law of nature. It was discovered and announced by Dr. G. S. Ohm, a German physicist, in 1827, in his “Mathematical Theory of the Galvanic Circuit”; and, in honour of the great service he thus rendered to the science of electricity, it is justly known as Ohm's law.

From what has been said, it is obvious that the strength of a current is proportional to the pressure acting, and inversely as the resistance of the circuit. Ohm discovered that for the same conductors the ratio of the E.M.F. to the current is constant, or—

$$\frac{E}{C} = \text{a constant quantity,}$$

where E = E.M.F. and C = current strength. This constant quantity was discovered by Ohm to be equal in all cases to the total resistance of the circuit; and subsequent experiments have so often verified this, that we say—

$$\frac{E}{C} = R$$

expresses in an algebraic or mathematical form the relationship known as Ohm's law. It is clear that, given any two of the three quantities, we can, in a simple manner, determine the third, for by transposing one term we get $E = C \times R$, and by a further step we get $C = \frac{E}{R}$. This

form is probably the most useful practically; but to those only slightly acquainted with algebraic statements, the following will, perhaps, be the most serviceable way of remembering Ohm's law—

$$\text{Amperage} = \frac{\text{voltage}}{\text{ohmage}},$$

where ohmage is used to denote the number of ohms resistance in the circuit. Expressed in words, Ohm's law is as follows:—The strength of the current varies directly as the E.M.F. and inversely as the total resistance of the circuit. Collecting the algebraic forms of this law, we have—

$$\left. \begin{aligned} C &= \frac{E}{R} \\ E &= CR \\ R &= \frac{E}{C} \end{aligned} \right\} \dots\dots\dots (5)$$

We shall now illustrate this important law by giving some worked examples:—

Worked Examples on Ohm's Law.—1. A dynamo generating an electrical pressure of 120 volts sends a certain current through a circuit, the total resistance of which (including dynamo, lamps, &c.) is 10 ohms. What is the current?

$$\text{Solution.—Since—} C = \frac{E}{R} \\ \therefore C = \frac{120 \text{ volts}}{10 \text{ ohms}} = 12 \text{ amperes.}$$

(2) A 10-cell Daniell's battery (E.M.F., 1 volt

each), whose resistance is 10 ohms per cell, is used to work a telegraph line eight miles long, the resistance of the line wire being 12 ohms per mile; determine the strength of the current in milliamperes, the resistance of the instrument being 200 ohms.

NOTES.—(1) A milliamperè is the $\frac{1}{1000}$ th part of ampère. (2) If in any circuit there are several sources of electrical pressure, or several portions of the circuit differing in resistance, then E and R in $C = \frac{E}{R}$ denote the sum of the pressures and resistances respectively, that is if $e_1, e_2, e_3 =$ individual pressure, and $r_1, r_2, r_3 =$ individual resistance.

$$\text{then— } C = \frac{e_1 + e_2 + e_3 + \dots}{r_1 + r_2 + r_3 + \dots} = \frac{E}{R} \dots (6)$$

If the source consists of n cells, each having a pressure of e volts and r ohms resistance, then if the cells be connected in series—

$$E = ne \text{ and } r_0 \text{ (of battery)} = nr \dots (7)$$

In addition to the resistance of the battery there may be the resistances of the leads, measuring instruments, lamps, &c. In the example, for instance—

$$C = \frac{E}{R} = \frac{n \cdot e}{r_0 + r_w + r_i} \dots (8)$$

where—
 r_0 = total resistance of battery.
 r_w = total resistance of leads or wires.
 r_i = total resistance of instruments.

Solution—

$$C \text{ (ampères)} = \frac{(10 \times 1) \text{ volts}}{[(10 \times 10) + (8 \times 12) + 200] \text{ ohms}} = \frac{10}{396} = 0.025 \text{ ampère.}$$

And since— 1 ampère = 1,000 milliamperes,
 $0.025 \text{ ampère} = 25.25 \text{ milliamperes.}$

3. Suppose that in the last example, it was required to reduce the current to 20 milliamperes, what additional resistance would you interpose in the circuit?

Solution.—Now 20 milliamperes = .02 ampère, and if R = resistance added, $396 + R =$ total resistance, and—

$$.02 \text{ (ampère)} = \frac{10 \text{ volts}}{(396 + R) \text{ ohms}}$$

$$\therefore 396 + R = \frac{10}{.02} = 500,$$

and— $R = 500 - 396 = 104 \text{ ohms.}$

4. A telegraph line having a resistance of 100 ohms has a ten-cell battery connected to it, each cell having a resistance of five ohms. By how much would the current flowing be increased if the number of cells were doubled, the cells being joined up in series?

Solution.—Let $e =$ E.M.F. of each cell. Then in the first case—

$$C_1 = \frac{10e}{100 + (10 \times 5)} = \frac{e}{15} \text{ ampères,}$$

and by doubling the number of cells—

$$C_2 = \frac{20e}{100 + (20 \times 5)} = \frac{e}{10} \text{ ampères.}$$

By forming a ratio between C_2 and C_1 we have—

$$\frac{C_2}{C_1} = \frac{e}{10} \div \frac{e}{15} = \frac{15}{10} = 1.5$$

that is, the current flowing is increased 50 per cent.

5. How many volts are needed to send a current of 20 ampères through a conductor having 10 ohms resistance? What difference would it make in your answer if the circuit included a motor having a back-electromotive force of 450 volts?

Solutions.—First part: $E = C \times R = 20 \text{ amps.} \times 10 \text{ ohms} = 200 \text{ volts.}$

Second part: If a circuit contains any source of back-electrical pressure (e volts, say), as when motors and electrolytic cells are included, the formula for Ohm's law becomes—

$$C = \frac{E - e}{R} \dots (9)$$

from which we get—

$$CR = E - e, \text{ and } E = CR + e.$$

$$\therefore E = 20 \times 10 + 450 = 650 \text{ volts.}$$

(To be continued.)

RULES FOR MAKING GOOD MORTAR.

MORTAR for the plasterer's use should be well made, and the following rules should, says the *U.S. National Builder*, be strictly complied with when making: First, the lime should

be thoroughly slaked, and brought to a paste or putty state; second, it should remain in the mortar bed until it is perfectly cool before mixing in the sand and hair; third, good mortar may be used with safety eight or ten days after it is made; but in no case should it be used before it is six days old.

Some authorities say it is best to use mortar for plastering within three or four days after it is first made. They claim that, in mortar which stands ten or more days before using, the lime loses a portion of its strength, and the mortar becomes deteriorated thereby. This, to a certain extent, is true; but, notwithstanding the loss of strength by the lime, and the consequent deterioration of the mortar, every observant plasterer knows that walls coated with mortar made two or three weeks previous to using stand better than those coated with "green" or freshly made mortar. Newly-made mortar, immediately applied, frequently causes the walls to chip, crack, and become mottled. Mortar well tempered, and as well seasoned, works better and cooler than the hastily-made new mortar, and invariably gives better satisfaction. Colonel Gillmore, quoting from Vicat, and apparently endorsing the statement, says: "It was supposed, for many years, that the longer the lime was slaked before it was used the better mortar it would make. Recent experiments prove, however, that this is not the case with mixtures of fat lime and sand only. Better results are obtained with such mortars if the paste be mixed with the sand as soon as the slaked lime has become cold, and care should be taken to use no more water, in the process of extinction, than may be required to produce a thick pulp."

In slaking lime, care should be taken that neither too much nor too little water is used. If too much is used, the lime will be "chilled," and lose a part of its strength; if too little, it will "burn," and a portion of it will pass into the bed unslaked and cause trouble there.

As the quality of lime varies in different localities, it is impossible to give the exact proportion of sand to be used to each bushel of lime.

The hair should be mixed with the lime and sand at once, for mortar should never be wetted up a second time. For the first coat on lath it will be necessary to use about two pounds of hair to every bushel of lime slaked, and the mortar should have only a sufficiency of sand in it to keep it from cracking while setting, as it requires to be "pasty" enough to stick firmly to the lath and "clinch" or "bond" securely between and behind them.

In many places the plasterer has also to lath the work he is to finish; when such is the case, he should make it a rule never to have more than $\frac{3}{4}$ in. key between each lath. Joints should be broken every 16 in., and more frequently if the conditions will admit. If twenty or thirty laths are nailed so that the ends all joint on one stud, it will soon show itself, as the plaster will certainly crack at that point when the studs dry and shrink. In lathing for outside work, if the building has been first boarded, it is better to nail the lath on diagonally—say, at an angle of about 45° to the base of the building, and 1 in. apart; then cross these laths again at right angles with another tier, nailing them on to the first lath, leaving spaces about $\frac{3}{4}$ in. between them.

This method of lathing is a trifle more expensive (about one-fifth) than the ordinary way, but it insures good work, and if the frame of a house is well put together and firm, so that the wind will not rack it, the plastering will stand longer than either clapboards or siding for outside work. This method of lathing is extensively adopted in the Province of Quebec, Canada, and the Maritime Provinces, and when a little rye whisky is used in the making of the mortar—say, about one gallon to every twenty bushels of lime, into which it is thoroughly mixed—much strength and durability will be added. Many buildings which are known to have been plastered more than fifty years ago are as good now as when the work was first completed, where these precautions were adopted.—*The National Builder.*

BOOKS RECEIVED.

A Price-Book for Approximate Estimates for Architects, Engineers, &c., by T. E. COLEMAN, F.S.I. (London: E. and F. N. Spon, Ltd.), is a handy pocket reprint of a series of useful papers contributed some little time back to this journal. Readers who appreciated them will probably be

glad to get the papers in this cheap and convenient form.—*Universal Directory of Railway Officials* for 1897. This handy book of reference, compiled from official sources by S. Richardson Blundstone, the editor of the *Railway Engineer*, and published at 8, Catherine-street, Strand, W.C., has now reached its third year of publication. Into its 350 pages a vast amount of reliable information on all railway matters is closely packed. The principal additions made to the present issue relate to the Selangor and Perak State Railways, Belgian and other Continental light railways, Japanese and Chilean State Railways, the railways in Africa and Siberia, and further particulars as to the principal United States lines. Twenty-six pages have been added to the foreign and colonial section of the directory, and the personal list is proportionately larger than last year. The length and gauge of every railway is given in English measurements.

TREAT'S NAIL-HOLDING DEVICE FOR HAMMERS.

AN attachment to carpenters' hammers, for placing a nail in the position where it is to be driven, is shown in the accompanying illustration,

the hammer and its attachment being then disconnected from the nail, and the latter driven in the usual way by the use of the hammer. The device has been patented in the United States by Albert R. Treat, of No. 1333, De Long-street, Los Angeles, Cal. Fig. 1 represents the application of the device, and Fig. 2 is a bottom plan view. It comprises a clamp and a jaw-holding casing, preferably formed from one piece of metal, the clamp opening sufficiently to be passed over the handle, close up to the shank of the head of the hammer, where it is secured in position by a screw. Within the casing, and extending at the side of and over a slot in its bottom face are two pivoted jaws, normally held closed by a spring, these jaws engaging and holding the nail-head as it is slipped into the slot, as indicated in Fig. 2, and the nail-head being thus held between the jaws and the shank of the hammer-head. With the nail held in such position it may be readily started in the surface where it is to be driven. The spring and jaws being entirely within the casing, there are no parts of the device liable to catch in the workman's clothes.—*Scientific American.*

The High School for girls at Truro is on the eve of completion. It has been built by Mr. John Colliver, of that city, from plans by Mr. E. R. Robson, F.S.A., of Westminster.

A sculptured reredos and marble chancel steps have been erected in Edmond church to the memory of the late Rev. C. F. C. Pigott, canon of Lichfield and rector of Edmond. The cost of the memorial has been four hundred guineas.

On Saturday afternoon Miss E. Walker set in motion a new illuminated clock, fixed in the tower of the parish church of Slaithwaite, near Leeds, to commemorate the Queen's long reign. The clock has three external dials, each 6 ft. in diameter, and has been built by Messrs. William Potts and Sons, of Leeds.

The annual exhibition of amateur art work under the auspices of the Artists' Guild will be held at the Imperial Institute from November 1 to 13. Prizes are offered for embroidery, fans, oil, pastel, and water-colour painting, wood-carving, photography, &c. Princess Christian offers prizes for embroidery from the Royal School of Art Needlework designs. The judges this year will be Mr. W. P. Frith, R.A., Mr. H. Stacy Marks, R.A., Mr. Walter Severn, Mr. Leslie Ward, Mrs. E. M. Ward, Mrs. Jopling, and Miss Rowe.

Building Intelligence.

ALRESFORD.—Sir Arthur W. Blomfield, A.R.A., reports that, on further examination of the parish church, he finds that the posts supporting the nave roof are in an extremely unsound state. One was split from top to bottom, and a collapse, with a part of the roof falling, might have occurred at any moment. The unsoundness of the posts was not visible, as they were cased. If the posts were removed, it would be necessary to disturb a large portion of the roof, timber, and as those are shaky and twisted, it would be almost impossible to replace them. Under those circumstances, he recommends that "columns and arcades, with clerestory windows, in stone of a similar character to those existing before the fire, should replace the existing wooden construction. The estimated cost of an entirely new roof to the nave in oak, with nave arcade and columns, and clerestory windows in stone, is approximately £1,000 beyond the present contract. An interesting discovery of an Early English window has been made, and also extensive remains of the Perpendicular period. The foundations of the new chancel are also found to be on exactly the same lines as those of the Perpendicular church, the latter having been brought to light in the course of the restoration.

BLACKPOOL.—The old Prince of Wales Theatre has been demolished, and on its site is being built the Alhambra Music Hall, at a cost of over £100,000. The architects are Messrs. Wylson and Long, of King William-street, Strand. The style is Renaissance, treated freely, and the elevation to the promenade of stone, a feature being two wide projecting balconies carried on marble columns. The main entrance in front leads to a hall, in which the booking-offices will be situated. To the left will be a circus, and above it a dancing-hall, and on the right a variety theatre. The lower part of the front consists of an arcade and five shops. The circus will be seated to accommodate at least 2,000 people. There will be two entrances—one from the promenade and the other from Bank Hey-street. The ring is to measure 60ft. by 40ft., and arrangements are made whereby a portion of this area can be transformed at will into a bath, in which swimming entertainments can be given. The stabling for the horses will be situated under the tiers of seats. The dancing-hall overhead has been an afterthought; it will extend from front to back of the building. The tender of Messrs. Whitehead, of Blackpool, has been accepted for the erection of the general building work, furnishing, and decorations, at a cost of £76,200, and that of Mr. Samuel Butler, of Leeds, for the constructional ironwork, at a cost of £12,788. Messrs. Shoobred's tender for the seating is £6,500.

BOLTON.—The opening ceremony in connection with the new central higher grade board school, Bolton, was performed by Sir George Kekewich, K.C.B. (permanent secretary of the Education Department) on Thursday week. The new school provides accommodation for 1,080 scholars, and has been erected, including the site, at a cost of £32,000. The style is Renaissance, and the building is four stories in height, is lighted by electricity, and heated and ventilated on the most modern lines. The accommodation provided includes central halls on each floor, measuring 96ft. by 32ft., a gymnasium, physical and chemical laboratories, and lecture rooms; manual instruction room, kitchen and dining room, preparation and dark rooms, drawing instruction rooms, a series of classrooms on each floor, and apartments for the masters, and necessary equipment of store-rooms, lavatories, &c. A caretaker's house, with cookery school over, is also provided in a separate building. The whole of the work has been carried out under the supervision of Mr. R. Knill-Freeman, F.R.I.B.A., of Bolton, whose design was selected in competition, confined to local architects, by the assessor, Mr. E. R. Robson, the architect to the Education Department. The contractors for the work were Messrs. E. and D. Maginnis, also of Bolton, and Mr. David Walsh has acted as clerk of works.

EDINBURGH.—The board schools in Edinburgh were reopened on Tuesday. The older schools have been freshened up by painters: in two instances—North Merchiston and Gorgie schools—large additions have been made; and the new school at Preston-street was opened for

the first time. The accommodation provided in the new school is 339 seats for infants and 532 for juveniles—total, 871. There is also provided a gymnasium and a cookery and workshop department. The additions to Gorgie School will give space for 694 infants and 925 juveniles—a total of 1,619 seats. A gymnasium measuring 1,200ft. super. has been provided, besides a cookery and workshop department, giving 867sq.ft. At North Merchiston the additional accommodation provided is sufficient for 759 infants. A gymnasium measuring 1,200ft. super. has likewise been provided here, and also a cookery and workshop room.

FARSLEY.—A new board school erected by the Calverley United District School Board in New-street, Farsley, was opened on Tuesday. The school, in design, is in keeping with the infant schools adjoining, erected some years ago. The block is composed of a central hall 55ft. long, 31ft. wide, and 26ft. high, with five classrooms, all opening into the central hall. The classrooms and entrances have glazed partitions. The central hall has been provided with a solid wood-block flooring. Separate entrances, cloakrooms, and lavatories are provided for boys and girls, who have each also separate covered and open playgrounds. The schools provide accommodation for 340 scholars, and the cost, exclusive of the furniture, is about £3,000. The various works have been carried out from the architect's designs by—mason and joiner work, Messrs. Appleyard Bros., Bramley; slaters, Messrs. T. and A. Thornton, Eccleshill; plumbing, gas-lighting, and heating apparatus, Mr. Alfred Higginbotham, Idle; plastering, Messrs. J. Laycock and Sons, Stanningley; painting, Mr. D. E. Hutton, Shipley; wood-block flooring, Mr. Roger Lowe, Farnworth.

GATESHEAD.—The district church of St. George, in the parish of Christ Church, Gateshead, was consecrated, on Friday, by Bishop Sandford. The building has been constructed from designs by Mr. Stephen Piper, M.S.A., 52, Westgate-road, Newcastle, selected in competition, is capable of accommodating 624 persons, and is situated at the top of Durham-road. It is a plain and substantial stone structure, 13th Century in style, and consists of nave, 27ft. wide, north and south transepts and aisles, chancel, and organ-chamber, and clergy and choir vestries. The building has cost, with the tower, £6,400, and in the tower there is a peal of eight tubular bells, costing £200, which have been supplied by Messrs. Walker and Coxon, of Newcastle, who have also put in the gas fittings. The reredos was designed and executed by Mr. Ralph Hedley, of Newcastle. The contractor was Mr. Alexander Pringle, Gateshead. The glazing has been done by the Gateshead Stained Glass Company, and the heating by Messrs. Dinning and Cooke, of Newcastle.

SEELY OAK.—The new workhouse infirmary adjoining the workhouse at Seely Oak, just built for the King's Norton Board of Guardians, was formally opened on Saturday. The land slopes from east to west about 1ft., an inclination which has been taken advantage of in the planning of the pavilions, of which there are four, with sufficient space for an extension of another four. The administrative department is in the centre, with the laundry, boiler-house, engine-house, dynamo-rooms, and water-tower at the rear, the whole covering an area of about six acres. The buildings have been erected by Mr. Thomas Rowbotham, Small Heath, from the designs of Mr. Daniel Arkell. A departure has been made from the generally acknowledged workhouse style, the principle adopted being to make the different rooms light and cheerful for the patients, and the surroundings pleasant and agreeable for those who have to attend on them. Externally the buildings are of red brick, relieved by dark-red coloured bricks and terracotta strings, the roofs being covered with bright-red Broseley tiles. The style is a free treatment of Renaissance. Accommodation is provided for about 300 beds for patients and officials, whilst provision has been made for a future extension of a similar number. In the centre are the one-story kitchen block and administrative buildings, which are connected to the building by covered ways. The doctors' rooms, nurses' general sitting-room, sewing-rooms, matron's rooms, steward's stores, dispensary, telephone-exchange room, and nurses' and servants' residences are in the centre and under the supervision of the matron, with lavatories, bath-rooms, &c., complete. The cooking kitchen,

sculleries, pantries, stores, &c., are at the rear of the administrative block, centrally placed. Adjoining the central block, and off the main corridor, are placed the receiving wards for male and female patients. The pavilions are axially arranged nearly north and south, with fire and sound proof floors. There is no direct internal communication between them, the upper floors being reached by an external staircase, opening from the staircase. A long wide corridor leads left and right to the different rooms, which comprise eight wards for 24 beds each, eight wards for five beds each, and eight wards for two beds each for special cases. The large wards are overlooked from the nurses' duty rooms and kitchens by a small window. The labour wards are provided for five beds each, and two separate wards of one bed each at the end of the north female pavilion, to be used for maternity cases, these wards being cut off from the main pavilion by corridors. Two large wards are lighted by means of windows on either side; all angles and corners are rounded, and the whole of the floors are of marble mosaic. Access and egress fireproof staircases are provided to each block, and balconies at each end of the pavilions for the use of convalescent patients. The male and female pavilions on the first floor are connected with the official block by a wide open asphalted roadway, which forms the roof of the corridor beneath. It was originally intended to heat the new building from the workhouse boilers; but, in consequence of the Local Government Board's requirements, the guardians have built a boiler-house, engine-house, dynamo-rooms, laundries, and water-tower at the rear of the new building, together with three large boilers and a tank in the water-tower. Adjoining the boiler-house are coal stores. Near to a high chimney-shaft is the engine and dynamo-room, in which are placed powerful steam-engines to create the electric supply for lighting the whole of the rooms in the infirmary, and also the arc lamps to illuminate the grounds at night. No gas-pipes are laid in any portion of the building, which is entirely dependent on the electric light, there being sufficient storage in the accumulator-house for one night's supply. The total cost of the infirmary has been £45,000.

SPENNYSMOOR.—On Wednesday, September 1, the foundation-stones of the new Sunday-school, in connection with the Baptist Church, Spennysmoor, were laid. The building, which is situated at the rear of the church, consists of a lecture-hall or schoolroom, 33ft. by 33ft., with classrooms on each side. The lecture-hall is lighted by large windows at the end, and also by clerestory windows over the classrooms. The classrooms are separated from the hall by folding partitions, so that the accommodation in the hall may be increased when necessary. Ample ventilation is provided by means of clerestory windows, and by an exhaust ventilator on the roof. It is intended ultimately to renovate and reseat the church, build a new baptistry and platform, and form a new connection between the church and the new school. The work is being carried out from the plans and under the superintendence of Mr. J. Walter Hanson, architect, of South Shields and Jarrold, and the builder, Mr. R. Telfer, of Spennysmoor, Durham.

SHIELDMUIR, N.B.—Bishop Maguire will lay the foundation-stone of the chancel arch column of the new Roman Catholic Church of St. Patrick at Shieldmuir, near Motherwell, on Saturday. The church when completed will seat 1,000 persons. Designed in the Early Decorated style, the building will consist of chancel, nave, side-chapels, aisles, baptistry, sacristies, confessionals, &c. The internal length is 125ft. by 58ft. in width, and the internal height 58ft. Red sandstone is being used in the construction, and the estimated cost is £6,250, the designs being by Messrs. Pugin and Pugin, London. The nave, 97ft. long and 28ft. wide, is divided into seven bays. The chancel, apsidal in form, is divided from the nave by a chancel arch. A feature of the church, however, is the western façade, in which are placed the two doors, deeply arched and recessed. The gable is supported both by buttresses at the sides and one in the centre, in which latter a niche has been placed to receive a statue of St. Patrick. Between the buttresses are two arched recesses 39ft. in height, and in these will be placed two four-light windows. The gable terminates with a stone cross.

It is stated that the unique western screen-front of Exeter Cathedral is being repaired and renewed under the direction of a local architect.

Engineering Notes.

DOVER.—The Admiralty selected list of contractors who will tender for the construction of the National Harbour at Dover have received an intimation that the plans and specifications of the works are ready. According to this, the tender should be in the hands of the Government authorities in a few weeks from the present time. The work at the eastern and western ends of the harbour will be proceeded with simultaneously, so as to expedite the construction. The lengthening of the Admiralty pier seaward, which will form the western arm, is to be proceeded with at once, as it is necessary for the protection of the enlarged Continental and commercial harbour which is being constructed by the Harbour Board. Before the eastern arm can be commenced, a considerable area of the foreshore under the cliffs is to be reclaimed.

GLOUCESTER.—The construction of the Midland Railway Company's new dock branch at Gloucester has been commenced by the contractors, Messrs. Cruwys and Hobrough, of Birmingham. The new line will be about two miles long, and will connect the company's main line at Tuffley with the existing dock railways on the east and west sides of the Gloucester and Berkeley Canal. The fall from the Tuffley end will be 1 in 80. To secure this there will be three cuttings, which will involve the removal of some 60,000 cubic yards of earth. Five bridges will have to be constructed—three occupation bridges, a bridge to carry the Bristol main road, and a swing bridge over the canal. The line will be a single one except at the two last-named bridges, which will allow of a double set of rails. The new main railway will be 35ft. wide, and the gradient 1 in 35; the bridge will be of brick, with three arches, two of 24ft. each and one of 28ft., and the approaches will call for 22,000 cubic yards of material. The bridge over the canal—which at this point is over 300ft. wide—will be of steel and built on brick abutments, and it will swing on a pivot upon a steel caisson, 20ft. deep and 16ft. in diameter, sunk in the bed of the canal. The bridge and the caisson will weigh 140 tons, the weight of the caisson being 11 tons. Over one million bricks will be used in the bridges, &c. Fourteen months are allowed for the completion of the line. The carrying out of the contract will be under the superintendence of Mr. W. F. Hobrough, who has taken up his residence in Gloucester for that purpose, in conjunction with Mr. Brunton, Midland Railway Company's resident engineer.

HAVANNAH.—Last December Messrs. Swan and Hunter, of Wallsend, contracted with the Spanish Government to build what will be the largest floating dock in the world, and have now completed the job, although some important changes were necessary in their yard to permit of this class of work being undertaken there. From the time of laying the first plate to the launch of the completed dock has needed a period of six months only. The dock in question has been designed by Messrs. Clark and Standfield, Westminster, and is to be installed at Havannah, where it will afford a means of docking the largest ironclads in the Spanish navy. The dock consists, in the first place, of the pontoons, five in number, which give the requisite buoyancy, and of the high side walls which regulate the immersion of the pontoon, and secure the requisite stability. In addition, there are movable caissons or end-gates, only to be used when it is necessary to increase the lifting power. Of the five pontoons, the three middle ones are rectangular, while the end ones are pointed at the ends. All these pontoons are uniformly 87ft. wide, the middle ones being 75ft., the end ones 108ft. 4in. long. A space of 2ft. is left between the pontoons, which lie wholly between the side-walls, to which they are strongly bolted. The over-all length of the dock is 450ft., the width between the broad altars 82ft., and the depth over the sill 27ft. 6in. When immersed to this extent, the dock draws 42½ft. of water, the freeboard being then 4ft. 2in. The whole is designed so as to be self-docking. Any particular pontoon can be detached and docked for examination and repairs, whilst the under-water portions of the side-walls can be got at by careening the whole structure. The pumping machinery has been supplied by Messrs. J. and H. Gwynne, of the Hammersmith Ironworks, and is capable of lifting the dock with a 10,000-ton ironclad on board in 2½ hours. These pumps are driven by

electric motors supplied, together with the necessary generating plant, by Messrs. Scott and Mountain, of Newcastle. The tanks which control the flotation are 30 in number, each pontoon being divided up into four watertight compartments, whilst the walls below the engine decks are each divided into five such compartments. The pumping plant is in duplicate. The dock is to be towed out to its destination, and left the Tyne on Tuesday last. For the voyage it has been fitted with a fore-mast and square sails, and with a jigger mast aft. Steam-steering gear is also provided.

LEOMINSTER AND BROMYARD RAILWAY.—The new line between Leominster and Bromyard was opened on Friday. The line from Worcester to Bromyard was commenced in 1860, but for many years only extended from the former city to Yearsett; but more capital being raised, the line was opened as far as Bromyard in October, 1877. The scheme for a line from Leominster to Bromyard had to face many difficulties, and passed through many changes. In 1880 the line was made as far as Steen's Bridge. In 1893 this line was acquired by the Great Western Railway Company, an agreement to complete the line being made. The contract was let to Messrs. Baldry and Yerburch, of Westminster, who commenced operations in April, 1894. The work presented no great engineering difficulties, but some of the cuttings involved considerable labour. That at Fencote is about three-quarters of a mile long, and is 35ft. at the deepest point; while that at Foxholes, almost entirely through stone, is 40ft. deep. About 550,000 tons of material had to be removed from the various cuttings. All the bridges have been made of local stone. The stations are of red brick, and attached to them are the station-master's house and plate-layers' cottages.

UNDERGROUND RAILWAY FOR NEW YORK.—The commission of three appointed by the Appellate Division of the Supreme Court of the United States to report upon the tunnel railroad proposed by the Rapid Transit Railroad Commission of New York City is now engaged in taking testimony from the commissioners, the chief engineer, and the property holders along the route of the road. The data furnished by the engineer places the prospects for building the road in a better light than they have presented at any time since the original scheme was first mooted, and the latest estimates show that the probable cost of the road will be less than that originally estimated for the amended scheme. According to the present plan, a trifle over 20 miles of road will be built under New York. This will reach from the post office to the Kingsbridge Station on the west side, and to Bronx Park and the Boston-road on the east side. Although this is about two miles longer than the route first proposed, known as the Broadway route, it involves two miles less of four-track tunnel. The estimated cost of the route which was vetoed by the Appellate justices was about 50,000,000 dol., whereas the estimated cost of the present proposed route beneath Elm-street will not be over 32,600,000dol. This total will be considerably reduced if the commissioners persist in their decision not to put up any pipe galleries at their own expense, and to replace the proposed enamelled-brick tunnelling with painted cement concrete—a change which will probably be made. This would effect a saving of about 2½ million dollars, and would reduce the cost of the completed tunnel to something under 30,000,000dol. The preliminary borings which have been made through Center-street, Elm-street, Fourth-avenue, and the district beyond indicate that the work of excavation will be easier than was at first anticipated.

The foundation-stone has been laid of a new parish church for All Hallows, near Aspatia. The old church dates back to the 13th century, accommodates only eighty persons, and is in a state of disrepair. The new church will cost about £2,500, and will accommodate about 250 persons.

A suite of Turkish baths has just been constructed in St. Sampson's-square, York, from designs by Mr. F. Stubbs, of that city. The works have been carried out by Messrs. Thomlinson, Walker, and Son, of the Victoria Ironworks, York; Messrs. Boswell and Anderson, Layerthorpe, bricklaying; Mr. James Creaser, joinery; Mr. Atkinson, Walmgate, marble-work; Mr. Geo. Huggins, tiling; Mr. Lupton, Monkgate, glazing and gasfitting; and Mr. Edward Hodgson, Penley's Grove-street, slating.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

AUCTIONEERS' INSTITUTE.—The autumn meeting of the Auctioneers' Institute, which numbers close on 900 members, was opened at Cardiff yesterday (Thursday) under the presidency of Mr. James F. Field, of London. After a reception of the council by the Mayor at the town hall in the morning, the day was devoted to the transaction of business and the consideration of a large number of applications for membership, and was followed in the evening by a smoking concert, by invitation of the local committee. To-day (Friday) will be occupied by a round of excursions to the various places of interest, during which the party will partake of luncheon at the residence of Mr. D. T. Alexander, Dinas Powis. In the evening there will be a dinner at the Park Hall, when the president will be supported by the Mayor, local members of Parliament, representatives of the kindred professions, and of commerce. The proceedings will end with a visit to Cardiff Castle to-morrow (Saturday).

LEEDS MASTER BUILDERS' ASSOCIATION.—The annual meeting of the Leeds Master Builders' Association was held at the Royal Exchange, Leeds, on Tuesday, Mr. W. Nicholson presiding. The following officers were appointed for the ensuing year:—President, Mr. W. Nicholson; vice-president, Mr. J. Walker; and secretary, Mr. E. Schofield. It was stated that the association is in a very strong and healthy condition, notwithstanding the recent strike of bricklayers and labourers, the membership having largely increased since last year. Amongst other important business, it was unanimously decided that the association should join the Yorkshire Federation of Builders, the next meeting of which will be held in Leeds on the 16th. The trade of the city was reviewed during the meeting, and it was stated that things were quieter than they had been for some time. The members were afterwards entertained to tea at the Queen's Hotel by the President.

CHIPS.

The town council of Much Wenlock have adopted a scheme of water-supply for the town, prepared by Mr. Wyatt, C.E., and estimated to cost, in execution, about £2,500.

The four basins at Moon Island, that were built in 1884, for the storage of the sewage of Boston, Mass., are about to be duplicated by a new set covering five acres, and having a capacity of 25,000,000 gallons. They will be built with 17½ft. retaining walls and concrete floors, and the whole set, being emptied twice a day, will have a capacity of 100,000,000 gallons in twenty-four hours.

The assembly rooms at Crawshawbooth, Lancs, have just been reopened after extensive improvements. The architect was Mr. J. H. Spencer. The joiners' work has been carried out by Councillor Birtwistle, and the masons' work by Mr. R. Birtwistle. Mr. Miles Lonsdale has fitted up the heating apparatus.

The president of the New York Fire Department has been collecting some statistics which show that the losses by fire have been rapidly diminishing in the city for the last ten years, a fact which he attributes to the increasing efficiency of the fire brigade service. In the first six months of 1888 there were 1,736 fires, with a total loss of 3,751,519dol., or an average of 2,155'25dol. for each fire. Since then, while the number of fires has increased, the average loss has decreased quite steadily, so that in 1896, it was 923'28dol, and in the first six months of 1897 it was only 575'50dol.

A Local Government Board inquiry was held at Bootle on Tuesday, by Colonel Albert C. Smith, R.E., into an application for leave to borrow £2,027 for paving Litherland-road with granite setts; £1,293 to replace the cobblestones with granite setts in Dacre-street, a warehouse thoroughfare between Derby-road and the docks; and £864 for rounding the corner of Marsh-lane at the junction with Hawthorn-road, which is opposite to a new road Lord Derby is constructing in an oblique direction to Hornby-road, Walton, to replace the old foot-path across Walton fields.

The town council of Edinburgh received on Tuesday a letter from the secretary to H.M. Office of Works, intimating that from the 1st April next the fee now paid for admission to the historical apartments of Holyrood Palace will be abolished, on the understanding that the magistrates and council will extend the present police assistance to the six days a week during the summer months free of expense, also that the hours of admission to the apartments from the 1st of April will be from 10 a.m. to 5 p.m.

COMPETITIONS.

HARRISBURG, PENN.—It is reported that the competitors for the new State Capitol for Pennsylvania, proposed to be erected at Harrisburg, have found it impossible to provide the accommodation scheduled within the sum specified as the limit, 350,000 dollars, and of the eight designs recommended by the expert jury to the Capitol Commission, not one, the jury believe, can be carried out for the sum prescribed. As not only this sum, but many of the other conditions set forth in the programme, are fixed by statute, the Commissioners, who are strictly bound by the statute, are placed in a dilemma. There is a possibility that they may try to escape by rejecting all the competitive designs, and holding a new competition, or selecting some architect of their own, and letting him try to design and carry out such a building as they want for the price set by the statute. The objection to this plan is that it may raise controversy and litigation with the competitors whose designs have been selected by the experts.

NEWCASTLE-ON-TYNE.—In consequence of Mr. John Hall's munificent offer to build a new hospital at a cost to himself of £100,000, providing the corporation will grant a site on the Castle Leazes, the secretary has been instructed to intimate to each of the local architects who have responded to an invitation, and are preparing competitive drawings, that, in consequence of the offer of Mr. Hall, there is a likelihood of the site of the new infirmary being changed, and that the committee request them to delay in the meantime the preparation of their competitive designs, on the understanding that the time stated in the conditions of the competition will be proportionately extended after a decision has been arrived at.

RUGBY.—At the meeting of the Urban District Council, held a few days since, the special committee for selecting plans for municipal buildings reported that they had considered the 39 sets of plans submitted in competition, and unanimously recommended the council to adopt as the design for the first premium the plans marked "Avon B," and to award the second premium to the author of the plans marked "Ritaplan." The committee further recommended that the authors of the design "Avon B" be engaged to carry out the work, and that the council instruct them to proceed at once with the preparation of the necessary drawings, &c., so as to be able to commence the work early in the New Year. Some objection was raised, when the report came up, to the committee having only submitted two sets of plans, instead of allowing the whole body a choice between some four or five of the most suitable, and after some further discussion, in the course of which it was mentioned that the estimated cost of the design recommended for adoption was £5,000, it was decided that the seven sets of plans from which the final selection was made by the committee should be arranged in the Council Chamber, so that for the next fortnight each member should have an opportunity of inspecting them.

WESTON-SUPER-MARE.—The urban district council held a meeting on Friday with reference to the plans for reconstructing the market premises. A letter was read from the architects, who respectfully pointed out that they had never received any instructions to prepare a scheme to cost either £3,000 or any other sum unhampered by conditions as to what the scheme was to be. They were quite prepared, and always had been, to produce a scheme for £3,000, provided no other conditions were attached. They, however, doubted whether such a scheme would meet with the approval of the council or the Local Government Board. It was proposed that the architects be asked to send in their account, as there is no intention on the part of the council to carry out a scheme of so expensive a character as that for which plans have been prepared. An amendment was moved to appoint a sub-committee to confer with the architects on the understanding that no plans should be adopted that should cost more than £3,500 to carry out. The amendment was rejected by six votes to five, and the proposition carried by the same majority, and subsequently confirmed.

Very little was done at the Auction Mart last week, the aggregate realisation, as registered at the Estate Exchange, being £10,370, as against £13,997 for the corresponding period of 1896. Sales were held on four days, but on two of them no transactions whatever were effected.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 60s. 30c. gold). To France or Belgium, £1 6s. 0d. (or 83fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—S. B. P.—A. M. C.—B. B. and Son.—W. R.

Intercommunication.

QUESTIONS.

[11771.]—**Cooperage.**—Will anyone accustomed to make vats, coolers, and tuns for brewhouses kindly inform me the best kind of wood, and the best mixture to joint the same? as I have been given to understand white wood gives less taste to the beer than any other kind of wood. Also, is white lead the mixture to joint with? If anyone that has had experience will kindly inform me if that is so, he will oblige.—A THIRTY YEARS' SUBSCRIBER.

[11772.]—**Spire.**—Can any reader give any information as to the best methods of construction of spires, with special reference to brickwork? Also as to the method of determining the entasis of the same?—LECTOR.

[11773.]—**Dover and its Neighbourhood.**—Besides the castle and the old parish church of St. Mary the Virgin, Cannon-street, and one or two other interesting churches, there appears to be little of architectural interest. Will any of your readers favour a visitor here with any particulars of rambles where old buildings can be seen, and any information that may be useful? Writer will be thankful for same.—A TOURIST.

[11774.]—**Flint Walls.**—How are these built and finished internally? Are the same recesses made for window frames, &c., as in brick walls? What kind of mortar should be used?—G.

[11775.]—**Foundations on Soft Ground.**—Are there any recent examples of carrying high buildings in this country on foundations consisting of concrete rafts or plate-forms, from 4ft. to 8ft. thick, having twisted m.i. rods imbedded in same? and are there any publications or papers dealing with this method of founding on soft ground, either in this or any other country?—J. J.

[11776.]—**Pumping Liquid Cement.**—Will any practical builder or engineer state if it is possible to pump liquid cement through, say, a 2in. pipe a distance of about 35ft.? It is desired to fill up a horizontal space (3in. to 6in. deep, and about 70ft. square) between ground and floor (which cannot be moved) so as to make it solid. If so, what proportion water to Portland cement, and what proportion cement to sand?—PUZZLED.

[11777.]—**Map and Plan Drawing.**—I should be glad if some reader would recommend me a good work on map and plan drawing. I have some works on surveying, and understand the measuring of land, but I wish to know the methods of delineating the outlines of fields, &c. What instrument is used to measure angles at the corners

of fields, and how are the sinuosities of a stream shown?—B. D. A.

[11778.]—**Wood Staining.**—I have an oak bookcase which has been stained a dark oak. What can I do to get the stain out, or at least to make it lighter?—E. T. B.

[11779.]—**Temperature of Brick-Kilns.**—I wish to know if there is any apparatus in actual use by manufacturers for ascertaining the temperature in such kilns as those for burning bricks, lime, cement, &c.?—B. D. A.

[11780.]—**Wood Polishing.**—Will some kind contributor give me instructions for polishing wood material, and how applied?—RUSTIC.

REPLIES.

[11751.]—**Trigonometry.**—A B is the pillar, CD the person whose eye is at C. Draw CE parallel to BD.

Then $AB = 60$; $CD = 5$; therefore, $AE = 55$. Also, the angle $ACB = 45^\circ$. We have to find BD or CE. Calling it x , and $ACE \theta$, we have—

$$\tan \theta = \frac{AE}{EC} = \frac{55}{x}$$

$$\text{and—} \tan BCE = \tan (45^\circ - \theta) = \frac{BE}{EC} = \frac{5}{x}$$

From these two equations we can eliminate θ , and find—

$$x = 64.2\text{ft. (nearly).}$$

—J. G. GRANT, 32, Amphil-square, N.W.

[11764.]—**Size of Girder.**—Taking the sketch section, the weight of brickwork over the girder will be found by taking its length over girder, 22ft., by the height of wall to eaves (deducting any openings like windows), and multiplying by the weight allowed for the required thickness per foot or rod. Having found the whole weight of wall, one-half of it may be supposed to act over the centre of girder. Having found this, the mode of finding the depth of girder and the size or dimensions of the flanges can be found by the ordinary rule. To detail the steps here will be superfluous, and I should recommend "Student" to study Prof. H. Adams's treatise on iron girders—it will give all he wants. The first part of question is obscure, unless it refers to brick walls carried on steel joists.—A. Z.

[11765.]—**Architect's Claim.**—"A Young Architect's" experience is, I am afraid, common. Contractors often copy architects' plans and elevations, and use them when they have an opportunity. I do not think "A Young Architect" can make any legal claim against the joiner or his friend. The contractor, of course, should have returned the plans after the building was completed for which architect was employed, and if he has not done so, "A Young Architect" may claim for his drawings. He may also charge joiner with having used his plans, but that is probably all he can do, especially if the plans are those of an ordinary house. At present, architects are in the unfortunate position of not being able to claim copyright of their designs, and this is a question that will soon have to be decided by the profession at large. No architect appears able to prevent anyone from copying his design.—ANOTHER ARCHITECT.

CHIPS.

The city surveyor of Liverpool (Mr. T. Sheldermine) has been directed by the corporation to prepare plans of an extension of the North Haymarket, and estimates of the cost of the work.

Although Lord Penrhyn's slate quarries were formally opened last week, progress in getting materials has necessarily been slow. So far there have been no runs of slate trains from the quarries to Port Penrhyn, and there is not a single slate on the quay.

The new intermediate schools, Islandrindod Wells, Radnorshire, are being warmed and ventilated by means of Shorland's patent Manchester grates, exhaust roof ventilators, and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The classes in architectural history and design, and in building construction at the Municipal School of Art, Birmingham, which opens for the session on Monday next, have been rearranged. Mr. W. H. Bidlake, M.A., A.R.I.B.A., will continue to teach architectural history and architectural design. Mr. Herbert T. Buckland has been appointed to assist him, on two evenings a week, with the class in architectural design (elementary stage); Mr. Alfred J. Dunn, A.R.I.B.A., Pugin scholar and honours candidate in building construction, will teach the last-mentioned subject on Mondays and Fridays, whilst Mr. Freeman Smith will lecture on architecture on Monday, and on practical plane and solid geometry on Tuesdays.

In the case of Thomas Brown, Armadale-road, Fulham, S.W., and New Kent-road, S.E., builder, the discharge from bankruptcy has been suspended for two years, ending August 11, 1899. In that of George Crook, Shawfield-street, Chelsea, S.W., builder, the discharge has been suspended for three years, ending August 11, 1900.

THE MEAT MARKET, YPRES.—CHRIST CHURCH, BRYN-Y-MAEN.—ST. JOHN'S CHURCH, HENDON.—NORTHERN POLYTECHNIC INSTITUTION.—ADDITIONS TO PADDOCKHURST, SUSSEX.—STACK BUILDING FOR PRINCETON UNIVERSITY.

Our Illustrations.

R.I.B.A. PUGIN STUDENTSHIP COMPETITION: MEDAL OF MERIT—THE MEAT MARKET YPRES.

This famous and suggestive façade furnishes an admirable subject for a careful detail drawing, such as that which we give to-day. The subject is the old Meat Market Ypres, which is now used as a museum. It is situated nearly opposite the well-known Cloth Hall, with which the lower portion of Late 13th-Century, in stone, is contemporaneous. The upper part, of 16th-century work, executed in buff bricks with stone dressings, is probably a rebuilding of the older work, and in the gables a still later rebuilding or restoration has been done. This latter is in red brick, the effect in colour being not unpleasing, as age has blended the contrast into a harmonious whole. Not the least interesting part of this façade is the beautiful treatment of wrought-iron ties. This is one of the drawings awarded Medal of Merit R.I.B.A. Pugin Travelling Studentship, 1897, to Mr. James A. Swan.

PARISH CHURCH, BRYN-Y-MAEN, NORTH WALES.

This church is being built on an elevated site in one of the most picturesque parts of North Wales, some three to four miles from Colwyn Bay. The church has seating accommodation for about 250 persons, and comprises nave and south aisle, entered by a south porch, with chancel, organ chamber, vestry, and a central tower containing a peal of tubular bells. The exterior walls are built of Lysfaen limestone, with Helsby stone dressings; the interior faced with Helsby stone throughout. The whole of the roofs, nave benches, screens, chancel stalls, and fittings are of oak, relieved with tracery; the body of the church is floored with oak blocks, the chancel with tiles. The church is being erected at the sole cost of Mrs. Eleanor Frost, of Min-y-Don, in memory of her late husband. The builder is Mr. Evan Jones, of Groeslon, near Carnarvon, Messrs. Douglas and Fordham, of Chester, being the architects.

ST. JOHN'S, WEST HENDON.

The church, of which Mr. Temple Moore is the architect, is of the Late Decorated type of Gothic style. The nave, chancel, and one aisle are at present complete, providing accommodation for 500 persons. The roof is covered with hand-made red tiles, while the facings are of a warm-coloured yellow stock brick. The copings and all outside stonework of windows, &c., are of Bath stone, from the Box Ground quarries. The inside stonework is in Monks Park Bath stone; the entrance doors are of teak. The church inside is spacious and lofty, the columns of the arcade are tall and slender, whilst the arches of the arcade and the ribs of the aisle vaulting, all moulded in small members, spring directly from the piers without the intervention of any cap. The nave,

chancel, and aisle are all vaulted, the nave and chancel with a long barrel-vault from end to end, divided with panels, with mouldings worked in with the arched moulded trusses of the roof, these latter springing from small vault shafts also developed out of the mouldings of the main piers. The aisle ceiling is in small bays of groined wood vaulting, the ribs also worked out of the mouldings of the main piers, with carved bosses at the intersections. The inside face of walls is plastered, except where the north arcade of the nave is at present filled in with temporary walling, which is left bare. The windows are all placed at a somewhat unusual altitude from the floor, but not without good effect, as the light, admitted thus well above the heads of the congregation, is much more diffused and softer in tone than when admitted directly at the side. The floors in the passages are of red bricks laid in bold squares, and the spaces under the seats are filled in with boarding. As the mortar-setting of these passages tones down with use the pleasant old-world effect of the red bricks will be better felt. The chequered pavement of two colours of stone in the chancel contrasts well with the rest of the floor. The church is seated throughout with chairs, in accordance with the prevailing modern practice. The general outside appearance will no doubt be greatly enhanced when the stone open-worked belfry, designed to finish the small south turret, is executed; and the west elevation will be improved when the north aisle is added, to balance the existing west front of the south aisle, which questions of expenditure have as yet prohibited. The contractor is Mr. G. Foster, of Bedford.

THE NORTHERN POLYTECHNIC INSTITUTION, ISLINGTON.

The great hall, lately opened by the Lord Mayor, has seating accommodation for no less than 1,500 persons, including the gallery, where accommodation will be found for 250 persons. The orchestra, besides, will accommodate 350 choristers and instrumentalists. A perfect system of exits in case of fire has been adopted, and the improvements in regard to ventilation and heating are not overlooked. The hall is lofty, and its acoustic properties are effective. The ceiling is arched, and the hall is lighted by means of incandescent lamps, which have been fixed almost flush with the roof. As the hall will be largely devoted to the purposes of entertainment, accommodation has been provided for artistes. The floor of the building slopes upwards from the stage to the back of the auditorium, so that a view of any part the stage can be obtained. The Northern Polytechnic Institute is founded under a scheme of the City Parochial Charities Act. For building, some £25,000 subscribed (£17,500 by Cloth-workers' Company, £2,500 by other public bodies, £5,000 or £6,000 by private subscribers). For equipment, certain amount of money set apart under a scheme, and annual grants from the Technical Education Board. For maintenance, there is an annual endowment under a scheme, with grants from Technical Education Board, besides attendance and examination grants from Science and Art Department, and City and Guilds of London Institute, students' fees, and annual subscriptions. Present buildings include in the front block of three stories, offices and administrative rooms, drawing office, general class-rooms, boardroom, physical lecture theatre and laboratory, class-rooms for dressmaking, millinery, and general purposes. The rear block of three stories include engineering workshop, brickwork shop, plumbing and metal-plate shop, smithy, carpenter's shop, mechanical laboratory, engineering lecture-room, chemical lecture theatre and laboratory, and photographic rooms. To the north of the main corridor, connecting front and rear blocks, are the large hall, common-room, gymnasium, and boiler-house. To south of corridor, ground to be built on—women's department, library, refreshment-room, music-rooms, are among the buildings intended here. The hall has a separate entrance from the Holloway-road into a vestibule 24ft. square, with a panelled ceiling. On the right hand is a gentlemen's cloakroom, and on the opposite side one for ladies. The hall measures 100ft. by 55ft. The roof is of steel, elliptical shaped, and plastered with fibrous plaster, and divided into panels by ribs of the same material; each bay is 16ft. wide, and there are 27 panels to each. The panels have ornamental centres, every alternate one being arranged for electric light. The hall is lighted by circular-headed windows, supported

by stone columns, each bay containing three windows, inclosed in moulded bricks. The gallery has a separate entrance from the Holloway-road, and an emergency exit to the rear. The hall has three doorways in the front, and three on the north side as exits, leading into a corridor connecting the front with the rear, for the use of the orchestra platform. The platform is entered from the rear, and also the orchestra, which has a separate exit by the corridor before-mentioned. Under the orchestra is a retiring-room, and also other rooms for artistes, speakers, &c. Suitable lavatories are also provided. The heating is by steam, each side of the hall, and radiators in other parts, which can all be regulated at will. The ventilation is arranged so that fresh air enters the steam-heated channels from the outside, and passes warmed into the building, and is drawn away through the ceiling openings into it from the hall to exhaust-ventilators on the roof. An additional supply of fresh air is also obtained by openings the full width of the side windows, forming a sill made of iron. The architect is Mr. Charles Bell, F.R.I.B.A.; the contractors, Messrs. Macfarlane Bros., of Holloway; and the clerk of the works, Mr. W. L. Kellaway. We published in our issue of August 24, 1894, a double-page perspective and plan of Mr. Bell's design as selected in competition.

PADDOCKHURST.

The view shows a new wing which has lately been added to this house by the owner, Sir Weetman Pearson, Bart., M.P. It consists, on the ground-floor, of a new dining-room, 45ft. by 20ft., with two floors of bedrooms over a stone-vaulted winter garden, adjoining the dining-room, and, beyond, a conservatory, 90ft. long, a portion of which forms a foliache alley. The garden, terrace, fountain, &c., are being executed as shown in the view. The work has been carried out locally, without contract, Mr. S. E. Wallis acting as clerk of the works. New lodges and many other improvements are also being carried out. The gardens and houses have been entirely remodelled and rebuilt under Mr. H. E. Milner's superintendence. The architect is Mr. Aston Webb, F.S.A.

THE STACK BUILDING FOR PRINCETON UNIVERSITY, NEW JERSEY, U.S.A.

This extensive addition to this university is mainly constructed, as its name implies, for a book-store or library-buildings, attached to the old college, and grouped round a quadrangle, with "seminar" or classrooms and studies along the entrance fronts. A considerable feature is made of the tower over the main entrance, while the staircases on the return fronts afford the occasion for pleasingly-designed bays divided into two stories, the book-halls' windows rising in one height from plinth to cornice. The work architecturally is distinctly based on English types, and the building is treated with a dignified breadth and simplicity in its main lines, although some of the detail is somewhat florid in parts. As a specimen of Anglo-American building, this undertaking is of rather uncommon interest, and the architect, Mr. William A. Potter, is to be congratulated upon his design. We are indebted to the *American Architect* for the illustrations here given of his work. We regret that no particulars were furnished descriptive of the undertaking.

A new Established church is in course of erection at Brechin, N.B., from plans by Mr. J. J. Burnet, of Glasgow. It will comprise a nave, 99ft. by 24ft., and an aisle, 72ft. by 20ft. 6in., with gallery at west end, seating in all 600 persons. Adjoining are a service-hall, 46ft. by 20ft. 6in., seated for 160 persons, and a sermon-house. The buildings are faced with local grey rubble, with Cornecock stone dressings, and a prominent feature will be a square tower at the west end.

The corporation of Huddersfield have under consideration a report from the Tramways Committee, recommending various extensions of the system. These involve the continuation for 1,600yds. of the line to Paddock as far as Longwood; the continuation of the Fartown route for another 1,600yds. to Sheepbridge; the extension of the Salendine Nook line as far as Outlane; and the continuation of the tramway along Manchester-road for another 1,400 yards, until the borough boundary is reached. Work in the centre of the town comprises the making of a double line of tramways from the station to Chapel Hill, including a well-known thoroughfare comprising John William-street, New-street, and Buxton-road.

THE STACK BUILDING FOR PRINCETON UNIVERSITY, PRINCETON, N. J.
WILLIAM A. POTTER, ARCHITECT.

COURT YARD FRONT

ENTRANCE TOWER

LEGAL INTELLIGENCE.

RE SIDNEY GREENWOOD.—The first meeting of creditors was held in this case on the 2nd inst. in the London Bankruptcy Court, before Mr. H. Brougham, Official Receiver. The debtor states that about March, 1891, he commenced business on his own account, without capital, as a surveyor, at 89, London-wall. In May, 1894, he was joined by a partner; but the partnership was subsequently dissolved at the instance of the partner, who instituted proceedings in the Lord Mayor's Court. The accounts showed liabilities £578 19s. 2d., and assets nil, the debtor attributing his insolvency to the action of his late partner. He stated, in reply to the chairman, that he was now out of employment. He made no proposal, and it appeared that he had been adjudged bankrupt. The matter was left in the hands of the Official Receiver as trustee. The public examination was fixed for the 28th inst.

CHIPS.

The plans prepared by Messrs. Pugin and Pugin for the new Roman Catholic church at Coatbridge have been approved of. The cost will be £10,000.

The Talla Reservoir, which was commenced two years ago by the Edinburgh and District Trustees, will be inaugurated on the 29th inst.

The Bristol Docks Committee, at their meeting on Monday, instructed their engineer to prepare plans for such extension of dock accommodation as will provide for the reception of the largest class of vessels afloat or building.

St. Paul's Church, Birmingham, has been reopened after renovation and decoration, carried out by Messrs. Sears and Son, from plans and designs by Messrs. Gately and Parsons, architects, of Birmingham.

A Constitutional Club, Cunliffe-road, Ilkley, was opened last week. Messrs. Adkin and Critchley were the architects, and Messrs. Dean Bros. the builders. The building is of stone, and three stories in height, the lecture-hall being 36ft. by 26ft.

The parish church of Llantrithy, near Cambridge, was reopened last week, after restoration from plans by Mr. G. E. Halliday, of Cardiff. Mr. W. James, of Ffommon, was the contractor.

Colonel A. J. Hepper, D.S.O., R.E., has held a Local Government inquiry at Desborough into the district council's application to borrow £7,085 for water supply.

The St. Luke's (Middlesex) Vestry received the gratifying news on Tuesday evening that the parish is absolutely out of debt, and has £13,630 in hand. This has been brought about by the alterations in the famous Golden-lane, which has changed from a mass of poor property into an important commercial centre. The Finance Committee now proposed that the £13,630 in hand be applied to the necessary repaving in the parish. This was agreed to.

The lecture-hall of the new Presbyterian church at Wellfield-road, Cardiff, was opened on Sunday. The building at present consists of a lecture-hall and classrooms adjoining the south-east entrance to Roath Park, but space is afforded by the site for the erection of a church to hold from 800 to 1,000 persons, and it is hoped that at a very early date building operations will be commenced. The architects are Messrs. Habershon and Fawcner, Cardiff, and Messrs. Knox and Wells, Cardiff, were the contractors. The heating system is on the high-pressure pipe system, and has been fitted by Messrs. Alger and Company, of Newport. The total cost has been £2,000.

Although Mr. Sheriff-elect Dewar has denied having been goaded into action by the scathing protests by Mr. Richardson Evans published by us last week, it is satisfactory to see that he has removed the gigantic letters which disfigured the Shot Tower, seen on the southern approach to Waterloo Bridge. The name "Dewar" still appears, however, in huge white enamelled letters on every side of the parapet.

The excavations at a Roman camp recently discovered near Holzhausen, Wiesbaden, have laid open four gates with their towers. Over the north-western gate, Porta Sinistra, an inscription in honour of Caracalla of the year 213 A.D. has been deciphered. Traces of another inscription have been found on the Porta Pretoria, but it is in too fragmentary a condition to be deciphered. Numerous silver coins of Caracalla, Septimius, and Alexander Severus have come to light, and also a silver arm-ring, a leaden arm-ring, and fragments of glass vessels.

Lord Tredegar has given a site for a proposed new church for Newport, Mon., off the Risca-road, and one of the members of the St. John's Mission has promised £2,000 towards the building fund. Mr. F. J. Mitchell has promised £5,000, which is to be invested as an endowment, the revenue to be devoted to the vicar's salary.

A site has been secured on the Greenlaw estate to the west of Mansion House-road for the new Eye Infirmary at Paisley, which Provost Mackenzie has undertaken to build and equip in commemoration of Her Majesty's Diamond Jubilee. Mr. Charles Davidson, architect, has the plans in active preparation. The building is estimated to cost between £3,000 and £4,000.

A report just issued states that the London County Council, at the instance of its late Works Committee, granted compensation, in the year ending March 31 last, amounting to £880 16s. 11d., in respect of injuries sustained by workmen in the Council's employ, and to other persons for whose injuries, it was alleged, the Council was liable. This sum was equal to about $\frac{1}{2}$ per cent. of the work executed. In other cases of injury sustained by the Council's workmen, where the Council were not liable, a compassionate allowance was granted the men—usually half-pay until they were able to resume work—and the sum paid on this account reached £107 8s. 1d.

The Tending Board of Guardians have adopted revised plans by Mr. Frank Whitmore, of Chelmsford, for building a new workhouse infirmary, at an estimated outlay of £7,000.

The Local Government Board have in the main approved the plans prepared by Messrs. Worthington, architects, Manchester, for the erection of the new union hospital and infirmary at Patricroft.

At Tuesday's session of the Trades Union Congress, now assembled at Birmingham, it was resolved, on the motion of Mr. Will Thorne, London, to instruct the Parliamentary Committee to draft a Bill in favour of a legal eight-hours day in all trades and occupations in the United Kingdom. The voting was 923,000 for, and 141,000 against.

To the bishop's palace at Peterborough is being added a new wing, which will be set apart for the retainers' quarters and domestic operations.

The north-western section of the Great Northern of Ireland Railway is to be doubled. The traffic between Derry and Strabane is the heaviest on the system, and it is proposed to proceed with the doubling of that portion of the line first. The work will be undertaken immediately. It presents no difficult features, the land having been originally taken and all the bridges but one built with a view to the ultimate laying of a double line of rails. The line will be doubled the whole way to Omagh as soon as possible, and the next portion to be undertaken will be from Newtown Stewart to Omagh.

The Bishop of Peterborough on Saturday week visited Burton Latimer for the purpose of dedicating a stained window in the chancel, given by the rector and his wife. The window is the work of Messrs. Hardman and Co., of Birmingham, the cost being £600, and represents notable scenes in the life of Jesus Christ.

A window in memory of the late Rev. Arthur Henry Turnour, first vicar of St. Augustine's, Stockport, was dedicated on St. Augustine's Day. Mr. A. L. Moore, of Southampton-row, London, executed the work. The subject of the window (the east window of the morning chapel) is the Adoration of Saints, the latter being St. Jerome, St. Ambrose, St. Augustine, and St. Gregory (the four Latin fathers); St. John-the-Baptist, King David, St. Paul, and St. Barbara; in the tracery are Seraphim.

The restoration of St. Swithin's, Woodborough, Notts, the chancel of which is one of the most perfect specimens of the Early Decorated period in the county, was celebrated on the 2nd inst., when the unveiling and dedication took place of the new east window, the subjects of which are the Crucifixion, the Blessed Virgin, St. John, St. Swithin, and St. Paulinus. The artist was Mr. C. E. Kempe, of London. Since 1891, when the late vicar began the work of restoration, a sum of £2,500 has been spent on the church.

The Old Chapel at Inverewe, near Rowlands Gill, whose south wall was in danger of falling, has been repaired by order of its owner, the Earl of Strathmore. This wall contains a plate tracery window, and a segmental arch once opening into a side chamber, no traces of which, except the tie-stones, remain. Mr. M. Cheeseman, of Gilsbide, who had charge of the operations, has restored the arch, numbering each stone as it was taken down, so that each, on being replaced, was in its original position. While digging for the foundations of the pier, portions of the mullions of the east window were found.

The new church which it is proposed to dedicate to St. Catherine has just been commenced at Horwich. The whole church, including spire, will cost over £7,000, and will accommodate, when finished, 780 worshippers. Owing to want of funds, the nave and aisles only are to be built at present, at a cost of about £4,000. The plans are by Mr. F. N. Palmer, architect, and the church will be built of Ruabon brick, with stone facings.

After a restoration, involving an outlay of £1,400, St. Peter's Church, Whetstone, near Leicester, was reopened last week for public service. The work has been carried out under the supervision of Messrs. Goddard and Paget, of Leicester.

On Tuesday afternoon, in Kelloe Parish Church, in the county of Durham, a marble tablet was unveiled on the south wall by the Very Rev. Dr. Kitchin, Dean of Durham, to the memory of the great English poetess, Elizabeth Barrett Browning, who, as the register in the church records, was born at Coxhoe Hall, near by, on March 6, 1806, and baptised on Feb. 10, 1807. The memorial tablet is of white marble, framed in dark grey stone, and was sculptured by Messrs. John McMillan and Son, of Sunderland.

The parish church of Loxbeare, near Tiverton, was reopened, after a restoration extending over eleven months, by the Bishop of Crediton on the 11th ult. The work at present done comprises new floors and new seating, the thorough renovation of the Jacobean pulpit, with the replacing of the old carved pulpit canopy, the taking down of the western gallery, and the construction of a drain course around the church. A new altar-table has been provided, and special tiles have been laid down showing the resting places of those buried within the building. The work has cost £423. The work has been carried out from the plans of Mr. E. H. Harbottle, Exeter. The church has been enriched by several gifts, amongst which are a stained-glass window (by Drake, of Exeter), representing our Lord with the Apostles.

The new Seamen's institute and church at Lowestoft was opened by the Bishop of Liverpool on Friday. It consists of a hall suitable for entertainments on the ground floor, and over this a mission church.

A schoolroom is being erected at the rear of Akerman Street Chapel, Tring. It is of red brick, and consists of an assembly-hall, with gallery on three sides, and has cost £1,600. Mr. Fincher, of Tring, is the builder.

On Saturday the foundation-stone of the chancel arch column of the new Roman Catholic church at Shieldmuir, near Wishaw, was laid by Bishop Maguire. When finished, the church will have seating accommodation for 1,000. The building is designed in the Early Decorated style, and will consist of chancel, nave, side chapels, aisles, baptistry, sacristies, confessionals, &c. The internal length is 125ft., the width 58ft., and the internal height 58ft. Red sandstone is being used in the construction, and the estimated cost is £6,250, the architects being Messrs. Pugin and Pugin, London.

Col. W. R. Slacke, R.E., an inspector appointed by the Local Government Board, held an inquiry at the Corporation Offices, Chatham, on Wednesday week, as to the application of the town council to borrow £10,170 for the purposes of wood-paving in the High-street, public works, and pleasure-grounds and public street improvements at the entrance to Sun Pier, Chatham.

It is proposed to build a new church to supply the wants of the north-west ward of Scarborough, and to form a parish with a present population of 7,000 inhabitants of the artisan class. It is intended to build a brick church, which, when completed, is to hold about 600 people, exclusive of the chancel. At first, however, only part of the church will be erected—viz., the chancel, the nave, and, if possible, one aisle. These will hold about 450 people. A site has been procured in the chief thoroughfare of the district.

The Charity Commissioners have sanctioned a scheme for the development of St. Cross Hospital, Winchester, founded in 1132. Authority is given to the trustees to erect a residence for the master, outside the hospital, at a cost not exceeding £4,000, and the ancient residence close to the refectory is to be converted, at a cost of £1,500, into ten additional sets of rooms, making in all 27 residences for the Brethren of St. Cross, who consist of aged persons in reduced circumstances.

The organ at Hebron Chapel, Bedminster, which had been closed for some months in order that it might be repaired and enlarged by Messrs. Johnson, organ builders, Dighton-street, Bristol, was reopened on Friday evening.

At the last meeting of the town council of Longton, Staffs, Messrs. Wood and Hutchings, of Tunstall, the authors of the premiated design, were appointed to carry out the work of the new Sutherland Institute, which is to comprise free library and technical instruction buildings, at a cost not exceeding £8,000, exclusive of furnishing.

The Council of the London Chamber of Commerce has appointed a special committee to investigate, consider, and report upon the question of the practice of giving and receiving secret trade commissions, and the committee is to invite communications on the subject from traders, either through local chambers of commerce or direct to the secretary of the London Chamber.

THE GREAT HALL

Our Office Table.

THE autumn exhibition of the Royal Birmingham Society of Artists, which was opened to the public on Tuesday, is an unusually good display of pictures. Among the chief exhibits are Sir E. J. Poynter's "Horæ Serenæ," Sir E. Burne-Jones's "Dream of Lancelot at the Chapel of San Grael," and Holman Hunt's "May Morning: on Magdalen Tower, Oxford." "The Lonely Road," by Alfred East; Walter Langley's cottage interior, "Charity"; David Murray's "Hamstead Heath"; Val Prinsep's "Theodora: Empress and Comedian"; Melton Fisher's "Flower Makers of Clerkenwell"; and Arthur Hacker's "Great Cry in Egypt" are all works we have seen at Burlington House during the last two seasons. Among the portraits are examples of G. F. Watts (Dorothy Eleanor McCallum), F. Markham Skipworth, E. R. Taylor, and Kate Bunce; and the landscapes include works by Peter Graham, Vincent Yglesias, Douglas Adams, W. H. Bartlett, C. T. Burt, and Clayton Adams. The 250 water colours are an exceptionally fine and varied collection.

DR. W. CLAYVELL INGRAM, the Dean of Peterborough, writes, stating that the restoration of the north gable of the west front of his cathedral is now completed. Those portions of the great arch and of the gable above it which have been taken down and rebuilt contained in all 2,006 facing stones; of these 170 only were found so decayed that they had to be replaced by new ones; the remaining 1,836 have been put back again into their original positions. The scaffolding is being removed, and the completed portion of the work can now be seen. The result, he holds, fully justifies the committee in the action which they have taken. The central and southern gables, portions of which are in a very dangerous condition, will next be dealt with as the architect, Mr. J. L. Pearson, R.A., may advise; but for the completion of this work funds are urgently needed.

THE proposal to rebuild the north-west tower of Chichester Cathedral from Mr. Pearson's designs has called forth two letters of protest in the *Standard*, the objection being taken that it would conflict with the present south-west tower and the belfry tower to the north, being almost in line with those features. One of these writers says: "The glory of Chichester lies in two features—first, the Transition work of the presbytery, which is unique, and uniquely beautiful; and, secondly, the great Curvilinear south transept window, only equalled at Carlisle and York. It is not surprising that these features are somewhat overlooked, for the huge modern reredos has hidden the one, and the ugly modern glass has all but spoiled the other."

A NEW pier at Mingary, on the west coast of Scotland, was built two years ago at a cost of over £2,000, more than nine-tenths of the outlay being provided by Government. Since it has been officially passed it has been discovered that two or three sunken rocks lying in the short and narrow channel leading to it render the pier almost unapproachable. It is only on very rare occasions that steamers venture to approach it. Having regard to the heavy disbursement already made, and the smallness of the local contribution—less than £250—the Secretary for Scotland naturally declines to recommend the Treasury to make any more grants in aid of this pier; but suggests that an adequate amount should be locally subscribed for carrying out any further operations that might be necessary. A mass meeting of the inhabitants of the entire district is to be convened for the purpose of adopting some measures to raise funds for blasting away the rocks in question. It is not explained how the engineer and contractor for the pier alike failed to discover the obstructions that would render it inaccessible.

JEZREEL'S TOWER, on the summit of Chatham Hill, New Brompton, a square crenellated structure of brick and iron, 124ft. square and 100ft. in height, with a turret at each angle, was again offered for auction on Monday, by order of the executors of Alderman J. G. Naylor, of Rochester, the builder by whom it was erected for "The New and Latter House of Israel," and who, payment for materials and labour not being forthcoming from the Jezreelites, had to foreclose the mortgage. The interior above the ground floor is arranged for a circular assembly hall, capable of seating 5,000 persons, while in the space

between the square walls and the hall are numerous offices and rooms. The tower was intended to be the temple of the sect, but before it could be completed their leader died, in 1885. "Jezreel" was succeeded by his wife, who called herself "Queen Esther." She died three years later, and the community began to dwindle away. The Tower, having been roofed in, was not proceeded with, and stands, to-day, a huge shell, most substantially built of brick and iron—in the language of the catalogue, "a massive, unfinished building." A few families still remain in the settlement, to which they are much attached. About £40,000 was expended on the carcass of the Tower, which stands in seven acres of ground in the centre of a working-class district, but no advance was forthcoming at Monday's sale on £3,950, to which the bidding had slowly risen from £300, and the property was withdrawn.

AN interesting discovery of inscribed stones and coins has been made at the Roman camp of Æsica, which is situate about two miles and a half north of Haltwhistle, and where excavations have been in progress during the past two years, under the direction of a committee formed in connection with the Newcastle Society of Antiquaries. As yet we are unable to give any particulars of the inscriptions upon the two stones or altars that have been found, but doubtless these details will be published in a few days. Hitherto the fragments of inscribed stones that had been turned up had been few and unimportant. Between the west gateway and the north-west angle of the camp is an extensive range of buildings erected against the inside of the western wall. Behind a stone trough near a hearth, in one of these, which seems to have been a smithy, were unearthed about twenty silver denarii of the earlier Emperor. In an adjoining building a quantity of charred wheat was found, the grains of which still retained their shape. At the north-west angle the camp adjoins the Great Wall, extending from Tyne to Solway, and frequently described as "Hadrian's Wall." The masonry of this angle-turret and that of the wall were found to be of similar character, and bonded into each other. During the course of the excavations, large quantities of pottery were turned up, chiefly consisting of the grey smother-kiln ware. A few small fragments of the parti-coloured Durobirian ware and much of the beautiful red Saurian ware were also found. Two fragments of the latter had on them, scratched through the glaze, graffiti of names of centuries that have also been found on centurial stones in that district.

A PECULIARLY sad story was unfolded to Mr. D'Eyncourt at the North London Police-court on Monday by an applicant, who explained that he was by profession an engraver, but had had to give this up owing to defective eyesight, since which he and his wife had suffered the greatest privations. This was peculiarly hard upon his wife, who was widow of the well-known Henry Laxton, architect and civil engineer, who planned the Royal Botanic Gardens at Regent's Park, and who was the author of several standard works. At Mr. Laxton's death (his property going to a nephew, because of his dying intestate), the Architects' Benevolent Society granted her an annuity of £20, but this lapsed on her marriage with the present applicant. Mrs. Laxton invented and patented what is known as the Laxtonian ware, and had worked for many of the leading artists (Countess Gleichen, at St. James's Palace, being a patroness). However, little pecuniary good came of these inventions; so Mrs. Laxton-Clarke (her second marriage name) qualified as a trained nurse, and worked for some time in Islington. She caught fever from one of her patients, and thus was again temporarily *hors de combat*. At present they are utterly destitute. Mr. T. Holmes (the police-court missionary) said he had made inquiries into the case, and found the poor man's tale to be quite true. He also paid unlooked-for visits to his house, and found the unfortunate pair in a condition bordering on starvation. Mr. D'Eyncourt said he would give the applicant £2 from the poor-box, and Mr. Holmes, 12, Bedford-road, Tottenham, said he would be glad to receive other sums for them.

THE eighth annual report of the Asylums Committee of the London County Council has just been issued. The asylums referred to, including one in course of construction and another about to be commenced, are seven in number, situated at Banstead, Cane-hill, Claybury, Colney

Hatch, Hanwell, Bexley Heath, and Horton. The number of persons of unsound mind for whom the County of London was responsible at the commencement of the year was 13,512, an increase of 659 in twelve months. The committee remark that to provide the necessary accommodation contingent on an increase of between 600 and 700 lunatics per annum is essentially a most difficult task. They see no reason to think that there will be any appreciable diminution in this number while the population increases as at present, but the boundary line of the county may in time exercise some check as greater facilities are offered to London workers to reside out of the county. The temporary buildings at Colney Hatch and Banstead Asylums, accommodating respectively 300 females and 300 males, have been completed and occupied. The success of these buildings led the committee to ask for a grant of £30,000 for the erection of a building at Hanwell Asylum to accommodate 400 additional female patients. The council readily acceded to this request. The purchase of the Horton Manor Estate, near Epsom, comprising 1,060 acres, was also affected, the cost being £40,000. The County of London is now possessed of several eligible asylum sites on this one estate. On a portion of the ground the committee propose building a permanent asylum for 2,000 patients, and for the erection of this asylum the Council has granted a sum of £350,000. At the date of the report plans were also in preparation for temporary buildings adjoining the Horton Mansion House, to accommodate 700 females, and the Council was about to be asked to sanction the necessary expenditure for this purpose. The accommodation either provided or put in hand during the financial year, including temporary as well as permanent buildings, represented 5,700 beds.

THE syllabus of lectures in the engineering department of the City of London College, White-street, Moorfields, conducted by Professor Henry Adams, M.Inst.C.E., F.S.I., and his assistants, has just been published in readiness for the fiftieth annual session of the college, which opens on October 1st. There are now forty professors and lecturers upon the college staff, giving instruction in upwards of fifty different subjects of science, art, language, and literature, divided into 130 classes, and the attendances for the session (seven to nine months) average 70,000. The new building, erected at a cost of £16,000, contains accommodation for 4,000 students, and is situate within two minutes' walk of Moorgate-street Station and tramway terminus. To prevent the occasional overcrowding in some of the classes, an adjoining building has now been taken on lease and fitted up for art studios and additional lecture-rooms. Classes are to be held in practical sanitary science and quantity surveying, civil and mechanical engineering and valuation, technical drawing and building construction, and numerous valuable scholarships and prizes are offered. A separate class is to be held for those students who intend sitting for honours at the May examination in building construction.

THE prospectus and time-table of the Central School of Arts and Crafts, situated at 316, Regent-street, has just been issued by the Technical Education Board of the London County Council. The school was founded to provide instruction in those branches of design and manipulation which directly bear on the more artistic trades. Admission is, within certain limits, only extended to those actually in those trades, and the school makes no provision for the amateur student of drawing and painting. The instruction is adapted to the needs of those who are engaged in the different departments of building work (architects, builders, modellers and carvers, decorators, metal-workers, &c.), designers in wall-papers, textiles, furniture, workers in stained glass, bronze, lead, &c., enamellers, jewellers and gold and silver-workers, bookbinders, and embroiderers.

A TRIAL was made in the police cells in Portsmouth Dockyard on Tuesday of the Vajen Bader patent smoke protector for firemen, which consists of a helmet-shaped head covering, fitted with mica eyepieces, and supplied with fresh air from a reservoir containing 100lb. of air. In one of the police cells, which was hermetically sealed, two fires of cotton-waste, leather, and other substances calculated to emit suffocating fumes were lighted in a boggy. Among the officials who witnessed the trial were Commander Cuddy, of the Dockyard Reserve, Mr. J. A. Yates, chief

constructor, and Mr. J. T. Corner, chief engineer of the dockyard. As soon as the cell door was opened a constable wearing the helmet entered and stirred the fires, remaining in the cell for 20 minutes, when he had to be released owing to the heat. Commander Cuddy then entered, and remained for ten minutes. It was stated that the trial was a complete success, and that the helmet would be valuable in enabling men to discover the locality of a fire in the confined spaces of a ship.

THE negotiations which have been carried on for some years, in which the local authorities have urged the Crown to make a series of short roads over the Forest of Dean, have at length been brought to a successful issue. New roads, totalling about eight miles in length and costing about £8,000, are to be made in the neighbourhood of Cinderford, Blakeney, Ruardean, Lydbrook, and Littledean. Owing to local difficulties the Lydbrook and Littledean roads will be taken last. The first length of road at Cinderford has been let, and the work is already going forward. They will be district roads, and will be handed over to the Rural District Council for maintenance on their completion. The Crown have offered to make a new road from Lydney to Lydbrook, costing £8,000, if the County Council will accept the same as a main road, and this matter is now under consideration.

SOME months ago, says a correspondent of the *Lancet*, the Board of Guardians of Mitchelstown Union appointed a Mr. Lagherty clerk of the works in connection with the erection of a dispensary residence for the medical officer at Galbally at a remuneration of £1 per cent. on the necessary outlay. The guardians subsequently brought an action against him to recover £500 for negligence and non-fulfilment of his contract. This not alone failed, but resulted in the former being condemned to pay the defendant's costs—viz., £60. During the trial it moreover transpired that the defendant at the time of his appointment was 83 years of age, and was by trade a carpenter. The Local Government Board have now notified their intention to seize the workhouse in consequence of the action of the guardians, chiefly in reference to their non-payment of this bill of costs; and the position of the union is rendered critical by the fact that the guardians have been already surcharged by the auditor of the Local Government Board to the amount of £123, while further heavy surcharges in connection with the dispensary house are pending. At a specially convened meeting of the guardians, held on Aug. 28th, a resolution was passed requesting the Local Government Board to permit a cheque to be passed for the amount of the bill of costs, irrespective of other matters in dispute.

THE Right Hon. Chief Justice S. J. Way, P.C., D.C.L., Chancellor of the University of Adelaide, and Lieut.-Governor of South Australia, who left Plymouth on Saturday afternoon last for Adelaide, slipped a train on his way down from London, to visit the well-known ecclesiastical art studios of Messrs. Harry Hems and Sons, in Exeter. Chief Justice Way, one of Australia's most gifted sons, although of Devonian parentage, was born in the colonies. At an early age, however, he was sent over to England to be educated, and received his education in Exeter, and as a boy used to attend the services at the old Bible Christian Chapel in Musgrave's Alley, since destroyed. Mr. Harry Hems, at the time of demolition in 1878, for business premises, purchased the carved old oak double doors, measuring 7ft. 6in. by 5ft., by which entrance to the old building was obtained. He denuded them of whitewash, and conservatively restored the old oak. On their inner side, in small, plain characters, is incised the following:—"Double doors from the ancient High School, Musgrave's Alley, Exeter, built by Richard de Braylegh, Dean of Exeter, A.D. 1343; demolished 1878. In 1778 the Wesleyans acquired it as a chapel, and John Wesley preached there in 1779. These doors were made in 1593, and renovated by Harry Hems in 1886." The Lord Chief Justice's interest at once again meeting (in Mr. Hems's studios) the old doors so vividly photographed upon his juvenile brain, can be more readily imagined than described. Three other doors, evidently the handiwork of the same clever 16th-century craftsman in wood, still exist in Exeter. One is in the entrance to the Guildhall, another may be seen in the Close (on the western side), and the third at the entrance to Morgan's-court in St.

Sidwell's. Mr. Hems has a fret-saw in his collection, dated 1592 (said to be the oldest saw of its kind in existence), which, being undoubtedly of Exonian manufacture, it is possible was used in the actual construction of this quartette of grand historical old doors.

THE stuccoed walls of many of the older houses in the Province of Ontario, although really of wooden construction, appear like solid masonry, and have, says the *Engineering Record*, the advantages of cheapness, efficient protection from the rigorous climate, and economy in construction with common materials by ordinary labour. The ordinary siding of a frame house is furred out and lathed and plastered on the outside, the surface being coloured to suit, and thickly strewn with small pebbles set in the wet plaster. With proper repairs this surface can be maintained in a neat and attractive condition, and promotes the warmth of the house, while it saves the necessity of painting; but if allowed to become dilapidated, the appearance is very bad. The method of applying this rough-cast surface is to first cover the sheathing with two crossed layers of diagonal lath 3in. centre to centre, well nailed, and then plastered with two coats of rich lime mortar with plenty of cow's hair, mixed at least four days before using, and well pressed into the key-spaces. After it has well dried the first coat is thoroughly dampened, and the second coat applied, and the rough-cast immediately thrown on its surface. The rough-cast is composed of washed fine gravel mixed to a creamy consistency with pure lime. This is thrown on with a wooden float and immediately brushed with a whitewash brush. One hundred yards of rough-cast requires 1,800 laths, 12 bushels of lime, $1\frac{1}{2}$ barrel best cow's hair, $1\frac{1}{2}$ yard of sand, $\frac{3}{4}$ yard of gravel mixed with $\frac{1}{4}$ yard of lime putty, and 16lb. of cut lath-nails, $1\frac{1}{2}$ in. long.

CHIPS.

The Technical Education Board of the London County Council are about to appoint a head master of the new Camberwell School of Arts and Crafts, erected by Mr. J. Passmore Edwards in memory of the late Lord Leighton. Applications must be forwarded to the Chairman of the Board, 9A, St. Martin's-place, W.C., on or before Wednesday next, the 15th inst.

Messrs. Buckland and Sons, of Windsor, sold on Friday the furniture of Sandlea, Datchet, which residence has been purchased by the Crown authorities. The villa is situated upon the north bank of the Thames, opposite the Home Park, and is a picturesque feature in the river scenery. By its acquisition the Crown now controls most of the property on the Buckingham shore between the Victoria and Albert Bridges, and has to a considerable extent secured the privacy of her Majesty when driving along the Thames-side road of the Royal grounds.

Owing to the rapid growth of the parish of Willesden, it has recently been separated for poor-law purposes from the Hendon Union by order of the Local Government Board. The paupers of the parish are still, however, located at the Hendon Workhouse; but efforts are now being made by the new Willesden Board of Guardians to acquire a site near Willesden Green, and erect a workhouse there at an estimated cost of £50,000.

The Local Government Board having declined, upon second solicitation, to allow Scarborough Corporation to sell part of the Weaponness estate as a site for a proposed Wesleyan College, Mr. J. H. Moody, a member of the council, and the town clerk, have been appointed to wait upon the Local Government Board to endeavour to induce that authority to permit the sale upon the terms proposed, which are—(a) For the first ten years the purchasers to pay the corporation a rental of £5 per acre per annum; (b) from and after the expiration of that period the purchasers to pay in perpetuity a rental at the rate of £20 per acre per annum. We illustrated last week the design selected in competition for the building, by Messrs. Hall, Cooper, and Davis.

At St. Bartholomew's Hospital on Friday, Mr. Langham held an inquest respecting the death of Frederick Brown, aged 32, a carman, who was killed at the newly-erected station front at Moor-gate-street Station. According to the evidence, Messrs. Allen and Son, a firm of contractors, had sent the deceased with his cart to fetch away a load of waste bricks, and after waiting about three hours he went up the scaffold to inquire of the foreman how much longer he would have to remain. In doing this he slipped and fell, fracturing his skull. In giving evidence, the foreman said the deceased had no right to go up the scaffold. Ultimately, a verdict of accidental death was returned.

Mr. Rhind, sculptor, Torphichen-street, Edinburgh, has just completed an angel figure which is to be placed over the graves of the late Earl and Countess of Kinnoull in the old churchyard near Duppelin Castle. The winged figure, cut out of a block of Sicilian marble, is 5ft. 6in. in height. It is to stand on a rocky base, and the design of the memorial, which has been carried out under the supervision of Mr. Henry Seymour, architect, Edinburgh, includes an inclosing low balustrade of marble round the grave.

Mr. James M'Lehose, a member of the firm of M'Lehose and Sons, builders, Lanark, died on Friday from the result of an accident. On the previous Tuesday afternoon he was assisting to remove a scaffold at the top of a three-story building, when a trace swung round, and pushed him off the plank on which he was sitting. He fell to the ground among small stones and scaffolding. Mr. M'Lehose, who was about thirty years of age, was well known all over the Upper Ward of Lanarkshire.

The will and codicil of Mr. George Elkington, F.R.I.B.A., for many years surveyor to the Bermondsey Vestry, and a past master of the Coopers' Company, of Oakdene, Victoria-road, Worthing, and formerly of Briarford, Anerley, who died on July 23, have been proved by the executors, the value of the personal estate being £6,833 18s. 4d. The testator bequeaths £1,600 to his son George (who for many years has been in partnership with him), and also all his office furniture, fixtures, plant, &c.; £1,600 to his son Harold; £1,500 upon sundry trusts for his daughters, Clara, Edith, and Emily Anne; and £25 each to his executors. The residue of his property he leaves to his daughters.

The Treasury decree took effect on Friday for the sale of the "Brompton boilers," whose unsightly buildings, together with a quantity of old stores, were disposed of on that day by auction. The sale took place in front of the South Kensington Museum. The removal of the "boilers," which formerly contained the patent collections, and have latterly been used as storerooms, only accentuates the doleful aspect of the buildings from the road, and the happily small fire in a corner of the science library on Tuesday evening shows the dangers involved by the insanely reckless policy of huddling priceless works of art in combustible structures surrounded by official residences.

A chapel has been built by the Christian Brethren in Duke of York-street, Wakefield. It is of red brick with stone dressings, and is seated in pitch pine for 200 persons, the measurements being 39ft. by 26ft. Mr. H. Crutchley, of King-street, Wakefield, prepared the plans, and Mr. S. C. Denison, of Thornes-lane, was the builder. The cost was £805.

The parish council of Northfield, Worcestershire, have accepted with thanks the free gift from Mrs. Gibbins of $11\frac{1}{2}$ acres of land on the Wesley Park estate, as a recreation ground for the populous district of Selly Oak.

The Coatbridge Dean of Guild Court have passed the plans of a new Roman Catholic Church, to be erected at the corner of Buchanan-street and Dundryan-road, for St. Augustine's congregation. The church will accommodate 1,000 worshippers, and is to cost £10,000. There will be a nave, sacristy, and chancel. The building has been designed by Messrs. Pugin and Pugin, London, and will be built of Locherbridge stone.

The first section of the light railway to Benwick, which is being made by the Great Eastern Railway Co., through the Cambridgeshire Fens, was opened on Wednesday week. The new branch line begins with a junction with the main line of the G.E.R. system, at the Three Horse Shoe sidings, between Whittlesey and March, and at present is open to Burnt House, a distance of three miles. It will eventually be carried $1\frac{1}{2}$ miles further south, ending at docks on the river Nene at Benwick. The purchase of land has cost the company £4,200, and another £17,000 is being spent on construction.

Mr. F. J. Williamson, of Esher, has just executed in marble a recumbent statue of the late Bishop Harper, the first Bishop of Christchurch, New Zealand, which is to be placed in Christchurch Cathedral. The deceased prelate is represented with his pastoral staff, and wearing his episcopal robes.

An aisle and chapel are being added to the Matlock Parish Church, in commemoration of the sixtieth year of the Queen's reign. The foundation-stone of the additions, which are estimated to cost over £1,000, has just been laid by the Archdeacon of Derby.

The Earl of Crewe opened on Saturday the Liberal Club at Knottingley. The building is situated in Aire-street, opposite the Flatts. Below are two shops, while on the first floor is a reading-room, 14ft. long by 21ft. wide. On the story above this are the billiard and reading rooms, the former being 32ft. by 27ft., with accommodation for two tables. The architects were Messrs. Tennant and Bagley, of Pontefract.

Trade News.

WAGES MOVEMENTS.

THE ENGINEERING STRIKE.—The Joint Committee of the Allied Engineering Trades received on Saturday the first sum from the Amalgamated Society of Carpenters and Joiners as the result of the levy upon the members, which it is estimated will produce £560 weekly while the strike lasts. During this week a ballot is being taken of the members of a number of London trade societies as to whether a levy shall be made in favour of the engineers' strike fund. More than a dozen unions in the Metropolis have already decided in favour of supporting the engineers during the dispute.

LIVERPOOL.—A dispute has arisen between the cabinet-makers and the carpenter and joiners engaged upon the new White Star Offices, at the foot of James-street, as the result of which the latter have come out on strike. The cabinet-making contract was placed in the hands of S. J. Waring and Sons, Limited, and the employés of the firm, having been engaged for some time upon work of this character, are at present engaged in fixing it. It would seem that the dividing line between the work of the cabinet-maker and that of the joiner is difficult of definition, and in the present instance the joiners are aggrieved because they hold that the cabinet-makers have undertaken employment which does not legitimately belong to their trade. The joiners, numbering about 20, came out last Friday, and ten more of their trade withdrew at the same time from the employ of Messrs. Waring. Had the difficulty occurred earlier in the construction of the White Star offices, its effect would have been much more serious, for the operations of the carpenters and joiners have now arrived at an advanced stage, whereas formerly several hundred men were employed upon work of this class. Messrs. Waring, who employ both cabinet-makers and joiners, but are primarily dependent upon the former, are preserving a neutral attitude in the matter.

CHIPS.

Mr. Frank W. Lombard, a young architect, formerly of Boston, Mass., committed suicide at East Wilton, Me., August 24.

The preparation of the stained-glass windows which have been presented to St. Paul's Cathedral by the Duke of Westminster has been somewhat delayed by necessary structural alterations, and also by the absence of the artist, Sir W. B. Richmond, K.C.B., R.A., on the Continent. The windows are to be placed in the north and south transepts, and one of them is now complete at the works of the makers, Messrs. Powell, of the Whitefriars Glassworks. The design for the other window is finished.

The Castlecroft Congregational Sunday-school at Bury, Lancs., which was erected in 1892 (from designs of Mr. J. D. Mould, of Manchester and Bury) has just been decorated throughout by Mr. A. V. Tarpey, painter and decorator, Union-square, Bury.

Work on the main sewer from the Capitol grounds to Second-street, Washington, D.C., has just been begun by the contractors, Messrs. Murphy Bros., who have taken the contract at 300,000dol. They began with a 43ft. excavation, and will install advanced machinery for excavating and transporting the potters' clay, gravel, and red earth, which they expect chiefly to encounter in the 6,000ft. of line. Nearly the whole length of the sewer will be submerged at high tide.

The resolution of H.M. Board of Works, plus the Chancellor of the Exchequer, to proceed with Sir Edward Poynter's second mosaic in the outer lobby of the House of Commons, is gratifying news for all who are interested in the artistic adornment of our chief public buildings.

The Holywell Rural District Council have engaged Messrs. Goodison, Atkinson, and Ford, of Liverpool, to prepare water and drainage schemes for Bagillt, at a remuneration for the water scheme, 5 per cent. on the cost of the works, with a minimum outlay of £1,000; and for the sewerage scheme, making report and estimate, £25.

The plans and works committee of the Edinburgh Town Council have adopted sketch plans for a new swimming-bath for the north side, which it is proposed to erect at Saxe-Coburg-place, Glenogle-road. They are on the lines of the bath at Dalry, with modifications to suit the ground. The estimated cost is between £10,000 and £12,000.

The church of All Hallows, Kea, Truro, has now been completed by the erection of a porch, which has been opened by the Bishop of Truro. The church has cost, from first to last, over £5,000. It has been built throughout by Mr. Carkeek, of Redruth, Mr. G. H. Fellowes Prynn, of London, being the architect.

Mr. Archibald Campbell Carlyle, late of the Archaeological Survey of India, died on the 30th ult. at his residence, 25, Grafton-road, West Kensington Park, W., aged 68 years.

The S'ow Board of Guardians have adopted plans prepared for them by Mr. J. Shewell Corder, of Ipswich, for additions and alterations to the workhouse at Stowmarket, estimated to cost £2,000.

Good progress is being made with the Marlborough and Grafton Railway, and the line is expected to be opened next spring. About 2½ miles of permanent way and line have been completed, nine bridges have been built, the only tunnel nearly pierced, and the widening of the existing line between Wolfhall and Grafton is finished. Mr. R. St. George Moore is the engineer, and Messrs. Aird and Co. are the contractors.

A commencement will be made at once with the chancel of the new church of St. Ambrose, Westbourne, near Bournemouth. It will be erected from designs by Mr. C. Hodgson Fowler, F.S.A., of Durham.

The lecture-hall at Woodbridge, East Suffolk, will be reopened on Tuesday next, after having been renovated, re-roofed, and decorated. A new balcony with iron panelled front, 15ft. deep, and extending the whole width of the building, has been erected over the entrance-lobby. The erection of the balcony and other carpentry work has been satisfactorily carried out by Mr. W. I. Smith, the distemper and gas-fitting by Mr. W. Woodruffe, and the brickwork and ceiling decoration by Mr. Geo. Barrell.

Extensive additions have recently been made to the workhouse buildings at Elham, near Folkestone, from plans by Mr. John Ladd, of London.

It is understood that Mr. T. Armstrong, the director of the art division of the Science and Art Department, will retire from the service under the operation of the age regulation within the next few months. The vacancy was expected to occur next month, but Mr. Armstrong has been authorised to continue in office for a short time longer, and he will probably not leave until the preparation of the art estimates for the next financial year is completed.

Memorial bricks of a new mission-hall, in connection with St. James's Church, Bermondsey, were laid in Alexis-street, Southwark Park-road, last week. The builder is Mr. Chalkley, and the hall will be seated for 300 persons.

Mr. H. H. Law, C.E., an inspector under the Local Government Board, held an inquiry at Acomb, near Hexham, on Friday, into the proposal of the Hexham Rural District Council to borrow £950 for works of water supply in Acomb village. The proposal is to gather the water from the Salmon's Well and Silver Hill springs to the north of the village, into a storage tank on the waste land above the schoolhouse, and hence supply the whole of the village, including the terraces at the low end, from stand pipes. Mr. W. Dixon, C.E., of Newcastle, explained the scheme.

The results of the Glasgow High (evening) School Building Construction Classes have turned out very satisfactorily. All the 26 elementary and nine out of 10 advanced students who were presented, have completely passed the respective stages in the recent science and art examinations. In addition to certificates resulting therefrom, the Glasgow School Board have granted class certificates of proficiency to 26 elementary, 10 advanced, and four honours students. The opening lecture of the new session was delivered on Tuesday, the 6th inst.

In the case of Charles Samuel Proctor, of Bradford, builder and contractor, the order of discharge from bankruptcy has been suspended for three years ending August 10, 1900.

The will of Mr. James Stiff, of Suffolk House, 197, Clapham-road, and of the London Pottery, Lambeth, was proved on August 21, the value of the personal estate being £19,843.

The Halifax Town Council decided on Friday to apply to Parliament during the next session to revive the powers for the construction of the Walshaw Dean Reservoir. It was explained that the proposed source of supply will be the cheapest owned by the corporation, and it will give 2½ million gallons per day for £150,000. The corporation have already provided the roadway along which to bring the water.

A deputation which was appointed some months ago by the town council of Douglas, Isle of Man, to visit Paris, Dresden, Berlin, Brussels, and other Continental cities, and inspect the various systems of electric and other traction in use, have issued their report, which is drawn up by the town clerk of Douglas. The deputation sums up in favour of the overhead electric trolley system for the Douglas Promenade. A strong reason advanced in favour of the adoption of that system is that poles carrying overhead wires can also be used for the electric-lighting of the town.

The urban district council of Dawlish propose to seek powers, by a provisional order, to build a pier, and have resolved to obtain estimates and plans from three firms who in April last forwarded approximate estimates. The firms and estimates then were:—G. Webb and Co., Westminster, £4,750; R. J. G. Read, Westminster, £5,800; and Morgan Davies, Swansea, £6,300.

To the small permanent collection of pictures at the corporation art gallery in the mansion of Christchurch Park, Ipswich, nine additions have lately been made by donors resident in the borough. They comprise four presented by the mayor, viz.:—oil painting, Minsmere Cliff, Dunwich, by W. D. Batley; oil painting, Halstead Hall, Cumberland; water-colour drawing, Old Market Cross; ditto, Old Town Hall, Ipswich; an oil painting of Corfe Castle, painted and presented by Mr. F. G. Cotman; and the other gifts are three oil paintings—Portrait of Lord Nelson; "Birth of the Conway," by E. R. Smyth; "Meditation," by Feti; and a water-colour drawing by B. Galfiore.

The Works Committee of the Edinburgh and Leith Water Trust have adopted a report by the engineer recommending them to lay a new pipe to bring in an additional supply of three or four million gallons of water per day during the summer season from Gladhouse. The engineer stated that three million gallons per day additional for 100 days can be obtained from Gladhouse during the summer season at a cost, including way-leave, of £23,500.

The dismantled shell of St. Michael's Church, Wood-street, will be shortly demolished, and a pile of buildings, forming a branch of the London Joint Stock Bank (Limited) erected in its place. The freehold site was offered at the Mart a short time back by Messrs. Edwin Fox and Bousfield, and changed hands for £31,500 to Messrs. Davis and Emanuel, of Finsbury-circus. This firm of architects were acting as agents for the bank, and they are now preparing plans for the erection of the new edifice. The site occupies an area of 3,700 superficial feet.

The General Purposes Committee of the Leamington Corporation have rejected by a large majority a proposition that the corporation should buy the gasworks at the cost of £123,000.

A London County Council report just issued shows that a considerable profit has been made in the year ending the 31st of March last in connection with the working and maintenance of the Council's lodging-house in Parker-street, Drury-lane. The charge made here for accommodation is 6d. per bed per night, while at the commonest lodging-house for poor "dossers" a charge of at least 4d. is exacted. In the case of the Parker-street institution the arrangements made for the comfort and cleanliness of the lodgers are said to be highly appreciated.

A stained-glass window by Messrs. Ward and Hughes, of London, is to be placed in St. Guthlac's Church, Market Deeping, as a Diamond Jubilee memorial.

The East Kent magistrates granted on Saturday a provisional license for the pavilion now in course of erection at the end of the pier at Herne Bay. The pier is being lengthened and extended at a cost of over £30,000, and is expected to be finished by May 31 of next year.

The directors of the Isle of Man Tramways have obtained from the Manx Legislature power to extend their line of electric tramway from Laxey to Ramsey, and arrangements have been made to construct an extension which, when completed, will result in an electric tramway line, mainly along the sea coast, from Douglas to Ramsey, a distance of 19 miles.

The foundation-stone of the new Roman Catholic Church for Loughrea will be laid by the Bishop of Clonfert during October. The church will be built by Mr. P. Glynn, whose tender has been accepted at about £13,000.

A Jubilee drinking-fountain at the corner of Manor Farm-road and Wood Mill-lane, Swathbury, at the eastern boundary of Southampton, was formally presented to the corporation of that borough last week by the donor, Sir Samuel Montague, M.P. The fountain was designed by Mr. Percy McQuoid, and was erected by Messrs. Garret and Haysom, of East-street, Southampton.

An inquiry was held in the town hall, Gorton, near Manchester, on Tuesday week, by Colonel W. Langton Coke, M.Inst.C.E., with reference to applications by the Gorton Urban District Council for permission to borrow a sum of £10,850 for a cemetery, and £20,196 for works of private street improvement.

The foundation stones of a new Primitive Methodist Sunday School, which is in course of erection in the Hamill-road, Burslem, were laid on Monday week. The school will afford accommodation for 420 children, and is being built at a cost of £350, exclusive of the land. The contractor is Mr. John Henry Broadhurst, builder, Burslem.

CHIPS.

The Earl of Crewe is to be asked to open the Art School at Hightown, Crewe, about the middle of next month, and the sanatorium is to be opened on the same day.

At the meeting of the Spalding Urban District Council, on Wednesday week, it was decided to build a new rector house for the gasworks, at an estimated cost of £2,000. The house is to accommodate twelve rector, of which it is proposed at first to put in six, and a bathroom for the stokers is also to be provided.

On Saturday the memorial-stones of a Methodist New Connexion chapel were laid in Ombersley-road, Balsall Heath. The building is to be Gothic in style, with a main entrance from Ombersley-road, and the plan is based on the nave and aisle model, with a small gallery over the entrance lobby, and a choir gallery and organ-loft at the rear of the rostrum. The chapel will afford accommodation for 500 persons. The contractor is Mr. George Webb, of Handsworth; and the architect Mr. A. H. Goodall, of Nottingham.

A new academy, which has just been erected by the Dumfries School Board on the site of the old one, was formally opened on Friday by Sir Robert T. Reid, Q.C., M.P. The main building is of Classical design, of two storeys in height, containing, besides the ordinary class-rooms for the upper and preparatory school, a suite of four apartments for art teaching, and three for the teaching of science. In a detached block there are workrooms for technical instruction in wood and metal work, and a gymnasium. The central hall, off which all the class-rooms open, has a floor area measuring 60ft. by 45ft., and is 38ft. in height. The total cost has been about £15,000. The plans were supplied by Mr. Frank Carruthers, of Lockerbie and Dumfries, and were chosen in competition.

Bridgman, A.R.I.B.A., and Walter H. Bridgman, M.S.A., Torquay, Paignton, and Teignmouth, architects. Quantities by Mr. Vincent Cattermole Brown, of Paignton:—

For building works:—
 Goss Bros., Torquay £1,100 0 0
 Dovey, E. P., Torquay 1,044 0 0
 Webber, G., & Maunder, Paignton 933 0 0
 Hazelwood Bros., Brixham 922 0 0
 Webber, H., and Sons, Paignton* 938 0 0

For painting works:—
 Goss Bros., Torquay £78 0 0
 Webber, H., and Sons, Paignton 49 0 0
 Hookings, Brixham 46 10 0
 Perse, Brixham 42 18 10
 May, E., Brixham 30 10 0
 * Accepted, with amendments.

CARNARVON.—For painting the council chamber, for the town council:—
 Williams, W. O. (accepted)

CONGHAM.—For the restoration of St. Andrew's Church, Congham, Norfolk (first contract). Mr. Herbert J. Green, Norwich, architect and surveyor:—
 Cornish & Gaymer, North Walsham £612 4 2
 Lerner, W. J., East Dereham 507 4 6
 Boddy, J., Harpley, Swaffham* 503 0 0
 * Accepted conditionally.

CRICKLEWOOD.—For alterations to shop and premises at No. 23, The Parade, High-road, Cricklewood. Mr. John Spink, 61, Holborn Viaduct, E.C., architect:—
 Sage and Co. £516 0 0
 Neal 323 0 0
 Wheeler, E. 314 0 0
 Sumner and Co. (accepted) 295 0 0
 (Architect's estimate, £276.)

DAWLISH.—For erection of cattle shed at Longden Farm, for Mr. G. Ermen. Messrs. Norman G. Bridgman, A.R.I.B.A., and Walter H. Bridgman, M.S.A., Torquay, Paignton, and Teignmouth, architects:—
 Brickwork: Reynolds, Starcross (accepted).
 Carpentry: Blackmore, Dawlish (accepted).

EXMOUTH.—For alterations and repairs at the Criterion Inn, Exmouth, for Messrs. Ross and Pidsley, Well Park Brewery, Exeter. Messrs. Kerley and Ellis, architects:—
 Letten, H., Exmouth (accepted)

EXMOUTH.—For the rebuilding of the Railway Hotel, for Messrs. Norman and Pring, City Brewery, Exeter. Messrs. Kerley and Ellis, Exmouth and Salterton, architects:—
 Gibson, Exeter £1,400 0 0
 Skinner, Sidmouth 1,330 0 0
 Abell, Exmouth 1,325 0 0
 Hayman, Exmouth 1,237 3 0
 Perry, Exmouth 1,159 0 0
 Dart, Exmouth 1,050 0 0

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2228.

FRIDAY, SEPTEMBER 17, 1897.

INTERMEDDLING OF ARCHITECTS.

IN deciding a recent case, in which a number of architects were ranged on opposite sides, the late Mr. Justice Cave declared, "There were no such unsatisfactory men as architects"—a remark which may not go for much, except that it shows that architects are not quite so keen about professional honour and etiquette as they sometimes imagine themselves to be. "All is fair in love and war" is a maxim which holds good in matters of business as well. There are certain modes of conduct, however, which cannot be regarded in the same light—we mean the intermeddling of architects with each other's work, trying to obtain commissions by means damaging to others in the profession, and so on, and these are proceedings which cannot be excused by rules of fair competition.

Professional interferences are of many kinds. No one resents intermeddling more than the artist, for although the fine arts have been described as "non-monopolistic pleasures," those that are engaged in works of the kind are particularly jealous and exclusive, and will suffer little interference with their special craft. What would a painter or decorative artist say if his employer suggested any improvement in the composition, colour, or scheme of his work? In fact, we can hardly imagine any artistic design being produced under any restraint, or a designer carrying on his work assailed by continual prescriptions and suggestions. These interruptions to his ideas would be fatal to any success, as they would be to any literary or poetical effort. The architect, although more handicapped by commands, injunctions, and suggestions, should also refuse to compromise himself or his work. He has to put up with many of those interruptions and interferences in his ordinary daily practice. When his building is just about to be completed, some difference may arise between himself and the contractor as to the meaning of a specification clause; his certificate is disputed because a sufficient allowance has not been made for the execution of an extra. The contractor employs an outside architect or surveyor to inspect or measure his work. This kind of interference with the functions and duties of the responsible architect cannot be quietly submitted to, especially when there is an arbitration clause. To be told by an outsider that such-and-such a clause means so-and-so is really the same as being told that Mr. A. knows less of his own business than Mr. B. The dispute may be about the joists. They are specified to be of Baltic timber or red and yellow fir: the contractor has substituted, perhaps, almost as good timber of less reputable name. A's opinion is challenged by B. There are even more galling interferences. An architect prepares a design, say, for a homestead. The employer shows it to another farming friend, who finds several faults with the plan of the buildings. Alterations have to be made, or a large hotel is to be built in a provincial town. The promoters or manager desire the latest arrangements and appliances seen in the best London and Continental hotels. After much study the plans are prepared; but a member of the committee who has a friend an architect in London submits the plans to him. A new set of plans are prepared which, while incorporating all that is good in A's design, comprises several modern ideas and experiences. These plans are submitted to the

committee, who approve of them, and architect A. is instructed to revise his plans on B's model. Of course, Mr. A. highly resents B's interference; and, to say the least, it is very unprofessional. B's friends on the committee do everything to get him employed. This is no unusual instance of what happens every day. The intermeddler steps in just when the design has been completed, and the company are about to issue their prospectuses to the public. Till then he remains in the background. There are plenty of these interlopers in every profession, but the architectural calling is full of them. Every competing architect can remember the after-competition "free-booter" who comes in to gather up the spoils of his competing brethren by appropriating their ideas, and finally submitting plans which combine the good points of the premiated "first" and "second," comes in for the commission after the premiums have been awarded. The non-competing buccaneer is an "artful dodger," and knows a thing or two better than competition. Many municipal surveyors have been credited with this doubtful pre-eminence. But, after all, the man who tries to supplant another by submitting a design after the original conception has been finished, is the most offensive interloper, defying alike all considerations of professional etiquette and conduct. A few members of that august body which have their headquarters in Conduit-street have not been altogether reproachless in this respect, though as a body they hold such conduct up to deserved censure; but then, of course, we cannot blame a society for the individual delinquencies of its members. The practice of which we speak is common enough, and there may be palliating circumstances in certain cases. For example, an architect who has a good ordinary practice, a parishioner and a church-goer, is requested by the vicar to prepare a design for a new chancel and fittings. This he does according to his lights, which may not be particularly ecclesiastical or correct; in due course he submits it to his client and churchwardens. A wealthy parishioner promises to subscribe to the building fund only on the understanding that a design by an expert ecclesiastical architect is carried out, and the committee are obliged to accede to the request. They are compelled to make a clean breast of it to the original architect. His rival is consulted by the committee, and he agrees to prepare designs without inquiring whether any other plans have been accepted. The committee gets out of their arrangement with No. 1 as well as they can. His plans will not pass the requirements of the ecclesiastical authorities. A sensitive man may well feel offended on being told his design is not quite up to the recognised standard, and he may also be indignant that another architect has submitted plans. But really the second architect has not done so surreptitiously: he is unaware that anyone else has been asked to act professionally. If anyone is to blame, it is the vicar, for not having arranged with his parishioner friend conditionally, or the committee who give instructions to prepare a design through their chairman, the proceedings being entered in the minute book. Of course, the man who is superseded by another in the same work is naturally resentful. However superior the design of his rival may be, he is not readily disposed to acknowledge such superiority: he thinks rather of the disappointment and the rebuff of being supplanted by another. These interferences, unpleasant as they are, generally arise through some ill-advised appointment. Friends and committees are apt to consider that if a church, or a building of a special kind, is to be built, Mr. Brown will do as well as anybody else, without making the slightest inquiry as to his fitness or the class

of practice he is in. If they were going to a medical man they would probably be more careful. In this way we often see a specialist ousting a general practitioner, and we may point to it as a warning to those who engage architects for kinds of work they have little experience of. All this is very different to thrusting one's self into the notice of a client who has had plans prepared by another, offering to design and carry out a house at less cost, &c., which nothing but a sense of professional honour or proper etiquette would prevent. Much has yet to be done by the leading bodies of the profession to inculcate this discipline, and it is generally the more blatant and arrogant that are found the greatest transgressors in this respect. The professional touter is always most indifferent to the disciplinary rules of his own class. Perhaps the most obnoxious kind of intermeddlers are those who are ready to give evidence of the most contradictory and conflicting character in courts of law, who for a small fee are prepared to swear to almost anything on the slenderest of evidence. In this direction, too, much has yet to be done by public and professional opinion. How can a man actually say, for instance, that in precisely similar circumstances he would have done something quite contrary to avert any failure of foundation, or that Mr. Smith's charges are twice as much as they ought to be? Cases are common in which the witnesses on one side swear exactly the opposite of the other side; that some material is bad, like mortar which is approved by the other; and this sort of thing is so common that the late Mr. Justice Cave the other day, in a case decided at Nottingham, remarked: "There were no such unsatisfactory men as architects, for they were always at the opposite poles to one another." They were always contradicting one another on the simplest issues.

Intermeddling with buildings erected from the designs of others is another kind of interference which is worth attention. One of the questions put down for consideration at the recent congress at Brussels was whether it is right for an architect to finish portions of an old building that is left incomplete, and it is one that opens a large field of inquiry. For instance, Truro Cathedral was left unfinished, though it is happily now being completed by the same architect. Suppose another architect had been employed to complete the design: would it be justifiable for him to finish the fabric when its designer was still living? And scores of churches, mansions, municipal, and other buildings are in the same condition of incompleteness. Years or months elapse, and another architect is employed to carry out the design in the lifetime of the original architect. Is it professional for Mr. B. to step in and receive instructions for the completion of a building designed by Mr. A., supposing the work to be of an elaborate and highly-artistic description? We think the consentient voice of the profession would be, "No." The man who conceives the design of a building, or who begins a book or a play, should be employed to finish it. It would be unjust to him to give it to another to complete who might not have the appreciative faculty to carry it out in the same spirit. We are speaking only of designs of a special character in which the art qualities are conspicuous. If it was merely adding a bay or two to a church nave, or the lengthening of a factory or railway station, Mr. B. might do it as well as Mr. A., who was not accessible. Other questions arise. Suppose an architect is engaged to complete the design of someone else. Ought he to follow the original as closely as possible, or add something that is entirely fresh? Suppose it is the completion of, say, the Government Offices at Whitehall. For the sake of unity, the blocks should be repeated as nearly as possible, or, at least, the same

style ought to be maintained, especially if the buildings complete a great quadrangle, or front a main street. What world have been the effect if the Louvre had been completed in different styles, we can imagine; though that group of buildings shows various alterations and additions from the time of Francis I. to Napoleon III., which can be noticed in contrasting the work of Lescot with the later angle pavilion of Place Louis Napoleon by Visconti. Again, no one could complete Inigo Jones's fragment of a palace at Whitehall in any other style. But it is not always desirable to follow the original closely; it is more independent and honest to add a new portion intended for a different purpose in a style that is really modern, even if by so doing the unity of the design is weakened. But this is a large question, and there are so many governing circumstances that it is impossible to lay down a general rule as to whether an architect is justified in repeating or altering the design of his predecessor. The tradesman, too, interferes with the architect's work. Does he not introduce to the employer a chimneypiece of nondescript design, elaborately overwrought with coarse mouldings; or a new pattern electric chandelier or bracket, in a style completely at variance with the building? If the architect remonstrates, he is told by the employer that as he "has to find the money, he wishes to have his own taste gratified, or that of his wife," so the very offensive manufacturers' design finds its way into the best room of the house. The intermeddling maker of cheap fittings and furniture will sometimes frustrate the intention of the designer. Such things as cast-iron verandahs, overmantels, and the like may dispense with the architect's help entirely; the clergyman of a new church may much interfere with the architect by selecting the pattern-in-stock reading-desk, pulpit, font, and reredos from a church-furnisher's catalogue, and the so-called "art furnisher" will often use his influence to procure for himself the furnishing and decoration of a large residence. And how many persuasive arguments may be used to enlist the patronage of such men as Mr. Midas, a millionaire, who wishes to build a residence free of all trouble. The "universal provider" firm or company will undertake the design and furnishing of a complete residence in the "latest style," taking all responsibilities of contract and the trouble of selecting an architect and builder for a given sum. All personal trouble and extras are saved. To the matter-of-fact business man who does not trouble about peccadilloes of art, but wants "something up to date," this plan of agency is much more attractive than the employment of an architect: he can have exactly what he wants. The ready-built dwelling has a charm for him despite its crudeness and want of design. These are some of the influences against which the architect has to contend. His work is beset by a host of tradesmen and agents, contractors and others who endeavour to dissuade the employer from obtaining designs, or who, if they should fail, seek to interfere with his design by various pretexts: that of accomplishing the same result by cheaper means, making more display, and catering for fashion and novelty.

CLASSES AND LECTURES.

THE educational bodies are busy preparing their programmes for the coming season, and the younger members of the profession will naturally turn their attention to them after a period of touring and rest. The very natural question with the young student who has been serving his apprenticeship is "How can I obtain that amount of general and practical knowledge which is necessary for me to acquire? I have learned all an architect in practice can teach me: can draw,

trace, copy specifications, make estimates, help to take out quantities, assist in making working drawings, and have seen buildings in progress; but there are numberless things I know nothing about, except from desultory reading and hearsay." He turns to the prospectus and syllabus of one of the several colleges—like King's or the City of London College;—but probably only to find that it gives a number of courses of subjects of rather bewildering complexity, which he thinks he can learn just as well from good treatises, and for much of the rest, as the exercises in building construction, he believes he knows it all sufficiently well for ordinary business. Whether he does or not, we do not presume to say. But one thing is clear: a pupil of intelligence who has been industrious and has served his term of articleship in the office of a general practitioner, has acquired in the only way possible all the instrumental means or methods for carrying on the business. We do not say he has learned the *rationale* or the reasons for doing this or the other, or that he knows any branch theoretically; but he has learned just so much of the *modus operandi* of his craft as will enable him to carry out a building of an ordinary kind—say a house. And this is what he cannot learn so completely by attending classes, however excellent. As a matter of fact, they are theoretical and disconnected, and the practical workshop practice is of much the same character; the applications are not real, but assumed. It is one bay of a vault without reference to other parts of the structure. It is one roof-truss, or partition, but not intended for any particular building; and so of examples of masonry or joinery and iron-work. They are separate and disjointed studies—useful, but without connection with the building. What the student wants is a knowledge of principles that will enable him to apply his practical routine learned in the office to the best account, and these principles are best acquired in the college or school before he goes into the architect's or engineer's office; but if he does not learn them at this early stage, he should be taught them in the lecture or classroom which may be attended during his term of apprenticeship or afterwards. And what Mr. Deacon has said about the education of engineers is equally true of the training of architects. There is danger in the limitation of compulsory subjects in the examinations for certificates or degrees. The student is coached up in one or two subjects to the neglect of other equally important matters. We know, for example, that in some of the colleges mathematics is made one of the main subjects, and if the student is at all an adept in it, he spends the larger portion of his time on studies of this class; to the neglect of other subjects of more practical importance. We are glad to see that the City of London College provides for classes and art studios. The former include practical sanitary science, quantity surveying, civil and mechanical engineering, valuation, technical drawing, and building construction. Too much attention also is given to the copying old buildings, dates, and styles instead of trying to encourage the student to design for special purposes. Mere draughtmanship is accepted as a proof of art qualification, instead of being looked upon as the mere instrumental means. We published last week some particulars of the Central School of Arts and Crafts in Regent street, and we recommend to the notice of our younger readers the prospectus issued by the Technical Education Board of the London County Council. The instruction given by this school is mainly confined to branches of design and technical craftsmanship which bear on the artistic trades, and those who are admitted are mainly carrying on those trades. To those engaged in the building crafts, including architects, builders, and decorators,

as well as the designers in various branches, modellers, &c., the school is open, and offers decided advantages over the ordinary art and technical schools, which only cultivate the amateur element of art, drawing, painting, and manipulation, while they afford no help to the young architectural student or designer who wishes to acquire a workmanship standard instead of the mere copybook and example ideal of his art. The first school is devoted to teaching professional branches on received academical and theoretical methods, but applied to architecture and building; and the other inculcates by another and more logical process, the methods of design as applied to certain distinct objects and materials. Both have their sphere. It will be a long time, if ever, we can hope to revert to the methods of our ancestors, when art was spontaneous and growing, before the modern student will turn from his scholarship and textbook mode of learning to the methods of the old craftsmen; but we hope a large number of our leading students will avail themselves of the teaching of the School of Arts and Crafts.

Comparing the facilities now offered to the youthful apprentice and student to those which existed in the forties, we can only say the student of to-day has only himself to blame if he neglects his opportunities, which are infinitely more easy and inexpensive. The architect's pupil of fifty years ago had to acquire all the elementary and theoretical principles of his art to a large extent by personal study and reading, at least as regards the application of mathematics or science to building art. There were no art and technical schools in the provincial towns, and even the books at his command were few, inadequate, and expensive. Not that we mean to infer that these modern facilities make men better architects or artists. They cannot do this. They may even be prejudicial in some respects, by distracting the student's mind with a multiplicity of subjects and methods, and by leading him to bestow less concentrated study and attention on important branches and principles. We fear, indeed, as we here suggest, that this has been the case. "Cramming" and "coaching" have interfered with a natural order of study and intellectual digestion and assimilation. These drawbacks, however, need not be: they are only part of the price the modern student has to pay for the abundance of facilities and opportunities which an advanced age has placed within his reach. And competition is another of these drawbacks—really the cause of all that is objectionable in the methods that are now in use. Cramming has been practised to pass students who have not the time or talent to devote themselves to study; an attempt to squeeze through a man of slenderest attainments. Lectures and classes and studios are valuable means of teaching and acquiring things which no member of the profession can despise; but let them be naturally resorted to, instead of being made irksome, or a trial of mental acumen in answering a number of questions of no practical consequence.

SAINT MICHAEL'S PARISH CHURCH, SITTINGBOURNE, KENT.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS.]

FEW parish churches have survived without curtailment, which at one time seemed imminent, or possibly even total rebuilding in an unsympathetic style, an ordeal which, it will be noticed in course of this paper, this fine and thoroughly Kentish example has at various times undergone. The existing building is to be traced from a smaller Romanesque beginning, the only portions of which, however, now standing above ground are the eastern and western walls of the transepts and parts of the pier masses in its vicinity. Externally, you will not fail to observe the contrast between the admirably-dressed flint-work of the Early 14th-Century period, referred to in the "Glossary of Architecture" under

"Masonry," and the rough flint construction of the earlier builders. The original outer walls followed the lines of the present pillars and arches in the nave and Archbishop's chancel, and their foundations are occasionally exposed. The first enlargement of the earlier church took place in the 13th century, when those portions of the central chancel which include the recessed mural arcade and plain lancet windows were added. Some time afterwards the present nave and aisles and the basement of the tower, as high as the graceful western arch, were developed and completed by the early years of the 14th century. The old outer nave walls were, in this instance, thrown down gradually as the works proceeded, and not pierced with arches, as was usual in this county. The smaller church did not extend further than the west end of the present nave. The arches in the body of the church are set upon alternate round and octagonal pillars, including the responds of the chancel arch; there is no hood-moulding on the aisle side. Making allowance for a vandalism committed on the Eastern responds in the 15th century, the whole building west of the chancel arch is a well-designed composition, the work of one mind. It is illustrated in Bland's "Arches, Piers, and Buttresses," but without the deformity to be presently referred to. The Lady-chapel was erected by Simon of Chilton early in the 14th century. In the south wall of the chapel there is an elaborate Geometrical window—once of five lights, now of three only. This design, evidently by the same hand, was repeated at the west end of Brecon Priory church in harder stone, and therefore with less ornament. In the interval between the well-directed works of the 14th century and those of the next, the eastern wall of the central chancel was set a little further back, the triplet of lancets removed, and a smaller window than that still remaining in the Lady-chapel, of similar design, was inserted, which remained till 1859. Externally, beneath the modern central window, the masonry is mere rubble, and the north-east buttress was placed diagonally to resist thrust. The sacristy chapel was then no higher than the sills of the lancet-windows, which were open, or intended to be, to admit light. During the 14th century, also, the tower was increased in height from a well-marked line, and the shaftings, &c., of the first east chancel window can be seen built in on the north and south walls. The external niche in the buttress of the Lady-chapel, formed of a beautiful shelly oolite, is referred to as "St. Marie of the Boterasse." Old inhabitants remember a portion of the statuette *in situ*. Coming to the 15th century, the most important work was lengthening the old Romanesque transept towards the street, and the introduction of the grand Rectilinear window. Later on, Robert Wy Barn, bequeathed a sum of money to improve the rood-loft. It is still easy to see what was then done, although the screen and loft are left, and the stairs remain as reopened in 1872 by Mr. Payne; the eastern responds of the nave arches were on each side removed, and the arches above were rendered rampant by larger fresh voussours out to a different sweep. The blemish caused is apparent in some of the diagonal views, in one of which six arches, whole, or in part, appear. At East-church you will see the screen uninterrupted by the piers as was effected here. In order to light the "jube" thus developed, two larger windows, in the style of the time, were inserted in each nave aisle; the case of one still remains. Minor alterations, such as heightening the sacristy till its former lean-to roof was continuous with that on the north nave and Bayford aisles, also took place. At the end of the century, the tower was finished off by a battlement and a stringcourse. It had been designed to be higher. During the work, one-half of its northern wall was rebuilt in ragstone, and also a vertical half of the eastern wall. In each face so renewed, the Transition single-light openings in the ringing-room and a two-light traceried window in the bell-loft were reinserted; the north-east tower buttress was then altered from the Early English character of the rest. The inner door of the porch, the vaulting, and two little Transitional windows are of this period. In July, 1762, a great calamity happened. The whole roofing was destroyed in an hour by a plumbers' fire during a high wind, and this stately building, hitherto uninjured by fanatical violence, with all its ornaments and part of its furniture, was destroyed, and stood in ruins for over two years, in consequence of delay respecting the four chancels. The old clock was preserved. In the following December, the paro-

chial committee that had been appointed immediately after the fire, and empowered by the parishioners to "speedily rebuild and ornament the church," sent for George Dance, the celebrated architect of the day. After his visit on the 21st, he reported at the George Hotel, that, in his opinion, "the walls, pillars, and arches were strong and good, and, with little repair, fit to be built upon." The walls had been previously covered by straw—16 tons of lead being saved—and, after further delay, the nave and aisles were roofed under the direction of one John Boykett, of Milton, at a cost of £488 2s. 3½d. The nave was provided with a semicircular ceiling, and Italian cornices ran in all directions along the walls, and also into impossible places at the return ends. All the chancels, after narrow escapes from demolition, were ultimately roofed over by a pack of hedge carpenters. Archbishop Secker exercised a very helpful influence in all matters submitted to him. The large Pointed window-heads, including the great Perpendicular one, were all cut off by the ceilings, and, with the exception of this and the Geometrical example before referred to, all others within the building were deprived of their traceries, mullions of Portland stone, where necessary, being substituted. This mode of treating church windows did not even then give entire satisfaction, for, in the vestry book, I find the following question raised, "Whether the Gothic work should be removed from the east window?" All the painted glass, remarkable for its heraldry, was thrown away. Five years after the fire, the church was reopened. Nothing much, but further examples of vandalism, was done to this patched-up temple till 1844, when, at the instruction of Mr. Vallance, Mr. Willement restored the south aisle west window. This work was followed, in 1859, by another member of the same family, who presented the chancel window. Under the advice and direction of the late Mr. Slater, the second east window was then removed. The present and third design is an acknowledged mistake. It would not be difficult to effect a good restoration on 13th-century lines also of the mural arcade. In 1862 Mr. Slater restored the transepts and the large window, then in a most revolting condition. During 1868, the south-east window in the aisle was replaced by an exceedingly bad design. It is but fair to mention that Patten, of Rochester, was paid an extra sum above his contract, so dilapidated was this opening at the time (1765), and when finally removed, whole pieces of the arch had fallen out; still, it ought to have been restored. In 1873 the late Mr. R. H. Carpenter entirely re-roofed the nave, and raised it to the old mark against the tower. But, in consequence of his never having been told that the church had been burnt, he formulated his plan on Boykett's works, and reproduced the semicircular ceiling, this time tricked out in fancy-dressed Gothic versus block cornice, the whole being done at great expense. Shortly afterwards the church began to spread, and extensive centrings and shoring were promptly erected. In this way Mr. Alcock gradually reconstructed all the great piers. The restoration of the traceries has since been a gradual work.

Mr. Grant, the present warden, has been very conservative on the north aisle. The exterior of the plain chancel blocked lancets shows each to have two deep jambs divided by slightly sunk chamfers; there may have existed shaftings, as in the Roman-cemented western doorway. Traces of half-figures in frescoes are seen upon the round pillar in the north aisle, and are similar to the faces observable in old glass at the end of the 14th century. The compound pillar between the central and south chancels differs from all the rest in being built in ragstone—not fire-withstanding like those opposite. The remainder are of Ragstone firestone. The ragstone pier, not only lost one of its shaftings, but became scaled during the conflagration. The only repair at the time was effected with brick rubbish, and the work was also subjected to occasional patchings with Bath stone. Quite lately a gentleman from London has inserted a sham base to a portion of wall which was, till 1878, part of the crypt, a small portion of which was then cut off in altering the steps; further casing has also been effected. In the prosecution of these works the stability of the column has been rendered uncertain. The whole church within the past twelve months has been entirely renovated and restored at a cost of about £3,800, under the direction of Mr. W. L. Grant, architect, Sittingbourne, Kent.

C. S. F. PALMER, A.R.I.B.A.

CHURCH OF ST. MARY THE VIRGIN, OXFORD.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE Clarendon Press is to be warmly congratulated on the excellent manner in which Mr. Jackson's admirable and long-expected book has been printed and produced. The author, as might be expected, has made a worthily conspicuous addition to the University library, once more confirming his well-merited reputation as a scholar and accomplished artist. There is, however, something in this instance, quite apart from the binding and printing of the volume, quite beyond its literary matter and its accompanying illustrations, which inspires the reader with a special interest. It is the reason why the book was undertaken, and how it came about that the particular opportunity occurred which afforded so busy a worker as Mr. T. G. Jackson, R.A., a sufficient motive to engage upon so serious an enterprise. Everybody who takes an interest in such affairs well remembers, of course, about the controversy concerning the restoration of the famous spire of this notable church three or four years ago, and few will have forgotten the exceedingly unfair way in which Mr. Jackson, the architect engaged to repair the building, was treated by some so-called antiquarians in the daily newspaper press. Of course, as all were aware who had any acquaintance with Mr. Jackson or his work, the ultimate result of his plans for mending this building would amply justify the anticipations of the authorities responsible for the maintenance of the church. The detailed drawings of St. Mary's had to be made for the purpose of these repairs, and, in order that the architect might accomplish his task in every sense satisfactorily, he made researches into the history of the fabric. Thus a very extensive subject was opened up, and to those who are not intimately acquainted with the early history of Oxford, the account of the large part played by the familiar church of St. Mary the Virgin in the academic history of the city, as recorded in Mr. Jackson's pages, will place the relation of its record in quite a new light, as the story is unfolded in the brief sketch of the beginnings of the University, interwoven as it is with the history of this church. "The history of St. Mary's during the Middle Ages, is, in fact, the history of the University of Oxford. Scarcely any event of importance occurred of which it was not the scene, scarcely any movement towards the development of University life which did not originate within its walls. Here the parliament of the University met in Convocation, disputations were held, and degrees conferred. Here hung the bell which summoned the clerks to arms, when the tocsin of St. Martin's at Carfax pealed forth to rally the citizens for a fray. Hither were the mayor and burgesses forced to come in penitential guise yearly on St. Scholastica's Day to attend a solemn mass and make offerings for the souls of the clerks who had been slain on the fatal 10th of February, 1354. Here, too, was begun the formation of a public library, and, from the few parchments which were here chained to desks, or locked up in chests, has grown one of the greatest libraries of the world." In St. Mary's were housed the slender worldly goods of the University, and during the Middle Ages it was the official church of the University, its senate house, its divinity school, its library, its court-house, and its treasury. "Architecturally, St. Mary's is not unworthy of its history. In spite of frequent repairs and renovations, it still retains much of the charm of antiquity and the beauty of its Mediaeval design. The great steeple, unrivalled in its way, solid and severe below, glorious above with pinnacle, gable, and statue, is like no other: it has an individual, distinctive character that well suits the unique historical position which St. Mary's occupies."

Mr. Jackson carefully, and in a spiritedly-graphic manner, traces the doings which have been done, and the several leading incidents which occurred at Oxford during the several centuries since St. Mary's merged from the obscurity which surrounds its immediate origin. When we consider how prominently Oxford figures in the history of our Church and Constitution, it hardly needs a second thought to realise how many distinguished personages pass before the reader, as the author leads him on from scene to scene, each replete with interest, and all affording the writer opportunities for the display of impartial

* The Church of St. Mary the Virgin, Oxford. By T. G. JACKSON, R.A., Architect. Oxford: at the Clarendon Press, 1897. 33s. net.

judgment and a power of selection, qualities generally conspicuous by their absence in works of an antiquarian character such as this. Moreover, there is an absence of the merely "dry-as-dust" quality in Mr. Jackson's graceful pages, as he imparts a living force to many a forgotten event, or depicts an existing remnant of a bygone age with an artistic touch as tender as it is truthful. The plan of the church is so drawn as to display its different dates, the Lady Chapel, by Adam de Brome, and the old Congregation House, located on either side of the tower to the north of the church, and both subsequent additions to the plan. The tower thus placed at the end of a sort of short transept at the east termination of the aisle is very uncommon. A painstaking elevation by Mr. Peers illustrates its entire exterior very clearly. No clue exists as to the identity of the architect of this exquisite steeple, which stands alone in individuality of interest and grace of design, without a predecessor and with no successor. The design of the pinnacles is so unusual and complicated that, without the help of scaffolding, no correct drawing is possible, and without a plan the design is unintelligible, so that an excuse for the inaccuracy of hitherto published drawings is granted, though for the mistake made in Pugin's "Specimens," of showing the triangular, and also the oblong pinnacles as if they were square, there is no explanation. The irregularity of the angle piers is remarkable: no two are alike in width or in projection; some even overhang the buttress piers below without any apparent reason; some of the niches are half as wide again as others; some contain figures, and some were evidently never intended to do so. The statues were partly modern, made by Mr. Dunbar, a sculptor of Edinburgh, in 1850, under the direction of Messrs. J. C. and C. Buckler, the architects of the restorations, then done when about 40ft. of the upper part of the spire was rebuilt. Sir Gilbert Scott was called in to report on the dangerous condition of the spire in 1856, only three years after Mr. Buckler's work was completed. The cracks were cut out, and, by a scheme of iron rods, the structure was tied together in so admirable a way that it is difficult now to trace any of the fissures or settlements named in Scott's report. In 1861 the same architect restored the exterior so drastically as to render the work almost like a new building. Fortunately, the Classic porch was saved. The church, thus refaced and patched up with Taynton stone by Buckler and afterwards by Scott, suffered from decay to such an extent that, had they used Headington stone itself, their work could not have perished more rapidly. A quarter of a century had not passed before finials and crockets began to fall from the steeple and parapet, and the heap of fragments housed in the Congregation-house was increased by every storm. In 1889 one of the statues fell and imbedded itself in the ground close by the north door. Nearly half the finials on the steeple had fallen or were ready to drop, and not a single pinnacle on the body of the church retained its top, and so it came about that in 1891, Mr. Jackson was called in, and he has restored the building. One figure only in the niches of the spire was sound enough to be retained. Eight of the old figures were falling to pieces. Mr. George Frampton, A.R.A., was the sculptor employed for the eleven new statues now erected, and the old ones are in the Congregation-house, of which we give Mr. Jackson's interior sketch. The cost of this work of repair, so well done under Mr. Jackson's personal supervision, was £11,633 3s. 10d. The stone used was the hardest bed of the Clipsham quarries in Rutland, except the capstone and first few courses of the spire, which are of Purbeck Portland—a stone as hard as marble. The restoration of the parapets and pinnacles has yet to be completed. In the volume before us there are detailed photographic illustrations of the statues which both architect and sculptor had intended to be treated as original works, made as good as Modern Art could make them, not copying the mannerism of the old work, though preserving its general feeling, and, of course, paying due consideration to the surrounding architecture. This view was, however, overruled, and where the old figures existed the University decided that the new statues should be copied from them. Thus, therefore, in the case of nine figures, the old statues served as sculptors' models, the missing portions being modelled on them in clay, and the stone pointed from them in the usual way. The other three new figures, for which no ancient authority existed, are treated with greater freedom. Two

of these are illustrated in the book before us, viz., Walter de Merton and St. John the Baptist. The old decayed figures are also photographed. We close Mr. Jackson's monograph with the conclusion that he has performed a difficult and, in some respects a thankless, task both lovingly and well. A charmingly written book forms a fitting memorial and a valuable record of a restoration of which he has good reason to be proud. The renovation is a useful work artistically realised.

THE INSTITUTE OF AUCTIONEERS.

THE council of this Institute, which numbers close on 900 members, met the London and Provincial members at Cardiff on Thursday morning in last week, in the Town Hall, where they were welcomed by the mayor, Mr. E. Bevan, in the council chamber. There was a numerous attendance at this autumn meeting. Amongst those present were Messrs. J. F. Field, the President, George Brinsley, Frank Everill (Worcester), W. Rolland Peck, E. Dobson (Bradford), J. Hepper (Leeds), James Turnbull, A. Burnett (Southampton), C. F. Margerson (Chesterfield), A. G. Dilly (Huntingdon), W. E. Cross (Macclesfield), G. W. Fortescue (Clapham Junction), H. E. Ramsay (London), W. A. Dew (Bangor), and Charles Harris (secretary).

The mayor of Cardiff offered a hearty welcome to the members of the Institute. They would note, he trusted, the marvellous development of the great and growing town, and help them to a further growth in the future. He should ask them to look upon Cardiff as the metropolis of Wales, and as taking a place amongst the largest and finest towns of the kingdom. Their port was, he considered, not only the largest, but also the finest in the country, and, he thought, in the civilised world. Their exports of coal alone had risen in the last few years from three, four, and five millions of tons annually to sixteen millions of tons last year. They had no desire to stop this growth. Again, the population had increased from 1,018 at the beginning of the century to 170,000 at the present time. Mr. Field, the President of the Institute, thanked the mayor for his gracious welcome, and expressed the pleasure of the members at their first peep of Cardiff—the wide streets, the spacious houses, and the handsome official buildings which graced the town.

After a champagne lunch, Mr. Field took the chair as President, and Mr. Alexander introduced a deputation of auctioneers from the South Wales district, who desired to form a branch in connection with the Institute. They desired affiliation, but to be under the direction of a local council, because of the method of business peculiar to the district. Business was conducted upon a credit system, which was probably unknown in other districts. The deputation represented the whole of South Wales. Mr. T. Parry, J.P., Newport, and Mr. S. Hern, of Cardiff, supported the application. The President, in reply, expressed his gratification at receiving the deputation, and assured them that the question would receive the most careful consideration at the hands of the Council.

Following the reception by the Mayor, a meeting of the Council was held, under the presidency of Mr. Field, at which gentlemen were present from all parts of the country. The financial statement, read by Mr. Harris, showed that there was a surplus in hand, after paying off all liabilities, to the amount of £360. With regard to the library which is being formed at the London office, report was made that donations continued to be received, and that quite lately £40 had been received. A large number of new members were elected, bringing up the total to 940. A discussion ensued with regard to an increase in the number of members of the Council—from 27 to 29, and this was generally approved, while it was recommended that the new councillors should be chosen as representatives for South Wales with Monmouthshire and the Birmingham district. Finally, it was resolved that the next quarterly meeting of the Council should be held in London on Dec. 10.

In the evening the Council and members of the Institute were entertained by the local committee at a smoking concert, held at the Royal Hotel. Mr. James E. Gunn, of Cardiff, was in the chair, and in addition to those already named, the following were present:—Messrs. J. H. Townend Green (London), B. Buckell (Oxford), C. Appleton (Leeds), E. Dobson (Bradford), J. Catling (Cambridge), J. A. Taylor (Huddersfield), Douglas

Young (London), M. Morgan (Cardiff), T. Parry (Newport); and the following belonging to Cardiff:—Messrs. G. S. Giller (secretary), S. Hern, C. Clarke, C. E. Dovey, J. Thomas, S. M. Wilkinson, and H. Williams.

On Friday morning the members of the Institute, to the number of one hundred gentlemen, proceeded by special train, provided by the Barry Railway Company, to the Barry Docks. The visitors were taken round the docks in steam launches, and Mr. D. T. Alexander informed them that, whereas there were no horses employed about the docks, the number of their engines had increased from 20 to 100. After completing the round of the docks, the party were taken to Whitmore Bay, on Barry Island, thence to Dinas Powis, the residence of Mr. Alexander, in whose grounds he entertained the visitors, who afterwards proceeded to the Bute Docks and the Dowlais Works. In the evening the council and members dined together in the Lesser Park Hall under the chairmanship of Mr. James F. Field, the president of the Institute. There were 150 gentlemen present.

The Mayor of Cardiff proposed "Success to the Auctioneers' Institute." He said success in the present day could only be obtained by an institute having a good cause and great enterprise. They were justly proud in seeing such an Institute amongst them, and under such a president as they had. The Institute must progress and grow rapidly. They were banded together with one firm and determined purpose, to make their Institute a success. In numerical strength they were nearly a thousand strong, and their object was an honourable and legitimate one. He wished the Institute every success in the future. The chairman, in responding to the toast, said with regard to the profession in which they were all interested, as they had received benefits, so they desired to secure them for those who would come after them. They were not going to degenerate into a mere trades union, and to try and put every man on the same level; but they were desirous of giving every man the opportunity of developing the ability which was in him for the benefit of himself, his family, and those who employed him. These were legitimate interests which they were banded together to promote. He hoped that those present would believe that they had come to give their hearts in exchange for the hearts of those they had come to visit, and that for the future they would be banded together in one common band of friendship. The Welsh National Anthem was then sung by a native choir amid much enthusiasm. Mr. John Heppes proposed "The Trade and Commerce of Cardiff," and Mr. J. Duncan responded. The last toast was that of "Our Guests and Visitors," to which the Mayor of Oxford (Mr. W. R. Dew) and Mr. H. Forrest responded.

The very successful proceedings were brought to a close on Saturday morning by a visit to Cardiff Castle, the seat of the Marquis of Bute.

THE SANITARY CONGRESS AT LEEDS.

THE sixteenth annual congress of the Sanitary Congress is being held this week at Leeds, and is being attended by between 800 and 900 delegates from all part of the kingdom.

The proceedings were opened at noon on Tuesday, when a reception of the members was held in the Council Chamber of the Town Hall at which the Lord Mayor (Sir James Kitson, Bart., M.P.) offered a hearty welcome to the visitors. Afterwards the members attended a public luncheon at the Yorkshire College. Mr. B. Womersley (chairman of the Leeds Sanitary Committee) presided, and there was a very large attendance.

The President (Dr. Robert Farquharson, M.P.), in the course of his address, said that the work of the institute had now passed through three distinct stages. Having at first been ridiculed and afterwards opposed, it had finally come to be accepted by public opinion. Ventilators were no longer stuffed up; the working classes, no less than their employers, were beginning to be connoisseurs in the quality of their atmospheric conditions, enjoyed a good wash as much as a University graduate, and were fully prepared to appreciate the advantages of hygienic house accommodation at other people's expense; so that the institute had reached the stage of enthusiastic acceptance and universal approval, and the sanitary reformer was as much petted and caressed as he was once scouted and despised.

No properly-instructed person, in these enlightened days, would dream of taking a house without a thorough inspection of, and report upon, its sanitary arrangements; while water analysis and food analysis kept us fairly free from adulteration, and most of us knew pretty well the amount of help given us by the law in keeping our health fairly sound. Quoting from Herbert Spencer that "the first requisite of life is to be a good animal, and to be a nation of good animals is the first condition of national prosperity," Dr. Farquharson went on to protest against the monotony of much modern labour, arising from the specialisation and minute subdivision of employments. It interfered with the full and harmonious development of the bodily organs and faculties, and was hopelessly at variance with the common-sense laws of health. If they took away the stimulus of ambition and the wish to excel in any pursuit or work, so much more did the work become flat and stale, if not unprofitable; and if a man knew that by showing a superior capacity and superior zeal and energy he could not get ahead of the dull drone who worked by his side, then he became a mere machine. During the last quarter of a century, the English death-rate had been reduced from 22 to 18 per annum, by the joint labours of sanitarians in the prevention of disease, and of doctors in curing it. He quoted Professor Matthew Hay, of Aberdeen, to the effect that no great further reduction could reasonably be expected. A death-rate of only ten per 1,000 would mean that everybody born would live to be 100 years old. Probably it would be found that the natural elements of decay in men, as in all living things, which made eventually for death, independently of environment, would not permit of a lower general death-rate than about 14 to 15, even under the most favourable hygienic conditions being reasonably attainable. So that by the time we had gone as far in reducing the death-rate as we had come in the past quarter of a century, we should have reached the ultimate minimum. But it would certainly not be in another quarter of a century. After a glance at the excellent sanitary work done by the officials of the Local Government Board, under the direction successively of Sir John Simon, Sir George Buchanan, and Sir Richard Thorne-Thorne, as well as at the writings of Mr. T. Pridgin Teale and Professor W. H. Corfield, Dr. Farquharson spoke of the improvement which had been effected in the health and comfort of the members of the House of Commons by the exclusion of sewer-gas from the building some 10 or 12 years ago. This sanitary operation had been of national importance in improving the health and temper of our senators, and enhancing the quality of their work. Dr. Farquharson next sketched some of the dangers to health which seem to be inseparable from the crowding together of great populations in towns, and discussed the means by which these dangers might be diminished. Among those dangers he made special mention of diphtheria, and explained its increase, in the words of a private communication from Sir R. Thorne-Thorne, as being due to the herding of our child population in elementary schools at the very age at which they are most susceptible to the disease. The increase in diseases of the nervous system, and especially insanity, was referred to, and attributed to the increasing stress of modern life; and the most pressing sanitary questions of the day, such as the provision, wherever possible, of extra-urban dwellings for the working-classes, were briefly considered. The president entertained a very poor opinion of the House of Commons in its dealings with public health. Both sides, he declared, were bad; but that to which he belonged was the worst, for a deep-rooted suspicion of scientific methods and of progressive sanitation existed in certain Radical quarters, and abstract views of personal liberty and distrust of the so-called tyranny of doctors swayed a kind of plausible sentiment which was usually irresistible in its paralysing effects upon hygienic legislation. In such a state of feeling, a private member could do nothing until sanitary questions were taken up by the Government of the day. He looked forward to the appointment of a Minister of Public Health as the means, eventually, of obtaining for these questions the considerations which their importance demanded.

During the evening an exhibition devoted to sanitary purposes was opened in a building in Camp-road. The exhibition, which will remain open till October 9, is divided into four sections.

The first comprises appliances of a domestic character; the second includes articles of food, and also disinfectants; the third is representative of house sanitation; and the fourth is mainly occupied by heating and lighting apparatus. A lecture-hall is located at the top corner of the building, where popular demonstrations of the utility of sanitary science, made clear by the aid of a magic lantern, are given. The judges of the exhibits are: Mr. T. W. Cuttler, F.R.I.B.A., Mr. Rogers Field, Professor A. Bostock Hill, Mr. H. Law, C.E. (Newcastle), Dr. A. Newsholme, Professor J. Lane Nottle, Dr. Lewis C. Parkes, Dr. Reid, Mr. J. Osborne Smith, F.R.I.B.A., and Mr. W. C. Tyndale.

On Wednesday all the six sections of the Congress met in the Town Hall, Municipal Buildings, School Board Offices, and other public buildings.

In the section for Medical Officers of Health Dr. Edward Seaton presided, and in his opening address said that among the chief glories of the Victorian era it might be claimed that enormous advance had been made in sanitation, and yet he contended that the rural populations of England were not protected, especially in the matter of house sanitation. There was much to be accomplished, and the remedy would mainly be found in endowing representatives of wide areas with greatly-increased powers of control. In this section a paper was read by Dr. J. Brown on "Poisoning from Canned Foods," in which it was urged that in view of the number of deaths from the use of these foods, some immediate legislation was absolutely necessary. He suggested that glass should be used instead of metal for the purposes in question. The great difficulty would be, he admitted, the increased cost this substitution would necessarily involve.

The Sanitary Inspectors' Section was presided over by Mr. T. Fyfe, Chief Sanitary Inspector of Glasgow, and in his address he dealt more particularly with the ventilation of workshops and factories. He argued that at the present time there were three outstanding needs so far as sanitary inspectors were concerned. The first was systematic and high-class instruction and examinations recognised by the laws of the three kingdoms. The second, an equitable scheme of union, close and indissoluble, between every sanitary inspectors' association. The third, a legalised basis upon which every inspector might feel absolutely secure, both as to the tenure of his office and the comfort of his old age.

Major Laverock Flower, engineer to the Lea Conservancy Board, who presided at the Conference on River Pollution, said that years of experience had confirmed the opinion he held in 1876, that, if we were to have our rivers purified, the whole country should be mapped out into districts, each under a competent sanitary officer, who should have large powers under conservancy boards formed to legalise his acts. There was not a single pollution in which there was not a remedy that in many cases would benefit the manufacturers. Chemical science was sure to find some means of purifying or cleaning effluents from factories which would be effective and remunerative; and, if manufacturers ceased to discharge refuse into the sewers, the treatment of sewage at the outfall would be rendered less difficult. At present sewage, to use the words of the late Dr. Tidy, was a very complex fluid. Legislation on the subject was inefficient. He held that the remedies were mainly improved legislation, the abolition of all special clauses, and making the fouling of streams a penal offence. Much might be done by individual action; but with respect to river pollution, no half-measure should be adopted. What the country required was a firm and sound Act of Parliament conferring compulsory, and not permissive, powers upon competent men in each watershed, who, by personal influence, could induce polluters to abate their nuisance. The thing which lay at the root of the matter was waste, and he advocated that the sewage of a country should be returned to the land to produce a fresh supply of food. They should try to get rid of the sewage at a reasonable cost; but, if at a loss, still the preservation of springs, streams, and rivers from poisonous contamination was of infinitely greater importance. There was an enormous amount of waste in the discharge of trade refuse into streams; but these products might be turned to value for the good of the manufacturer, as well as for the good of the country. In conclusion, he asked, looking to the question from all points of view, and well-

nigh in despair of obtaining such an enactment as would coincide with the views of all persons interested, why should they not combine in a guild, and endeavour to bring co-operative principles to their aid? Let the members of such a league act upon the principles which had governed the Fisheries Preservation Association. He submitted that such an association was quite possible, and, if properly organised, might meet with the success which had been remarkable in other societies with different objects.

Dr. G. Sims Woodhead followed with an address on the various processes taking place in tidal estuaries which had for so long been regarded as receptacles for sewage. It was essential that these estuaries should be relieved of the sewage matter usually deposited there, and he thought that in the near future they would work hard to keep out of such estuaries all sewage matter whatever.

Mr. R. E. Middleton, in a paper on "River Pollution from an Engineer's Point of View," said no chemical treatment of sewage was sufficient to produce an effluent of satisfactory purity. All sewage matter might be efficiently treated by filtration through sand and gravel, in the same way as water was filtered, though at a slower rate and with more frequent periods of intermission. The Local Government Board were opposed to this system unless it was supplemented by an area of land sufficient to purify the sewage should the filter break down. This, although apparently a short-sighted policy, was not really so, owing to the want of care and attention in connection with many sewage-disposal works.

A novel feature in the day's proceedings was a conference of ladies upon the health work of women, at which Mrs. Fawkes, of Farnley Hall, Leeds, presided. She congratulated the many ladies present upon the official recognition they had received from public sanitary authorities. The first woman inspector was appointed by the Nottingham Corporation in 1892. Since that date, 18 others had been appointed in various localities. A resolution calling attention to the good work that had been done in Manchester and other large cities by women inspectors, and urging the desirability of one or more women being appointed in Leeds, was passed. Mrs. R. W. Eddison gave a verbal sketch of the health department of the Yorkshire Ladies' Council of Education, and Miss Ravenhill delivered an address upon "Women as Teachers of Hygiene."

Yesterday (Thursday) was devoted to the delivery of Presidents' addresses, followed by the reading of papers and discussions thereon in each of the three sections into which the work of the conference is sub-divided. Section I., "Sanitary Science and Preventive Medicine," was held in the Town Hall, and was opened by an address by Dr. T. Pridgin Teale, F.R.S. In Section II., "Engineering and Architecture," held in the adjoining Municipal Buildings, Mr. Lewis Angell, F.R.I.B.A., M.Inst.C.E., the veteran borough engineer and architect of West Ham, gave his inaugural address as president; while the president of Section III., "Chemistry, Meteorology, and Geology," Mr. William Whitaker, F.R.S., introduced the subjects to be considered in a speech delivered at the Town Hall. In the afternoon a garden party was given at Manston Hall, by invitation of the Sanitary Committee of the Leeds City Council, and in the evening a popular lecture was given to the Congress at the Albert Hall, by Mr. H. Percy Boulnois, M.Inst.C.E., the city engineer of Liverpool.

The programme for to-day (Friday) provides for the reading and discussion of papers in all three sections, and for a conference of bodies on matters of domestic hygiene. In the afternoon visits will be paid by the members to the refuse destructors, the electric tramway, the new corporation baths, and to Roundhay Park; and in the evening a lecture will be given at the Albert Hall by Dr. Philip Boobyler, medical officer of health for Nottingham.

The proceedings, which thus far have been very successfully carried out and numerously attended, will be closed to-morrow (Saturday) by visits to various works and an afternoon excursion to the new Royal Baths at Harrogate.

A NEW TRAVELLING CRADLE.

IN the repair and painting of buildings of considerable height, the ordinary suspended cradle and tackle apparatus have many disadvantages: they are cumbersome and costly, and

can be adjusted only with difficulty. Mr. Edwin Palmer, builder and decorator, and contractor for lofty cradle work, of 250, Westminster Bridge-road, has patented a travelling cradle that is much safer and simpler in its operation than the large boats or cradles used by painters. Mr. Palmer's apparatus does not interfere with the pavement; it is easily fixed and worked, being simply moved over the front of the building by the men in the cradle. We have seen the application of Mr. Palmer's travelling apparatus, which is now at work on the repainting of Southwark Bridge, and we have no hesitation in saying that it is extremely simple and easily worked. The suspended cradle or platform for the men is hung by blocks or runners of special design on a steel wire rope about $\frac{3}{4}$ in. diameter, stretched across one archway of the bridge, 216 ft. span, which will enable the painters to complete their work without further shifting the tackle, which thus saves the scaffolding, extra labour, and time employed upon it. This steel rope is tested to carry eight tons, which is ample strength for two men in the cradle. It can be easily fixed on a building with high roof by means of short poles, or cantilevers. The suspended cradle, which is easily raised or lowered by simple blocks-and-fall tackle, can be moved laterally along the steel rope by the men in the cradle. The latter is only of 6 ft. length, and much lighter than the ordinary boat. The apparatus may now be seen at work at Messrs. Clutton's, Whitehall-place, and was used at a very short notice in lighting several hundred lamps to a front on the eve of Jubilee Day, where ladders were not allowed. Mr. Palmer thus claims by his invention the principle of working by side guy-ropes, and a stretched head wire-rope. The tackle is easily adjusted to any building, and the extreme lightness of the apparatus is the main thing in its favour. The patent running-gear of this invention saves much expense, the use of travelling cranes and other appliances, and a large percentage may be saved by its use in plant and labour. We recommend it to the attention of all architects, building contractors, and the authorities of our public buildings.

AN IMPROVED MEANS FOR OPENING AND CLOSING DOORS BY ELECTRICITY.

THIS invention, which is patented by Mr. S. L. Cambie, 456, King's-road, Chelsea, relates to a new and improved means for opening and closing doors by electricity, for use in offices, flats, and warehouses, where automatic opening and closing of doors would be a great saving of time and trouble to the occupants. It is very simple, and is a great improvement on the old lever-and-chain arrangement, which was constantly getting out of order, and which required great force to operate even when worked at a short distance. Moreover, the door was only opened, there being no means for shutting it again, and, as seven out of ten will come in without thinking of closing the door after them, the house is often left in a very unprotected state. This invention provides a simple and efficient means for opening and closing doors by electricity. It consists of a bolt-releaser, motor or turning mechanism, switch, and indicator. These parts can be seen in their proper positions by looking at the illustration, where B is the bolt releaser, M the motor, C the switch, and D the indicator. The switch and indicator are placed close to one another, convenient to the apartment from which the door is required to be opened. The method of working is as follows:—The switch hand, normally in the position marked 1, is turned to position 2, whereby the current passes from the positive pole of the battery through, and operates the bolt-releaser B, the switch C, and partially the indicator D, and shunt E back again to the battery, as shown by the dotted lines. The bolt releasing is thus accomplished, and the hand of the indicator caused to point to the word "open." The hand of the switch is now turned to the position 3, whereby the current passes, as shown by the continuous lines and arrows through the motor M, spring contact-piece F, indicator, and shunt back to the battery. By this last motion of the switch, the motor is set going, and its motion is transmitted by means of the vertical rod *p* to the crank *p'*, which is rigidly connected to *p*. The crank *p'* is connected by means of its pin to one end of the rod *r*, the other end of which is hinged to the door near the lock at *r'*. The rod *r*, actuated by the crank *p'*, exercises a pulling motion on the door until

the said crank has made a half-revolution, the door being then at right angles to the position it occupies when closed. Continuing its rotation, the crank will, through *r*, effect the closing of the door. The current is then automatically shut off by means of the spring contact-piece F, and the hand of the indicator falls to the word "shut."

The motor or turning mechanism is very simple. It consists of two Siemens armatures mounted at right angles to each other on a common spindle, and they revolve between two field-magnets. Each field-magnet and armature is wound as a separate shunt machine, and the two connected in series. The bolt-releaser is also very simple. It is affixed, as shown in the illustration, to the door-post or jamb in juxtaposition to the lock. It consists of a vertical cylinder having in its periphery six equidistant vertical recesses, which are sufficiently wide enough to receive both the key-bolt and the spring bolt of the lock. It is also further provided with six equidistant ratchet teeth on its upper end, which engage with a lever suitably pawl-shaped at one end, pressed against them by a spring. The other end of the lever is provided with an armature, which is attracted by a vertical electro-magnet when the switch is turned to position 2, whereby the pawl is lifted free from teeth of the vertical cylinder, which is then free to rotate, and the spring-bolt and key-bolt, if the latter is engaged, are liberated from the notch. When the door is being closed, the bolt, or bolts, re-entering the same notch from which they have just been liberated, cause the cylinder to rotate back to its original position, where it is

firmly fixed by the pawl. The indicator is a very useful adjunct, for by its means the person operating the switch is always certain that the door is shut or open.

If a bolt-releaser is all that is required, the device B can, of course, be used by itself, and the turning device dispensed with. Nor is the indicator necessary; but as it does not add much to the expense, it is always well to use it. It is evident that by the use of this device the release of a bolt is easily accomplished, and, as the bolt glides readily into the recesses in the cylinder, no slamming of the door is necessary in order to shut it, and consequently the life of the lock is considerably lengthened.

IRON AND STEEL TANKS.

WE have received a revised and illustrated list of Messrs. Burney and Co., of the Iron and Steel Tank and Barrow Works, West-ferry-road, Millwall, London, E. The list contains the net prices and sizes of galvanised iron cisterns, tanks, cylinders, cattle troughs, corn bins, &c. Messrs. Burney and Co. keep a large stock of cisterns and tanks, and of suitable plates, &c., for other goods, and all these are tested before delivery. Several sizes of galvanised iron open-top cold-water cisterns are given which tabulate the dimensions, thickness of plate, gallons, &c., enabling a builder to select the size of cistern and price. Loose covers with handles are priced at 9d. for $\frac{1}{2}$ plate, and for different gauges. The gauges most in demand are 16-gauge 20 to 80 gallons, 14-gauge 100 to 300

gallons, 12-gauge 350 to 400 gallons. These cisterns are made with angle iron and corner plates at top inside. We have also here galvanized iron close-top hot-water tanks, iron and steel circulating cylindrical tanks, with side man-hole or riveted top only. These tanks are made to hold from 20 to 100 gallons. The list contains welded wrought-iron tubes and fittings for gas and water of various diameters and prices, galvanized or painted iron water-cart tanks, ships' tanks, &c. The galvanized wrought-iron mangers and troughs of various shapes, the wrought-iron hay-racks and corn-bins, sanitary dust-bins, are worth the attention of all builders of stables and sanitary authorities. Cast-iron goods, gutters, soil-pipes and connections, covers and frames, a large assortment of plumbers' brass-work, and of patent steel barrows for various purposes, boilers of special types, iron wire netting, and other iron goods are illustrated. The prices are fully given in every case, and the list will be found a useful addition to the office of the architect and engineer.

HYDRAULIC CEMENTS.

THE value of the admixture of puzzolanas with Portland cement for hydraulic masonry has been generally admitted. On old writer on limes and cements, Mr. Higgins, refers to the value of the mixture of these deposits. A paper read before the American Society of Civil Engineers by Mr. Andreas Lundteigen points out the discovery in Nebraska, Colorado, and other localities, of large deposits of this earth. A discussion on the paper showed that there were some who disapproved of the mixture. It has been strongly advocated, however, by others, notably Dr. Wilhelm Michaelis, of Berlin, whose paper on the "Hardening of Hydraulic Cements containing Lime" read at Stockholm explains the chemical action. He observes that the silicic acid is the most essential component of the hydraulic mortars; the more so, the richer they are in hydraulic silica, or the hardening properties under water. Hence, he observes, there is no better puzzolana than the hydraulic silica itself, which has been condensed by strong heating, or opal and Santarin earth among the natural puzzolanas, which are richer in active silicic acid than trass; for the richer these mortars are in hydraulic silica, the more quickly do they swell under the influence of the lime, and the more closed become their joints. He also alluded to the excellent effect of Santarin earth mortar in withstanding the action of sea water, and shows that the manner of setting of hydraulic mortars explains their unfavourable behaviour in the air. The hydration and swelling of the hydraulic factors cause, under these conditions, their decomposition in the air, where the hydrates of silica and alumina lose the water of hydration. "Hence the knowledge that the hydraulic mortars are the less resisting in the air, the more water used in them, and of the diminution of the swelling by using the minimum quantity of water, by compacting during use, and by adopting the densest possible mortar, is of great importance. In works in sea water, particularly in the use of hydraulic mortar in sea water, the main protection lies in closing the pores and fixing the lime. Both are accomplished in a pre-eminent manner by the addition of hydraulic silica capable of much swelling, for this silica fixes the lime on the one hand and closes the pores to the highest degree on the other hand. The mixture of Portland cement with active puzzolanas gives, therefore, the best and cheapest mortar ingredient for maritime works."

The Hereford County Jubilee memorial, a full-length portrait of the Queen, copied from Angeli's Jubilee painting, was unveiled in the Shire Hall, Hereford, on Wednesday. Mr. R. B. Paul was the artist, and the cost was borne by public subscription.

At the Lewes County-court, on Tuesday, before his Honour Judge Martineau, Stephen Myles, formerly a builder, of Seaford, applied for his discharge. His Honour commented on the fact that debtor had paid no dividends, had kept no books, and knew he was insolvent. Ultimately his Honour suspended the discharge for four years.

The Secretary of the Admiralty states that there is no truth in the statements which have been current that the Board of Admiralty had abandoned the plan of building a Naval College at Dartmouth on the site already selected. On the contrary, the necessary action is being taken for the immediate acquisition of the land, with a view to commencing the building of the college.

OBITUARY.

THE death has taken place at Chelsea, after a very short illness, of Mr. J. MILO GRIFFITH, the Welsh sculptor. When a boy in Pembroke-shire he commenced carving heads in stone under difficulties, for his father, a stern Calvinist, broke one of them, saying he would have no carved images in his house. With his mother's cognisance, he worked, however, in an outhouse, and afterwards obtained such technical instruction as was available. He first came to the fore at the restoration of Llandaff Cathedral, where he carved many of the stone capitals; but it was in 1870 that, at an industrial exhibition, his work attracted attention, and he presented several specimens of his carving to the Cardiff Free Library. His statues of John Batchelor at Cardiff and of Sir Hugh Owen at Carnarvon increased his reputation, and the Royal Cambrian Academy subsequently employed him. In 1883 he commenced exhibiting at the Royal Academy, and ten years later he sent in six pieces, and eight to the Walker Art Gallery at Liverpool. One of his Academy pieces, "The Flower Girl," was bought by Mr. C. R. M. Talbot, the then Father of the House of Commons. In 1883 he designed the silver shield given to the Prince and Princess of Wales from South Wales, and later he went over to the Chicago Exhibition, and was for some time professor of art in a college at San Francisco. One of his most successful works was a statue of St. Brelia in marble, and he was the inventor of the Helix button. His last work was a design for the proposed national memorial to Llewellyn ap Gruffydd, which he sent for exhibition to the recent National Eisteddfod at Newport.

MR. WILLIAM GALLOWAY, who has been employed for the last twelve or thirteen years in excavating the foundations of the old cathedral at Whithorn, died on Saturday evening, after a short illness. Mr. Galloway, who was about sixty-five year of age, was born in Edinburgh, was educated at the High School, and afterwards apprenticed to Mr. Patrick Wilson, architect, Queen-street, Edinburgh. He early took to painting, and has executed some paintings which were considerably admired. He turned his mind early to ecclesiastical architecture, and few men were better acquainted with the details of the successive styles of ecclesiastical buildings. But old monuments of all kinds had a strong attraction for him, and his skill in deciphering characters characters on ancient stones was very great and exact. He was well versed in several languages, including Hebrew and Greek. Mr. Galloway was poet of some note, one of his best known works being "Twa Auld Whinstanes," and he was an author of several volumes, amongst which are "The Battle of Drowell," and "Augustine's City of God."

THE meeting of the Dublin Master Builders' Association, convened to be held on Friday last week at the Grosvenor Hotel in that city, was adjourned out of respect to the memory of Mr. SAMUEL H. BOLTON, J.P., and a vote of condolence was passed to the family expressing regret at the death of "a much-respected and prominent member of the association since its inception, and one so honourably connected with the building trade of Dublin for many years."

CHIPS.

An organ, built by Messrs. Blackett and Howden, of Newcastle, was opened on Friday at the Primitive Methodist church in Durham-road, Gateshead.

The interior of the large chapel at New Hall Convent, at Chelmsford, has just undergone renovation. The work has been carried out by Messrs. W. Bishop and Co., of Duke-street, Grosvenor-square, under the personal superintendence of Mr. Edwards, of that firm.

The Victoria Gardens at Chatham were publicly opened by the Mayoress on Wednesday, in commemoration of the Diamond Jubilee, the Corporation having converted a portion of Fort Pitt Fields into a pleasure ground, under an agreement with the War Department.

The admirers of the late H. H. Richardson's greatest work, Trinity Church, Boston, will be sorry to hear that plans have been made for building a ten-story apartment-house just across the street from the church, the appearance of which cannot but be greatly injured by the new structure. Presuming that the apartment-house will be carried to the maximum height permitted by law in Boston, 125ft., its cornice will rise higher than the stonework of the central tower of the church.

COMPETITIONS.

CARDIFF TOWN HALL.—In this important competition between 70 and 80 architects have already applied for particulars, including several Swedish and German architects, and there promises to be a keen contest. It will be remembered that Mr. Alfred Waterhouse, R.A., has consented to act as assessor, and that the premiums offered are £500, £300, and £200. The time allowed for preparing designs is unusually short, the latest day for sending in being December 4th.

DARLINGTON.—The streets committee of the town council have examined the plans received in answer to the advertisement for competitive designs for the proposed improvement of the High-row. It has been arranged to exhibit the same in the council-chamber for inspection, and their further consideration has been adjourned.

DESIGNS FOR FURNITURE.—The council of the Society of Arts hold a sum of £400, the balance of the subscriptions to the Owen Jones Memorial Fund, presented to them by the memorial committee on condition of their spending the interest thereof in prizes to "students of the schools of art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes will be awarded on the results of the annual competition of the Science and Art Department. Competing designs must be marked "In Competition for the Owen Jones Prizes." No candidate who has gained one of the above prizes can again take part in the competition. The next award will be made in 1893, when six prizes are offered for competition, each prize to consist of a bound copy of Owen Jones's "Principles of Design" and the Society's Bronze Medal.

HALIFAX.—At the last meeting of the town council the mayor proposed that the council adopt the plans for the police station and county court, submitted under the motto "Victorona," with alterations as suggested by the sub-committee; that Messrs. George Buckley and Son, Halifax, the authors of the plans, be instructed to prepare working drawings, specifications, and bills of quantities, and obtain tenders for carrying out the various works required in connection with the erection of a police-station and court-house, at an estimated cost of £11,600, the buildings to be on the old infirmary site. The old infirmary buildings would be entirely swept away, and thus they would be able to widen Harrison-road. It was also proposed to have a large open area, and a covered drill-ground. The prisoners and police would enter from Carlton-street, the public from Ferguson-street, and the magistrates from Blackwall. Alderman Hodgson moved as an amendment that it be a recommendation to the council to have alternative plans prepared, and to obtain tenders for the various works necessary at an estimated cost of £9,000. Mr. Bottomley, who seconded the amendment, declared it would be a great waste of public money if the old infirmary was pulled down. Mr. J. T. Simpson said that instead of being one of the best buildings in the town, the old infirmary, he considered, was one of the worst. There voted for the resolution 29, and 14 against, and, therefore, the plans for the new scheme were adopted. The premiums in this competition were awarded some time since to designs sent in under the mottoes "Diamond Jubilee," "V.R.," and "Municipal"; but the council decided not to carry out any one of those designs.

LLANFAIR COUNTY SCHOOL.—At the last meeting of the Montgomeryshire County School Committee, a communication was read from the clerk of the Llanfair Governing Body, asking that a sub-committee be appointed to consider further plans for a new school at Llanfair. Mr. Watkins, one of the members, stated that the Llanfair Governors had been placed in an inconvenient and unpleasant position. Some time ago the Llanfair Governors advertised for plans for the erection of the school, the advertisement plainly stating that the schools were not to cost more than £900. Mr. Shayler's plans were accepted, but the lowest tender sent in for the erection of the school according to the plans was nearly £600 in excess of the amount stated. The governors had made an application to the Charity Commissioners for permission to secure new plans, and the application had been granted. The Llanfair Governors now asked the county authority to appoint a committee to consider the new plans and pass them if they were suitable, so that there

need be no delay. The committee was duly appointed, and given power to act.

METROPOLITAN ASYLUMS BOARD OFFICES.—The managers of the Metropolitan Asylums District received, on Saturday, an order authorising the managers to purchase from the Corporation land on the Victoria Embankment at the corner of Carmelite-street as a site for new offices, at a sum not exceeding £53,000. Authority was given for the borrowing of the amount with a sum not exceeding £250 to cover expenses connected with the purchase. The chairman moved that the question should be referred to the Works Committee in order that the members might submit the name of an architect to prepare plans of the new building. No further delay, he said, ought to take place. Mr. Wells moved as an amendment, that the Works Committee should bring up the names of not less than three architects, who should be asked to prepare plans for the proposed offices. After some discussion the amendment was carried by a small majority, and adopted as a substantive motion.

WOLVERHAMPTON.—The Free Library Subcommittee of the town council were informed on Tuesday that the majority of the invited architects had consented to send in designs for the new building, and it was decided not to increase the number of competitors by throwing the competition open. The time for sending in the designs was, however, extended from the 14th to the 28th October.

CHIPS.

Mr. G. Barnes has been informed by the secretary of the Amalgamated Carpenters' and Joiners' Society that as a result of the ballot recently taken among the members of his society, it had been resolved by a large majority to make a general levy of 3d. per member during the continuance of the engineering dispute. This will bring an addition of about £600 per week to the strike pay fund.

A parish institute is about to be erected close to the church which was built a few years since at Kingstown, Portsea, from Sir A. W. Blomfield's designs. Towards the cost of the church the late Mr. W. H. Smith contributed upwards of forty thousand pounds, and Lady Esther Smith has accepted an invitation to lay the corner-stone of the new building on the 12th of October.

The new line from Stert to Westbury has so far progressed that the contractors have now laid their surface line for the whole of the distance, and have established a connection between Stert and Westbury. The making of the permanent way is being pushed on, and the stations and bridges are being erected.

The Streets and Buildings Committee of the town council of Edinburgh have made arrangements for a considerable development of the wood-paving scheme in the city. A commencement has been made this week with South Bridge-street, which is to be laid with wood between the Tron Church and the University. When this work is finished, Earl Grey-street will be dealt with in like manner, as also that portion of the north side of Princes-street not already paved with wood, extending from the south-west corner of South St. David-street to the Register House. Australian wood—jarrah and karra—will be used by way of experiment.

The directors of the North-Eastern Railway are about to carry out an extensive scheme of improvement in their main line. This will consist of widening the line between Tollerton and Shipton, near York; and between Thirsk and Otterington, near Northallerton. The tenders for these important and costly works will be required to be given in at the end of this month.

The Blackpool Town Council decided on Tuesday upon another important step for the improvement of the town, being in connection with the enlargement of the open fruit and fish market. The resolution was to the effect that the town clerk should seek, by an Improvement Bill to be introduced in Parliament next session, compulsory powers for the acquisition of property running along Market-street, Upper West Euston-street, and Lytham-street. This includes two hotels and a number of large business establishments, all of which are to be demolished in order to throw open the market.

Lieut.-Col. A. C. Smith, R.E., Local Government Board Inspector, held an inquiry at Rugby on Friday, with reference to the application of the urban district council for sanction to borrow £11,500, being £8,470 for the purchase of 80 acres of land in the parishes of Bilton and Newbold for sewage disposal purposes, £2,700 for works of water supply, and £330 for purposes of street improvements.

Building Intelligence.

DUDLEY.—The town council gave their formal sanction on Tuesday to the proposal to construct a new theatre and arcades in the Birmingham-road by passing plans which have been prepared by Mr. A. Ramsell, architect, Dudley, subject to certain improvements to the structural arrangements. The site is close to the railway station and the termini of four tramway systems. The building to be known as the Opera House, which will be 150ft. wide at the front, will occupy the centre of the site, and be set back from the foot-path 15ft. The cost of the undertaking is estimated at between £8,000 and £10,000. The building will be 53ft. in height from the floor level to the parapet. On each side of the central portico will be three smaller entrances, next to which will be the arcades, each of the latter being flanked by a shop. Shops will be constructed throughout the whole length of the arcades, which will extend round the theatre, forming a continuous covered promenade. The theatre will accommodate about 2,000 people. The stage will measure 36ft. by 60ft. There will also be a large rehearsal room, 36ft. by 25ft., and on the left of the grand staircase a lounge will be provided for the dress-circle visitors. The building will be heated with hot-water pipes and coils, and hydrants will be provided on each floor for the extinction of fire.

EDGBASTON.—On Monday the Misses Stokes laid the foundation-stone of the new church of St. Ambrose, Pershore-road, which is to replace a temporary church. The site, at the corner of Pershore and Raglan roads, has been given by Lord Calthorpe, and upon this is to be erected a building which will cost between £6,000 and £7,000. The designs, prepared by Mr. J. A. Chatwin, architect, of Birmingham, show a church of red brick, with terracotta dressings upon the outside, and Bath-stone dressings in the interior. The building will consist of a nave 90ft. long, with a chancel 36ft. long; north and south aisles, shallow north and south transepts, a choir vestry, with organ chamber over, clergy vestry, and an apsidal projection at the west end forming a baptistery. There is also to be a tower and spire at the north-west corner, and a south porch; but only a portion of the tower will be erected in the first instance. The spire, when completed, is also intended to be of terracotta, and will rise to a height of about 150ft. The architectural style is Gothic, with Flamboyant tracery to the windows. The floor of the church under the seats will be of wood, while the passages will be paved with Ruabon quarries. The church will accommodate 708 adults. The walls will be faced with bricks. Messrs. Collins and Godfrey, of Tewkesbury, are the builders.

GLASGOW.—The new art galleries now in course of erection on the southern fringe of the Kelvingrove Park, of which the Duke of York laid the memorial stone on Friday, are being built from the plans of Messrs. J. W. Simpson and Milner Allen, architects, London, which were selected in competition, and were illustrated by us as far back as our issue of April 15 and 22, 1892. The cost of the building designed by them fell not far short of £200,000, the contract price for the mason work alone amounting to £120,000, and the expectation now is that the building when completed will cost close upon a quarter of a million sterling. Some four years ago the first sod of the new galleries' foundation was cut, but as the work progressed the Exhibition Association began to feel the financial burden of the undertaking too severe a strain, when the corporation stepped in, and consented to complete the buildings. The buildings cover an area of about two acres. The galleries run east and west parallel with Sandyford-street, and the principal elevation fronts the park, viz., the north. The length of the building will be 400ft. and the depth 200ft. Including the basement story, in which the school of art will be quartered, the block will have three stories. Both at the main entrance in the north side and the Sandyford-street entrance there will be spacious vestibules, and from these there will be easy access into the central hall or into the galleries, which are to go all round the building on the two principal flats. On either side of the central hall there is to be a large court, and an arcaded gallery or balcony and promenade will go round the hall. The great hall is to be absolutely central, being planned on the bisecting lines of the site from north to south and

east to west. Two hydraulic lifts will rise to the various galleries. The refreshment department will occupy a central position, and, while quite distinct from the museums and galleries, will be accessible from any part thereof. The buildings are to be fireproof throughout, and there will be a system of combined heating and ventilation, fresh air being introduced in basement ducts, warmed over batteries of steam pipes, and injected by means of a fan into the various galleries and rooms, downward extraction being provided for the vitiated air, which will pass away by the main extraction shaft. The buildings are being constructed of brick, the exterior being built of red sandstone from the Lochbarbriggs Quarries, near Dumfries, while some parts of the interior are being faced with white Giffnock stone. The exterior of the building is being treated as an astylar composition on severely Classical lines, but with Free Renaissance for details. Regarding the different apartments, it may be stated that the central hall will cover an area of from 10,000 to 12,000 square feet. There will be six galleries for art exhibits, two of them 94ft. 7in. by 25ft., and the remainder 93ft. by 28ft.; four pavilion galleries of 35ft. square, and four cabinet galleries 14ft. square. As to the museum, the east and west courts will be identical in size—105ft. by 64ft. The west gallery and the east gallery will be 94ft. 6in. by 37ft., and the other galleries, four in number, will be 93ft. by 28ft. There will be four pavilions of 35ft. square, and galleries will run round the east and west courts. In the school of art the elementary room will be 72ft. 6in. by 36ft.; the designing room, 35ft. by 20ft.; the antique room, 54ft. 6in. by 36ft.; the painting room, 36ft. by 36ft.; and the modelling room and clay store, 35ft. by 20ft. Masters' rooms and cloak-rooms are also included. Provision is likewise made for four offices, a library, a house of five rooms and kitchen for the resident attendant, manager's room, service rooms, larders, store rooms, sculleries, and pantries. The outer walls of the building vary in thickness from 3ft. to 4ft.

MAIDSTONE.—The ceremony of consecrating the new parish church of St. Luke, which is situate at the north end of Maidstone, was performed on Friday by the Rev. Dr. Eden, Bishop of Dover. The extreme length of the building is 121ft., width 58ft., and height 38ft. From the central beam the roof, which is of pitch-pine and tiled, slopes down on either side to the walls, which are about 10ft. high. In the design the architect has sought to embody the principle that every building, while exhibiting a knowledge of that which has preceded it, should not be merely a collection of archaeological features tastefully combined, but that every part should indicate thought as to its purpose, construction, and artistic effect, and that the whole should at the same time possess unity and consistency. The new church, therefore, although Gothic in general character, lays no claim to be called Early English, Decorated, or Perpendicular. Neither can it be said to be a combination of these arbitrary distinctions of style. The design of many features is novel, such as the coupled shafts and bold segmental arches and mouldings of the nave arcade, the capitals of the chancel arch, the treatment of the east window of the chancel, and the west doorways. The fittings of the choir, including the seats for clergy and lectern, exhibit the same independence of treatment. The suppression of the customary clerestory, for the sake of insuring good acoustic results and preventing down draughts in the nave, has produced a low roof and its unbroken line from ridge to aisle walls. On the north side a small hexagonal tower, surmounted by a dove of beaten copper, has been erected, to serve as a bell turret, and forms one of the chief features of the exterior. All the doors open outwards on rollers. The west window, which is of an oriel pattern, has been made very large, to afford better lighting facilities, and immediately underneath it the baptistery projects out of the main building. The church seats 600 persons, although the pews, which are of Oregon pine, are only built to hold a congregation of 479. There are no stained-glass windows, though all the glass is tinted. Twin pillars of stone support the roof, and a feature of the building is the carving which has been executed in the stonework. In the arches of the nave are bosses of Scriptural animals and flowers. The church is heated by hot water, and lighted by incandescent gas-burners. Local ragstone has been used for the external facings, the windows, weatherings, copings, and some other

dressings. All the internal stonework, too, is of Monks Park stone. The roof is covered with Broseley tiles, and the bell turret with oak shingles. Messrs. Wallis and Sons, Maidstone, were the contractors. Mr. Ireson acted as clerk of the works. The whole, including the fittings, and furniture, was designed by the architect, Mr. W. Howard Seth-Smith, of London.

PAYHEMBURY.—The parish church, which has been closed for two years, was reopened on Friday, after having undergone renovation. The tower has been improved by the removal of the decayed stones, and the substitution of new material. A new clock has been fixed. The seats in the middle of the church have been repaired, and new ones are provided in the aisles. The roof has been treated with carving, and at the back of the altar there are three stained-glass windows. A memorial lectern is about to be placed in the church. The contractors for the work were Messrs. Northcott, of Ashwater, and Mr. Luxton, of Bridgwater. The architect was Mr. G. H. Fellowes-Prynn, of London.

ST. CLEMENT DANES.—A meeting of ratepayers, convened by requisition of the rector and churchwardens of the parish of St. Clement Danes, was held on Wednesday night under the presidency of the rector, the Rev. Septimus Pennington, who stated that this historic church would soon be in the hands of the restorer as a result of the Queen's Diamond Jubilee. The stands erected around the fabric in June last realised £5,750, and, legally, he was entitled to the whole of that sum. He had decided, however, to give the amount for the purposes of the complete restoration of both the exterior and interior of the church. The scheme of restoration and improvement included the repairing and redecoration of the interior, introducing an electric-light installation, repairing and restoring the organ, restoring the altar (which, now covered with stained wood, was found to be composed of costly carved marble), and the restoring of a chest in which the deeds of the church were deposited hundreds of years ago.

TYNEMOUTH.—The chairman of the Tynemouth School Board placed in position on Saturday a medalion of Her Majesty in the new building which is to be known as the Queen Victoria School. The school, which is being erected from the designs of Messrs. Marshall and Dick, architects, Newcastle, whose plans were selected in competition, will occupy a position at the corner of Coach-lane and Lovaine-place, North Shields, and when completed will accommodate 1,350 children, and in addition there will be a large cookery school for fifty girls. The first section of the scheme has been intrusted to Mr. Joseph Elliott, contractor. Mr. Moore is acting as clerk of the works. The arrangement of the school is on the central hall system. This hall runs the entire length of the school, and is lighted from the ends, the classrooms on each side, of which there are ten on each floor, opening directly off it. The hall on the first floor will be used for examination purposes or any large gathering. The school is intended to be used as an elementary school. There will be accommodation for 450 infants, and the remainder in equal proportions of boys and girls. The exterior treatment is in red brick with dressings of buff terracotta; the classrooms will be lined dado height with white glazed brick. The screens and other woodwork will be pitch-pine stained and varnished. The floors will be white maple wood. We illustrated the schools in our issue of May 15, 1896.

The Prince of Wales has accepted an invitation to pay a visit to Stammerham, Sussex, next month, to lay the foundation stone of Christ's Hospital (Blue Coat School), to be built from Mr. Aston Webb's designs.

A length of 1,100ft. of the new pier at Herne Bay has now been completed, and it is contemplated that by the end of the year another 1,000ft. will have been added. The whole structure of three-quarters of a mile is to be completed by May 30th next. The pier will have a large pavilion at the sea end and an electric tramway, the total cost being about £30,000. Messrs. Wighson Head, and Co., of Stockton, are the contractors.

The heavy imports of timber this year have continued of late. Last month we imported £510,000 more timber than in August, 1896. The increased value is mainly in sawn timber, especially from Russia and from North America. The activity at the great ports of import is this year in excess of any previous period, but the stocks are now beginning to increase rapidly.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

PHENIX.—There is the Society of Architects' examination. For particulars, write the Secretary, St. James's Hall, Piccadilly, W., and enrol yourself as a student.

RECEIVED.—O. C. G.—W. A. P.—H. M. H. and Co.

Correspondence.

THE STORY OF A LECTERN—AN OBJECT-LESSON.

To the Editor of the BUILDING NEWS.

SIR,—When the Church Conference took place in Exeter in 1894, Sir Somebody Richmond read a paper, "Art and Architecture," in which he spoke in contemptuous terms of architects and art-workers generally, and bid the parsons present and their friends, if they really wished to avoid disappointment and see their churches worthily adorned, eschew all such, and apply to the real artist (such, we assume, as himself?) for help. That this advice has received consideration in some quarters is apparent by the experiences just incurred at a college school in the North, where the new chapel has been lavishly furnished at no little cost to those interested.

In the current issue of the *Griffin*, the school in question's monthly chronicle, is so amusing a story of how those concerned went to a prominent artist belonging to one of Sir Somebody's own particular school, and the disastrous results thereof, that I am tempted to give it *in toto*, simply suppressing names. Here it is:—

"We now come to the eagle lectern, subscribed for and presented to the chapel by the parents. To those who are unacquainted with the latter end of the unfortunate history of this generous gift, we announce, with very great regret, that the lectern has been rejected as impossible. As will be remembered by all connected with it, the sum of £85 was collected. After taking a vast deal of trouble to ascertain from art people the best place to go for an eagle, this committee intrusted the matter to Mr. —, of —. The latter forwarded designs for approval. These were of a very sketchy nature, and indicated

no detail whatever, and were finally accepted by the committee on the strength of the artist's reputation, and his volunteered assurance that the finished work would be far better than any designs could possibly show. Mr. — therefore undertook, for the sum eighty-five pounds, to turn out a lectern which should be good in construction and of artistic merit. He went to work, and we heard from time to time reports of his progress; how the lectern was exhibited at the Arts and Crafts in London, and how it elicited the warmest approval from all beholders. An illustration of the work, taken from the front, appeared in a newspaper called the *Builders' Journal*. Mr. — also sent a photograph of it for the committee to see after he had received his cheque. It is only fair to the committee to say that this photograph was so extraordinarily bad that it might have been equally well meant to represent any other freak of nature or art.

"About the middle of this term the lectern arrived at —. It had apparently been thrown anyhow into a coffin-shaped crate before being despatched, without the slightest attempt at packing. The result of this was that it arrived broken in half at the place where the bird was glued on with wooden dowels to the oak shaft. This, however, was put right by a carpenter with a gluepot in a very few minutes. It was then solemnly carted into the chapel and placed in position. To do it justice, it was not aggressively offensive when seen from the doorway at the opposite end of the building. The nearer one advanced, however, the more palpable its overwhelming defects appeared, till close examination revealed, in English, that the whole concern was a miserable failure and an unredeemed fraud. The body of the *soi-disant* eagle consisted of a hollow cylinder made from thin copper sheet, covered from the neck to thighs with thin pricked and hammered plates intended to represent feathers; but from the thighs downwards shaped into a bare and offensive rump, modelled exactly on the lines of a fifty-six pound shell. The cylindrical body was surmounted by a gnome-like head and beak. The former seemed to be incased in a tight-fitting nightcap, or smooth wig; the latter shaped like a diminishing socket and barbed at the end like a cod-hook. The legs were as thick in proportion to the rest of the creature, as the trunks of two well-grown oak-trees would be to a geranium. These legs were incased in rough trousers of the peg-top variety. Peeping out from the extremity of these limbs were two or three tiny claws, faintly indicated by the scratches on the surface of the semi-circular globe, on which the bird stood, and into which it had apparently sunk. Above the spherical rump, fastened to the middle of the back with small screws and furniture tacks, was a flat kite-like representation of wings and tail, also made of thin plates of hammered copper soldered stiffly together. For some reason best known to the artist, Nature's designs for wings had been abandoned, and an extra and very angular joint inserted in the black iron wire which ran round the edge where the bones would be in a live creature. Two blood-red beads did duty for eyes, and gave to the expression of the countenance a hideously tame effect, reminding one of a white mouse. At the lower extremity of the tail was placed an iron ledge apparently intended to hold a Bible. As the whole construction rocked and swung about if touched, we did not risk the safety of our best Bible upon it, even for an experiment. The shaft of the lectern was, if possible, worse in construction than the bird above it. It consisted of a roughly-planed tapering base of foreign oak. At the base of this were four panels in *repoussé* copper, said to represent four of the Prophets.

"Mr. — had written several letters to the committee expressing his regret at having substituted Ezra for Jonah. He might have saved himself the trouble on this score. Having allowed us to pay our money, it would have been a small thing to have asked us to take our choice of prophets. However indifferent to the effect produced on the public by their personal appearance these Hebrews may have been, we doubt if even the mildest-mannered man amongst them would have clamoured for recognition as the original of any one of Mr. —'s blotchy hieroglyphics.

"Even if the execution of these hammered panels had been good, their effect would have been annihilated by being raised only 6in. or 8in. from the floor. Beneath them, the woodwork spread out into a very cheap and vulgar moulding, supported on four gilded balls; most of the

gold had been rubbed off, either in transit or before sending, revealing nothing more precious than the iron underneath, covered with a coat of paint. The carpentry work of the shaft was beneath contempt; the little ledges of wood above the panels being glued on instead of being (as any novice knows they ought to have been) worked out of the solid. The general effect from a short distance was that of a moulting and moribund crow, clinging with paralytic limbs to the top of a gate-post, and spending its last energies in laying a monstrous egg. A most depressed and depressing fowl, as one of the committee called it.

"The same evening that this bird was unpacked, a letter was written to Mr. —, begging him in the most courteous language that could be used, to allow this work of his to be returned to him, as wholly unsuitable to our chapel, and asking him to refund one-half of the money paid to him by the committee in final settlement of the whole matter. This he declined to do, on the curious ground that he was not a 'shopkeeper.' It is unnecessary to enter into the tone of Mr. —'s letters, or the nature of his witticisms. Suffice it to say, that after questioning our right to 'make away on the grounds of Mr. —'s personal taste with what he had been given to understand was a gift to the chapel,' he was presented with two more books full of the opinions of other people who had seen his lectern, and who will have to use the chapel. These opinions were not exactly fulsome in their flattery, even in the case of the only two out of the whole collection which expressed a qualified approval of Mr. —'s work. The eagle was variously described as a dodo, a blasphemous creature, an obscene beast. The artist replied that no opinions in the world made the slightest difference to him; that the only judges in such matters were 'the body of artists who from time to time pronounced judgment on works of art, as they had done, when they accepted his lectern for exhibition at the Arts and Crafts.' Here matters rest at the moment. For the past three weeks Messrs. Morton and Co., of 79, Bold-street, Liverpool, have had the lectern on show in their shop-window. They have advertised it for sale in the papers. Many people have been to see it; but no one has offered to buy it. In the opinion of experts who have examined the work carefully, £10 to £20 is the very outside figure which we can hope to get for it, even after finding someone who likes it. The simple reason for this is that the value is not in it. The woodwork might all have been done by a village carpenter's apprentice, and the panels and other hammered stuff would be child's-play to a Toynbee Hall mission class of boys raked out of the streets and encouraged, without any technical training whatever, to amuse themselves by hammering flimsy sheets of brass and copper into some sort of shape. If any of our readers happen to be in the neighbourhood of Bold-street, Liverpool, it will be easy for them to call and see for themselves how little credit this bird reflects upon the maker, and to judge for themselves of the effrontery of a man who could offer such a jerry-built amateurish abomination as adequate exchange for 85 sovereigns. Had the bird been dug up in a field somewhere, one would have felt inclined to say that it was a creditable performance for some rustic monk of the 12th century, who had never seen an eagle, and who had never been taught to hold a chisel or drive a nail. There are still some slight hopes that matters may be arranged by which Mr. — shall take the eagle back and refund some reasonable proportion of the collected money. Meanwhile it is best to look upon the whole sum as lost."

I may add, a sketch of the *rara avis* accompanies the above description, and quite suggests that the above scathing critique is by no means overdrawn.—I am, &c.,
HARRY HEMS.
Ecclesiastical Art Works, Exeter, Sept. 10.

POOR MORTAR.

SIR,—The letter of "A. H." in your issue of the 3rd inst. contains a statement that the building inspector said that "good mortar deteriorates by being kept after mixing," and also mentions the fact that sand and dirt spoil the quality of mortar. These observations serve as a peg on which to hang the following remarks.

Mortar made with anything but lime and sand does not deserve the name of mortar, if it is to be used for laying bricks. The chemical action that occurs in making mortar is something on this basis—I advisedly say "something," because the

action is too complex to pronounce a definite statement.

Limestone, when burned, becomes oxide of lime (CaO, chemically called calcic oxide). This body, when slaked with water (H₂O), becomes calcic hydrate—i.e., slaked lime (Ca(OH)₂). This hydrate of lime is a ready absorber of carbonic dioxide (CO₂, commonly called carbonic acid) from the air, whence the calcic hydrate becomes converted into calcic carbonate (carbonate of lime CaCO₃), of which chalk is a very pure specimen. Now, the hardening or "setting" of mortar is due to the action that occurs in the conversion of the calcic oxide (quicklime) into calcic carbonate, for while this chemical reaction is taking place, there is a chemical action also occurring between the lime salts and the silica of the sand, whereby there is a more or less partial silicate of lime produced, which sets hard as stone. Now the hardening of mortar is due to the formation of this silicate of lime, which binds the particles of sand together in a closer bond, according to its production: the more silicate of lime produced, the firmer or harder the mortar becomes. From this fact, it is easy to see that any material which lessens the chemical reactions occurring in the lime and sand also lessen the cohesion of the particles of mortar; and hence mortar made with lime, sand, and any third material, such as garden-mould, cinder-ashes, builder's rubbish, &c., will never properly harden.

Again, let us consider the case of lime exposed to the air. Limestone, when burned, becomes converted into quicklime (CaO)—i.e., oxide of calcium—and this quicklime, when slaked with water, becomes converted first into hydrate of lime, and then, on exposure to the air, into carbonate of lime; but by prolonged exposure to the air, the carbonate of lime becomes reduced again to calcic oxide, because the CO₂ in the CaCO₃ (calcic carbonate) forsakes the CaO, and thus leaves it in its original state; but although such CaO is still quicklime, or oxide, it does not possess the energetic chemical action which quicklime does when freshly burned; consequently slaked lime that has been a long time exposed to the air does not make such good mortar as does lime which has been freshly burned and slaked.

Your correspondent "A. H." mentions the act of the old Romans keeping their mortar in pots for two years before using it; by such keeping there was a formation of silicate of lime carried on, and consequently when such mortar was exposed to the air, it rapidly set or hardened. If, however, such mortar had not been kept in pots, but left exposed to the air all that time, it would have become practically useless as a binding material, owing to the great amount of CO₂ which the lime would have imbibed (any builder knows that there is no binding property in a mixture of chalk and sand when mixed together with water). In the case of the early Italian fresco painters, they used to put the lime for years in caves or pits before use, so as to cause it to lose its causticity by the gradual expulsion of the CO₂, and then produce a "fat" CaO, which, when laid on a surface as a fresco ground, would quickly imbibe CO₂ from the air, and thereby inclose the colour in a layer of carbonate of lime, which held the paint secure against atmospheric influence and vapours.

It has been a noticeable fact that the death-rate in Birmingham during the past few weeks has been abnormally high—as much as 42 per 1,000, and in Wolverhampton even higher than that. A few facts will throw light on the cause. The Birmingham sewers are notorious as being overrun with big fat rats, which burrow their way into houses, and consequently permit of the ingress of sewer-gas into dwellings. Another factor in engendering disease is the great diversity in the levels of the drains and sewers in and around Birmingham. The city is built on several hills and slopes, and therefore it is impossible for the sewer-levels to be constant, like those of London. As a consequence, stagnant pools of sewage remain for a considerable time undisturbed. But chief of all the causes that have brought about the high death-rate is the large amount of jerry-building that is being carried on around Birmingham. During the last ten years the growth of the suburbs has wonderfully increased, and the ubiquitous "jerry"-builder is everywhere in evidence. Now, apart from the shoddy nature of the structures erected by such men—porous bricks, ill-fitting doors and windows, shaky floors, thin slates for tiling, &c.—the chief sins of the individual are that the erection of most of these

dwellings is on "made ground"—that is, hollows which have been filled up with dust-bin rubbish and garbage of all kinds, even road-scrappings, mud, and slush; the employment of mortar composed of a very little lime, any kind of sand, and a large quantity of sifted ashes from dust-bin rubbish, and the use of a plaster of mud on the walls. These shoddy erections are euphemistically called villas. They consist of a "reception and dining-room and three good bedrooms, with hall entrance, vestibule, &c." (save the mark!—they would be called workmen's cottages in London), rental 6s. weekly. The writer knows for a fact that the contract for all the brickwork in such villas is often taken at £15 per house.

The culmination of all these evils is this. The foul emanations that rise up from the ground on which the building is erected give rise to diphtheria and other blood and lung troubles. The bad mortar allows the walls to be perpetually damp. An hour's shower of rain will make any outside wall, which is usually only a 9in. one, so saturated with wet as to require a week's dry weather for such wall to become dry again. The mud that has been plastered in the interior of such walls also emits a most offensive stench, perfectly unbearable within 6in. of the wall. When the plaster becomes damp from the moisture that has penetrated through the bricks, there is a constant emanation of a germ-breeding effluvia from the plaster that is a most prolific cause of throat and lung diseases to all who sleep in such rooms, while the damp, fetid odour that arises from the ground underneath the basement-boards or tiles is supposed to cause paralysis in six months. Apart from all these evils, the air outside the houses is polluted for miles by sewer-gas that is belched forth from the street-pipes, which are erected along the main roads to ventilate the sewers. Strange to say, a native "Brum" is invariably boasting of his city being healthy, and is ever ready to cram down the throat of any doubter the height Birmingham stands above the sea-level, notwithstanding this argument is the greatest absurdity, for the height above sea-level matters not a jot if the air that is breathed at that altitude is foul and poisonous, which Birmingham air is.—I am, &c.,
H. C. STANDAGE.

Erdington, near Birmingham.

PLASTERERS' STRIKE IN LIVERPOOL.

SIR,—The strike of plasterers in Liverpool, which commenced on the 1st of May last, still continues, and is being prolonged through the men on strike being employed by other contractors throughout the country, and I am instructed to write and ask if you will kindly request the members of local associations to refrain from employing these men during the dispute. The Master Plasterers are contending against the full strength of the National Association of Operative Plasterers, and it is an open secret that, if they are defeated, the operatives in other branches of the building trade in Liverpool intend to make similar claims, which include:—

- (1) Limitation in the number of apprentices.
- (2) The right of their delegates to visit all works to converse with the men.
- (3) Railway fares in and out to country jobs weekly.
- (4) That none other than plasterers do concrete flooring, floating for wood blocks and tiles, and lathing.
- (5) The privilege of working overtime, when insisted upon by the men, to be paid time-and-a-quarter; and several other similar unreasonable demands.

If the Trades Union is successful in Liverpool these claims will, no doubt, be made in other towns. The officials have declined arbitration, and intimated that the operatives will not return to work until the whole demands are conceded.

I am instructed to ask you to call the attention of the members of all associations to the resolution which was unanimously passed at the recent meeting of the National Master Builders' Association, at Bristol, enforcing the necessity of all employers increasing the number of their apprentices in order to remove the present inconvenient scarcity of labour.—Yours faithfully,

J. ALFRED S. HASSAL, Secretary.

National Association of Master Builders of Great Britain, South Crescent Chambers, 26, Lord-street, Liverpool, 7th September.

P.S.—In taking on any plasterers during the present dispute, my Association would suggest that full inquiries be made as to where they were last employed.

HOTEL METROPOLE, MORECAMBE.—SELECTED DESIGN.

THIS design, by Messrs. Mangnall and Littlewoods, of Manchester, was selected for the first prize in the public competition held recently, Messrs. Harrison, Hall, and Moore, architects, of Preston, acting as the assessors. The site for this hotel is at the extreme west end of Morecambe, and is bounded on its two sides by the sea front and the side promenade. The lodging-houses are principally facing Heysham-road, which is to the back of the plot, and Sefton-road, which runs along its right-hand side. The two refreshment-bars are placed at either corner of Heysham-road. All the principal rooms for visitors, together with the main entrance of the hotel, face the sea; the public portion of the hotel is situated opposite the side promenade, and is approached by a separate entrance; there are also to this side entrances for visitors, arrival and departure. These doorways are controlled by the manager's office and clerk's bureau. The ground floor accommodation includes a drawing-room, reading and writing room, sitting-room, and dining-room for private parties; a recreation-room, with the attending stage and retiring rooms. The coffee-room and dining-room are situated to the right-hand side of the front, and some of the principal administrative rooms in connection with it are placed on the ground floor, to expedite service and insure better supervision. These include manager's directing-room, service-room, china-cleaning and store room, plate store and strong room, wine-dispensing room, and the service staircase. Directly in the centre of the front is the grand hall, which contains porter's room, telephone-room, and lift. Between this and the grand staircase is the promenade corridor, which would be much appreciated in inclement weather. At the back of the grand staircase is the palm-house and smoking-lounge. The public portion of the hotel is kept entirely distinct, and contains a large smoke-room and a billiard-room for two tables. The basement contains all the necessary kitchens, store-rooms, and larders, laundry, &c., and a boiler-house and engine-room for the generation of electric light, &c. There is also a barber's shop and cycle room. There are 150 bedrooms, 8 sitting-rooms and bedrooms for servants in the hotel, 107 of which either face the sea front or side promenade. Provision is made for housemaids' room, service room, lavatory, &c. On the top floor is a photographic printing-room and two dark rooms for visitors. The hotel is designed in the English 17th-century Renaissance, and it is proposed to construct the principal elevations in buff and red terracotta, the cost being about £30,000.

CORTILE, PALAZZO BALBI, AND STAIRCASE, PALAZZO DELLA UNIVERSITA, GENOA.

THERE are not two finer examples of architecture in their way in all Genoa than these two courts,

yards, which we illustrate to-day. Of the Palazzo Balbi we gave a double-page pencil drawing by Mr. Maurice B. Adams in our Double Number, Jan. 3, 1896, and we then also described to some extent its next-door neighbour, the Palazzo della Universita, with its noble staircase and famous lions flanking the first flight from the cortile. The similarity of the treatment of the arcades in these two palaces can scarcely fail to strike the visitor, though there is a dignified simplicity in the grand proportion of the Balbi colonnade scarcely equalled among the Genoese palaces. The plastered walls are often referred to as one of the distinguishing features of Genoa, "the queenly city," and its white façades of stucco are quoted in evidence of the advantage and durability of that plastic and useful material. The accompanying photographs show a style of work well suited for the courtyards of many modern town buildings, and afford a fitting contrast to the fussy and over-detailed terracotta work, with its confectionery of ornament, such as we see in some of our more recent club-houses and hotels in London, devoid of dignity, cut up with endless jointings, petty in scale, as well as poor in proportion and idea. It is an advantage, therefore, to have work such as that here chosen for reproduction to-day placed before us as a corrective, at any rate; for they tend to inspire the eye and cultivate the taste, even if the exigencies of ordinary practice only too often prevent the architect from emulating such work, even though he may have the skill and good taste to do so.

TENEMENT HOUSES, AND BUSINESS PREMISES, LEITH.

THIS block of buildings occupies a good site in Great Junction-street, and has been erected

PLAN OF UPPER FLOOR

10 5 0 10 20 30 40 50

by Messrs. Anderson and Co., Manufacturing Chemists, Junction Bridge Works, Leith. The stone used for dressings was red Corsehill, and for facework of walls, a stone from Hermand, of a greyish-blue colour. The slates were from Westmoreland, of a sea-green colour. Mr. James McEwan, 15, Hanover-street, Edinburgh, was the architect of the work, which was carried out by Mr. James Slater, contractor, Easter-road, Edinburgh.

ST. MICHAEL'S PARISH CHURCH, SITTINGBOURNE.

(See description on page 390.)

A COUNTRY HOUSE.

THIS house, illustrated from Mr. John Cash's Royal Academy drawing, represents a gentleman's house, designed by him to be built in brick and half-timber, in a picturesque and suitable style adapted to the surroundings of the site. In execution the buildings have, we understand, been modified in plan, which will sufficiently account for the plan not being shown here with the view.

GATE HOUSE, LOSTOCK HALL.

THIS building is a good specimen of the Domestic architecture of the closing years of the 16th century. It was built, according to the date on the uppermost panel, in 1590 A.D., of local stone, and is in a very fair state of preservation. The Hall itself, which was the seat of the Andersons, was a half-timber building, and was finally demolished at the beginning of the present century, together with some buildings adjoining the Gate House. There is a rough representation of the latter punched in the lead of the flat which covers the present building. The Gate House is now used as a farmhouse.—JOHN ORMOND.

Lord Herschell will deliver an address, on the 19th October, at the opening of the Art Gallery, which has been added to the municipal buildings at Reading.

The erection of the London County Council's new Lunatic Asylum at Horton, near Epsom, has given the Epsom Rural District Council a good deal of anxiety. Several hundred men are engaged in excavating and laying the foundations of the asylum; but the accommodation for them is so limited that large numbers have been compelled to

sleep out, while others have erected a tent which contravenes the by-laws. The medical officer has informed the Council that they have no power to compel the contractor to provide accommodation for the men. The Asylums Committee of the London County Council have made ineffectual efforts to arrange for special workmen's trains, and in view of the fact that after Christmas the number of men will be increased to 1,600, the Epsom Council are considering the advisability of applying to the Local Government Board for sanction to borrow £7,000 or £8,000 for the immediate erection of fifty cottages to accommodate some 500 men. Before definitely deciding upon this step, they have asked the London County Council to inform them what steps they propose to take to meet the difficulty.

QUESTIONS.

[11781.]-**White Plaster.**-What is the best white cement or plaster for external use on brickwork in half-timbered work? The situation is very much exposed to cold winds and bad weather, and I have already used a well-known cement, but after a short time the finishing coat separated and shelled off. Portland cement would require frequent painting. I should like a white cement, if it would be durable.-W. B.

[11782.]-**Water Supply by Meter.**-I shall be much obliged for a list of towns where water is supplied by meter, and the price charged per 1,000 gallons.-X.

[11783.]-**Tile Roofs.**-Should the "lap" be measured from the top of the tile, or from the nail-hole, which is about 1½ in. below the top? I have always understood the latter; but have a dispute with a contractor on the matter.-M.

[11784.]-**Office Routine.**-I am anxious to ascertain the best means of planning out the office routine work of an architect's business—such as the necessary books and accounts, handling and filing of correspondence, and other papers. I am not aware of the existence of any literature dealing with the subject, and shall, therefore, feel much obliged if any of your readers can refer me to any books, pamphlets, or articles treating on the subject.-CASHIER.

[11785.]-**Architects' Accounts.**-Can any reader give me the title, and author's and publisher's names of any book dealing with the keeping of accounts by architects? If possible, a note as to the published price will add to the value of the information.-S. E. C.

[11786.]-**Imitation Stone.**-Can anyone give me a simple recipe for imitation stone which does not necessitate burning, the chief ingredient of which should be good sharp sand?—W. R. P.

[11787.]-**Damp-Course.**-Which is the best and cheapest way of inserting a damp-course in an existing brick house which, unfortunately, was built without one?—T. CORNELIUS WHEELER.

[11788.]-**Church Bell.**-The wooden axle of this bell has given way. The rope is attached to a wooden wheel about 4ft. in diameter. The bell weighs 200lb. In refixing, it is desired to get rid of these wooden parts, and substitute steel for axle, and cast-iron wheel. Hitherto this bell has not sounded properly. The tongue clattered always when it struck on one side of the bell. How can this be remedied? Should there be a back-weight in the wheel? If so, where attached and what weight? What proportion should the weight of the tongue bear to that of the bell? Also, where is the proper point of suspension? Would it be better to have the bell fixed, and the rope attached to an arm in the tongue working on a pivot? This would avoid the clattering. Would the bell then give a clearer note?—BELL RINGER.

[11789.]-**Filling for Wood Joints.**-Can you advise a cement to be used as a filling for open joints in a chemical laboratory wooden bench—it should be able to resist boiling water?—L. M.

REPLIES.

[11770.]-**Greenhouse Stove.**-I did this by means of a pair of semicircular bellows, equivalent to an ordinary "atmospheric ring." They were made of iron tube and pierced, as shown in the sketch. Of course, air inlets

must be provided near the nozzles. A ring all but 12 in. in diameter can in this way be introduced through a stoke-hole 4 in. square. The draught through the body of the stove must be damped down, or it will run away with nearly all the heat. It is a good plan to fill in most of the central space with pieces of brick. The arrangement works well enough, but you will find it expensive in gas. If you care about that, you will save money by turning out the coke stove and replacing it by a proper gas-heated boiler.—R. C. GILSON, Harrow.

[11773.]-**Dover and its Neighbourhood.**-“A Tourist” will find an old structure of interest in the Town Hall in Biggin-street. The hall of Maison Dieu is a 13th-century building, and was built as a hospital for pilgrims coming from the Continent to Becket's shrine, Canterbury. The adjoining buildings are modern. Its main features are a fine oak-framed roof, very massive, and some interesting painted glass. The Norman remains of the refectory of St. Martin's Priory (now used as the hall of Dover College) is an interesting Norman structure. There is also the chapel, restored. These buildings are near the Priory Station of the L.C. and D.R. Railway. The foundation of the Knights Templars' Church may be seen on the Western Heights. The most interesting old buildings are St. Mary, in the Castle, partly of Roman work, restored and used as a garrison church; the Pharos, of Roman bricks and tufa, near the west end of church; St. Mary the Virgin, Cannon-street, with its fine Norman arcading in tower, and arcades and frescoes over western arch; St. Margaret's-at-Cliffe Church, St. Margaret's Bay, which has a fine enriched Norman porch, nave, arcading, and clerestory built of flint, and a beautiful painted glass E. window; Buckland Church, also churches at Ewell, Alkham (E. English), five miles from Dover,

St. Radigand's Abbey, a ruin near the village of River, Barfrestone, the oldest Norman church in Kent, &c. Of course, the tourist can go to Canterbury and see its world-famed noble cathedral, and other churches, like St. Martin's, St. Augustine's Abbey; visit Folkestone and Hythe, with their fine churches, to the west of Dover; Deal, and Walmer to the East, and look at Deal Castle and Walmer Castle. All these places are within walking and short railway distances.—A RECENT VISITOR.

[11773.]-**Dover and its Neighbourhood.**-As might have been expected, there is a great deal of Norman work in this locality, in addition to the Castle. A very interesting church is worth “A Tourist's” visit, that of St. Margaret at Cliff, between Martin Mill Station and St. Margaret's Bay. He will find here a flint-built church with low square western tower of massive design, nave, and aisles. Externally, there is a unique Norman clerestory with shafts and blind arcading between the plain Norman lights. The porch has a handsome inner doorway of the same character, highly enriched with chevron, billet, and other ornaments in the arch; the jambs have shafts. Internally, the nave has Norman arcades, and four bays resting on circular and compound pillars alternating, the latter of four engaged shafts placed on the square. On the nave and aisle sides are piers like vaulting shafts. A chevron ornament is carried round each arch. The roof is cross-braced. There is a long chancel pierced by three circular-headed lights over the altar, and above, in gable, a two-light Norman window. The tower is open to the nave. The parish church of St. Mary's in the town has a fine tower with blind Norman arcading between the flat-faced angle buttresses, and is a good specimen of a Norman tower. Inside there are remains of arches in the same style.—G. H. G.

[11773.]-**Foundations in Soft Ground.**-I doubt whether “J. J.” will find any high buildings in this country carried, in the manner he describes, by concrete rafts, with rods imbedded in same. In America concrete platforms have been used as foundations. A work on foundations has, I believe, been published in New York, which will give the information desired.—S.

[11774.]-**Flint Walls.**-Flint walling is used largely in chalk districts; the flint makes a good wall, impermeable to moisture and hard. The walls should be built in the same way as rubble is, the window recesses or reveals being built in brickwork in the same manner as in brick-walls. It is used largely in Norfolk, Suffolk, Sussex, and Kent. These are cut and trimmed, they should be built thick (about 2ft. in thickness); the flints should be flushed up with stiff, strong mortar. The mortar should be of quicksetting stone lime and coarse sharp sand. The walls should be bonded with lacing courses of brickwork, three or four courses deep. Before building flint walls, it would be as well for “G.” to go to one of the districts named and make inquiries as to the thickness of walls and other particulars from a practical mason. Their durability is unquestionable, and in Norwich and other places in the eastern counties, also in Sussex, very effective treatment of flint with brick courses and dressings may be seen.—G. H. G.

[11777.]-**Map and Plan Drawing.**-I am not aware there is any book treating specially of this subject. Haskoll's work on Surveying may be found of use. I believe it is published by Lockwood and Co. The angles of fields can be obtained by any angular instrument having a vertical wire and a graduated table on which degrees and minutes are marked. The bendings or sinuosities of a field or a stream is obtained by running a chain-line along one side of the stream and taking offsets to the banks. By plotting these lines and offsets on the plan, the irregularities and curves can be determined. Baker's “Engineering Surveying,” or Haskoll's work will give “B. D. A.” all he wants to know.—G. H. G.

CHIPS.

The village schools at Chappel, near Halstead, Essex, have been reopened this week after enlargement and improvement, carried out by Mr. Beard, a local builder.

Mr. Compton Rickett, M.P., laid on Friday last the foundation-stone of a new Congregational church in Manor-road, Scarborough. The estimated cost of the building and site is £2,000, towards which £900 has already been raised.

The Handsworth Urban District Council adopted, on Friday, a report of the highways committee which recommended that the salary of Mr. E. Henworthy, C.E., the surveyor, be increased from £400 to £500 per annum.

Birdforth Church, which dates back to the 15th century, and was originally built as a wayside chapel, situated about five miles to the south of Thirsk, has been restored. The original building was of brick, surrounded at the western end by a turret, on which was placed a wooden “cote.” The restoration has been effected at the expense of Viscount Downe. The old building has been re-roofed with French tiles, and the old pigeon-cote turret has been rebuilt with clamp bricks. The interior has been re-floored and re-seated, and the windows re-glazed.

Sentence of nine months' hard labour was passed, at the County of London Sessions on Monday, on Albert Bayliss, 25, furniture dealer, who was convicted on Friday last of offences against the Bankruptcy Acts. In order to defeat a claim, Bayliss entered into a bogus agreement to transfer his business at Station-road, Finsbury-park, to a man named Foster. He also, it was alleged, after having been adjudicated bankrupt, removed some of his property, and also made certain false entries in a document to conceal the state of his affairs and to defeat the law.

The Free Public Library at Norwich was reopened last week after enlargement and restoration. The large apartment formerly used as the hired room for exhibiting the collection now removed to the Castle has been converted into a reference library, and the exterior of the building, the stonework of which had fallen into a lamentable condition of decay, has been coated with Tabary's metallic stone cement, this portion of the work being carried out by Messrs. Dreyfus and Co., of City-road, E.C. The whole of the work has been carried out from the plans and under the direction of Mr. A. E. Collins, the city engineer.

Another sale of building plots on the Thursley Manor Estate at Benfleet took place on Wednesday week, when a large number of Jews—probably from 400 to 500—again attended, and many of them bought land upon which to build houses or shops in what promises to be, practically, a Jewish city in South East Essex.

Arrangements are being made for unveiling the work at West Smethwick, on Oct. 2, of a bust of Mr. James Timmins Chance, the donor of the park, which is being placed in the grounds by the trustees as a permanent memorial of the gift. The bust, which is the work of Mr. Hamo Thorneycroft, R.A., will cost close upon £1,000, including the provision of a suitable place for its reception.

The opening of the harbour extension and new pier at Polperro took place on Thursday in last week. The work has consisted in the removal of about 70ft. of the inner western pier, and the lengthening of the eastern pier by 30ft., while, on the opposite shore, a new stone pier of about 40ft. has been erected. The works, which have been carried out by Mr. J. Lang, Liskeard, cost £1,000. The engineers were Messrs. Jenkin and Son, Liskeard.

The death occurred, on Tuesday, from pneumonia, of Mr. Henry Borrowes, art master at the Huddersfield Technical School. Mr. Borrowes, who was a native of Pickering, and was fifty years of age, was for some years head master of the Corporation School of Art, Newcastle-on-Tyne, and went to Huddersfield in 1880. He was known for excellence of work in water-colour drawing and portrait painting.

Rawcliffe Hall, near Goole, the residence of Mr. Ralph Creaky, D.L., and ex-high sheriff of Yorkshire, was partially destroyed by fire on Sunday. The fire originated in the west end of the mansion, and is supposed to be attributable to a beam in the chimney catching fire. The more ancient half of the house, dating from the 17th century, was burnt out. Most of the contents of the lower rooms, including valuable Florentine furniture, curios, and pictures by well-known painters, were saved. The damage, which is covered by insurance, is estimated at £15,000.

The churches of Hampton Lovett (near Droitwich) and Kirk Ella (near Hull) have just been successfully lighted by means of the “Cathedral” lamp, supplied by Messrs. Jones and Willis, of Birmingham and London.

The Bangor county school, Bangor, North Wales, is being warmed and ventilated by means of Shorland's patent Manchester grates and special inlet panels, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Grand Central Station at New York, the headquarters and metropolitan station of the New York Central and Hudson River system, is now being enlarged and entirely changed as to its exterior, although the interior arrangement of the ground floor is not to be changed at present. The original building was 240ft. on Forty Second-street by 692ft. on Vanderbilt-avenue. Three more stories are now to be added, giving a uniform height of six stories, and the towers to be carried up proportionately. The entire building will be faced with stucco, and the enlargement will cost 700,000dol. The added room thus provided is needed for the executive officers and the 500 to 600 clerks employed.

An American syndicate, which has discovered immense timber forests in Labrador, will take a lease of the tracts from the Colony of Newfoundland. They will begin operations next season.

A new Roman Catholic school has just been built at Crief, Perthshire, from plans by Mr. T. Monteath, of that town. It is faced with Dunmore sandstone, provides a nice hall 50ft. by 20ft., and 16ft. in height, and classrooms. Accommodation is provided for 130 children, at a cost of £7 10s. per head.

At Chadderton, near Oldham, on Tuesday, three steeplejacks were repairing the top of a very lofty mill chimney, belonging to Messrs. M'Dougall, chemical manufacturers, when part of the coping gave way, and one of the men, John Greenwood, was killed by falling to the ground. A large mass of brickwork fell on his body. The other steeplejacks had a narrow escape, one saving himself by clutching the scaffolding.

Engineering Notes.

BRIDGING THE MISSISSIPPI.—A contract has just been concluded by the Chicago and Alton Railroad Company with the Lasig Bridge and Iron Works, of Chicago, for the construction of a new bridge over the Mississippi at Louisiana, Missouri. The new structure is intended to replace an existing bridge, which was built in 1873, when loads were much lighter than they are now. The new structure will be a single-track bridge of nine spans, and will carry two locomotives of 123 tons each, followed by a rolling load of 400lb. per lineal foot. There will be five spans of 158ft. each, a draw span 440ft., and three other spans respectively 257ft., 226ft., and 316ft. long, making the total length of the bridge 2,029ft. The foundations will be masonry on piles, and the bridge will be 12ft. above the high-water mark. The new bridge will be built under the old structure, and there will be no interruption of traffic.

EDINBURGH.—The new North Bridge was formally opened on Wednesday by Lord Provost McDonald and the magistrates and council. The undertaking replaces the old North Bridge, which, begun in 1763, was opened in 1772, having taken nine years to build. Under the present contract, the old bridge has been renewed and the new bridge erected in about two and a half years. The old bridge had to be taken down and the new bridge built without interfering with the railway traffic being carried on underneath, or the tramway and other street traffic above. Scaffolding of a peculiar construction had to be employed, and methods of working more or less of a novelty had to be introduced as the work went on. The first half of the new bridge, having been completed, was opened on the 12th October, 1896, and the remaining half of the old bridge was taken down and the last half of the new bridge built between that time and this—a period of eleven months. The best view of the structure will always be secured from Jeffrey-street. It affords an immense improvement overhead to the street traffic, while underneath the Railway Company get, in greatly enhanced facilities for the carrying on of their traffic, the full value of their contribution towards the cost of the bridge. The bridge is built under an Act of Parliament obtained in 1894, which also authorised the widening of North Bridge-street—an improvement now also in progress. Constructed of iron girders resting on stone piers and abutments, the bridge consists of three spans of 175ft. each. The width between the parapets is 75ft., as compared with 54ft. of the old bridge as altered more than twenty years ago. Each span is formed of six steel arched ribs, each 175ft. from pier to pier, with a 20ft. rise at the centre of the arch. They are set into the masonry of the abutments in cast-iron springers, each weighing 12 tons. The holding-down bolts are 3in. in diameter. Each rib is 4ft. in depth by 1ft. 9in. in breadth, and it weighs about 40 tons. They were built at the Glasgow works of Sir William Arrol (Limited), were milled to suit the radius, and were delivered in nine-ton "lifts" or segments. On top of these "booms" are fixed vertical posts, which carry longitudinal girders, and on these again are fixed cross-girders, which carry the brick arching forming the roadway. The whole is braced diagonally and horizontally by lattice-girders, &c. In the bridge there are about 2,000 tons of chilled steel and about 500 tons of cast-iron work, which is chiefly of an ornamental nature. The spandrels of the great spans are filled in with an arched graduated in height, surmounted by a frieze broken up by carved corbels, and carrying a moulded festoon of flowers and fruit. At each end of the large spans is an expansion joint, which has a play of 1½in., so as to make due allowance for expansion and contraction caused by the summer and winter temperature. In taking down the old bridge nothing of great interest was found. The only curious objects embedded in the masonry were an old pewter jug, now in the Antiquarian Museum, and several old moulded headstones and carved stones, as if from an ancient church. The foundation-stone, laid on the 21st October, 1762, by Lord Provost Drummond and the "Merrie Masons" of his day, was not discovered. The abutments at the south and north ends of the bridge rest on solid rock. The two large piers are built on concrete foundations, laid, the south

pier 40ft. below the rail level, and the north pier 35ft. below ground. Each of these piers is 100ft. long, measuring from east to west, and 22ft. in thickness. They are hearted with brick laid on cement, and faced with grey sandstone ashlar. In the construction of the bridge there has been used by the Messrs. Beattie 100,000 cubic feet of ashlar, equal to 8,333 tons; nearly 3,000,000 bricks, and 10,000 cubic yards, or about 800 tons, of concrete. In addition to this there were half a million of blue bricks required for the arching, already alluded to, which carries the roadway. From the spring of the arches the piers are carried up above the iron parapet of the bridge with ornamental panelled and moulded faces, and below the top moulding is a carved ornament. On the top of the arched brick, asphalt has been spread, and on that are placed the granite blocks of the roadway. The cable rails have been laid, and on each side of the roadway of the bridge a subway for pipes has been constructed, about 12ft. by 2ft. in depth, with manhole entrances at each pier. The engineers of the bridge were Messrs. Cunningham, Blyth, and Westland, C.E., Edinburgh; the City superintendent of works, Mr. Robert Morham, designed the elevation; the contractors were Sir W. Arrol and Co., Limited, Glasgow, with Messrs. William Beattie and Sons, Edinburgh, sub-contractors for the mason work. The cost is £90,000, of which the North British Railway Company contribute £30,000.

GLASGOW.—The new Prince's Dock at Cessnock, on the south side of the Clyde, formally opened by the Duchess of York on Friday, is close to the shipbuilding district of Govan. Nearly fifteen years have elapsed since the construction of Prince's Dock was decided upon. It has cost, including the graving dock and equipment, nearly a million and a half sterling. Mr. James Deas, C.E., the engineer of the Clyde Trust, who had designed and superintended the construction of Queen's Dock, was commissioned to prepare Parliamentary plans for utilising the space for docks. Spacious outer and entrance basins give access to a canting basin, from which branch eastwards at right angles to the basin and parallel to the river course three large basins, separated from each other by spacious quays. The canting basin is 1,135ft. long, and large enough to allow of the easy turning of a vessel 700ft. long, if ever such a leviathan should be constructed. Each of the three basins is about 300ft. broad and 1,200ft. long, and the intervening quays have a breadth of 250ft. The depth of water in the docks will be from 20ft. to 28ft. at low water, and from 31ft. to 39ft. at high tide. The water area, including the canting basin, 15½ acres, is 35 acres, and the quays measure 3,737 yards—over two miles. Originally the trustees obtained power to construct two graving-docks at the head of the inner basins, but that idea was abandoned in favour of one large dock, parallel to and immediately south of the two existing dry docks, and with access from the entrance basin of the new dock. This dry dock, of which the Duke of York laid last week the last cope-stone, is one of the largest in the world, is 880ft. long and 82ft. broad on the floor, and 115ft. broad at the top. It has an entrance 83ft. wide, and the depth of water on the sill is 26½ft. The dock can be divided by steel gates into two practically independent sections, the outer 460ft. and the inner 420ft. long. The total cost of the dock, including the pumping and other apparatus, is about £240,000.

SCARBOROUGH.—Mr. J. E. Everett, the resident engineer for the construction of the road round the Scarborough Castle Hill, reports that up to September 1 there had been laid a total length of 204ft. of wall, 18ft. high, or within 4ft. of the finished height; 172 blocks had been made, containing 369 cubic yards of concrete. As soon as the cliff was made safe to work under, more rapid progress than had hitherto been possible might be expected. Every effort was being made to push on the work of sloping the cliff, the worst part of which is now finished. The Scarborough Castle keep and walls are to be included in the proposed lease of the Castle Hill to the Scarborough Corporation, the plateau, or "yard," of which it is intended to lay out in pleasure grounds. The corporation's present lease of the dykes and holmes expires on April 5, 1903. This the corporation are prepared to surrender, and they express their willingness to take a fresh lease for 31 years of the whole hill and the dykes and holms at a yearly rental of £150, the corporation undertaking the ordinary

maintenance of the keep and walls if before the date of the new lease the fabric is put into substantial repair by the Woods and Forests Department.

CHIPS.

The dissolution is announced of the partnership hitherto subsisting between C. A. Hindley, E. H. Hindley, and J. A. Stenhouse, upholsterers and decorators, Welbeck-street, W., under the style of Charles Hindley.

A stained-glass window is about to be placed in Truro Cathedral by Eliza Lady Truscott, in memory of her husband, the late Sir Francis Wyatt Truscott, who was a native of Truro, and served as Lord Mayor of London in 1879.

The city council of Sheffield accepted with thanks last week a three-quarter size portrait by Mr. Ernest Moore of the late Alderman Edward S. Foster, a former mayor of the city, who took a very active part in the promotion of the scheme for the erection of the town hall, and for the street improvements in the centre of the city. It was agreed to hang the portrait in the new town hall.

At the last meeting of the Southend Town Council a cheque for £922 was drawn in favour of Mr. Brunlees, the original engineer of the pier extension, being the amount awarded to him by the arbitrator, with costs. The question of the costs of Mr. Brunlees' solicitor stands over.

The vice-chairman of the Huddersfield School Board formally opened, on Friday, the newly-enlarged board school at Spark Hall, Longwood. The event was of some interest, and the Huddersfield School Board have had no new buildings or extensions opened during the last five years. Longwood is progressing both industrially and numerically, and to the Spark Hall school 152 places have had to be added. For this purpose two cottages were bought for £300, and other land, which brought the total cost of the enlargement to £2,935. The additional accommodation includes a covered playground for the children.

New board schools are on the eve of completion at Burnham-on-Crouch from plans by Mr. F. Chancellor, of Chelmsford.

A new organ in the Wesleyan Chapel at Burnham, Somerset, built by Mr. W. Sweetland, of Bath, was opened on Thursday in last week.

The parish church of St. Mary, Postling, East Kent, was reopened on Thursday in last week, after restoration, at a cost of £600.

The scheme for restoring Brierley Hill parish church has had an unexpected development. It was estimated that the total expenditure would be £3,500, of which Mr. John Corbett, of Impney, Droitwich, promised to contribute one-half. The response of the parish was so satisfactory that more than the amount needed was raised. At a meeting of the general committee, to receive tenders, there was great surprise when it was found that the amount in every one of the seven tenders was almost double the sum named in the estimate—the lowest being £6,797, and the highest £7,852. A deputation is to wait upon Mr. Corbett to talk the matter over.

The work of restoring the ancient parish church of Wilmslow has now been taken in hand. The chancel roof is to be raised and a clerestory inserted, various changes are to be carried out in the De Trafford and Pownall chapels and the nave, and new entrance-gates and boundary-walls are to be erected. The work is expected to cost nearly £2,000, towards which £900 has already been raised.

The formal opening of the new building now nearing completion at Eglinton Toll, which is for the use of the southern section of the Glasgow United Young Men's Christian Association, took place on the 9th inst. The building contains a large hall capable of seating 800 people, a smaller hall, eleven educational or class rooms, a gymnasium, a social parlour, a library and reading room, as well as other smaller rooms.

A parish hall is about to be built at Nigg, near Aberdeen, from plans by Messrs. Walker and Duncan, architects. The estimated cost is £750.

Last winter's gales have proved terribly destructive and costly to the River Tyne Commissioners' work in making the Tyne a harbour of refuge at all states of the tide for any vessel. A breach has been made in the North Pier. Repairing is declared to be impossible, and the advice of Sir J. Wolf Barry, C.E., and Mr. C. E. Matthews is to rebuild the pier from the breach sea-ward, at an estimated cost of £302,000. The piers had just been finished when the misfortune happened. The River Tyne Commissioners, on Friday, practically adopted the report of the experts.

Lord Balfour of Burleigh, Secretary for Scotland, formally opened, on Friday, a fine new school at Clackmannan, which has been erected at a cost of rather over £3,000, to accommodate some 400 children.

LEGAL INTELLIGENCE.

A BOROUGH SURVEYOR'S FAILURE: IN RE R. S. DUGDALE, OF HUDDERSFIELD.—The public examination in bankruptcy of Mr. Dugdale, borough surveyor of Huddersfield, and formerly deputy surveyor for Salford, was held on Friday at Huddersfield. Debtor said that going to Huddersfield from Salford he owed £300, and had been insolvent ever since. Up to 1890 he had £500 a year, and since then £600. He had received nearly £500 in pupils' premiums, £300 from Huddersfield Corporation for extra services, and about £100 each from Wakefield, Leeds, and London County Councils. During the last three years his receipts reached £2,300. He had not made speculations, and all had gone on account of family expenses, personal illness, and the repayments of loans. His deficiency was £1,370. He ought to have filed a petition years ago, but hoped to pull through. The public examination was closed.—A large meeting of the General Purposes Committee of the Huddersfield Corporation had under consideration on Tuesday the status of Mr. Dugdale. The meeting lasted an hour and three-quarters, and came to the consideration of the matter after it had been dealt with at a protracted sitting of the Finance Committee. The result of the proceedings was that, by an almost unanimous vote, the General Purposes Committee came to the conclusion that opportunity should be given to Mr. Dugdale to send in his resignation. Whilst not a few members of the committee gave expression to a feeling of sympathy with Mr. Dugdale in his difficulties, it was evident, on the other hand, that a pretty general opinion prevailed that the proper conduct of corporate affairs and the discipline of the department more intimately concerned required that such a decision should be arrived at.

Col. J. T. Marsh, R.E., held an inquiry at the town hall, Clacton, on Friday, with reference to the urban district council's application for sanction to borrow £450 for the provision of shelters on the sea front; £2,800 for the purpose of a scheme for using sea water; and £1,250 for the provision of a town yard.

Judgment was pronounced by a final decree on July 21 last in favour of the validity of the will, dated October 2, 1896, of Mr. James Toleman, of 110, Haverstock-hill, and of 17, Goswell-road, wallpaper manufacturer. The gross value of the personality was £109,499. Large sums were bequeathed to charities.

A new building is about to be erected in Calcott-road, Brondesbury, parallel with High-road, Kilburn, to be called Calcott Court, with frontage of 140ft. The block will consist of residential flats, with extended right and left wings, designed in the Georgian style. Messrs. P. Palgrave and Co., Westminster, are the architects for the work.

At Worcester, a new Masonic hall, with frontages to St. Nicholas and Trinity streets, has been built from plans by Messrs. Henry Rowe and Sons, of that city. The chief elevation is Classic in character, and is carried out in red brick and terracotta. Messrs. J. Wood and Son, of Worcester, were the contractors.

For the erection of the new general hospital for Newport, Mon., to be built in Cardiff-road, the tender of Messrs. A. S. Morgan and Co., of Newport, has been accepted at £29,950. The architect is Mr. Richard J. Lovell, of 48, Queen Victoria-street, E.C.

The first section of the electric tramways at Dover—that from Buckland to the London, Chatham, and Dover Railway Station near the harbour, a distance of two miles—was opened by the mayor of that borough on Monday last week. The tramways have been laid out by Mr. H. E. Stilgoe, the borough engineer of Dover; while the electrical part of the scheme has been carried out by Mr. Stephen Sellon. The contractors for supplies were Messrs. Dick, Kerr, and Co., of London; while the contract for road works was undertaken by Messrs. J. H. Briggs and Co., of Blackburn.

In the case of James Sills and John George Sills (trading as James Sills and Son), of Loughborough, builders and contractors, the order for discharge from bankruptcy has been suspended for two years ending July 21, 1899.

The death is announced from Worksop of Mr. Oscar Harrison, who has been architect and engineer since 1895 to the Worksop and Retford Brewery Co., and was previously for five years the surveyor to the Worksop Urban District Council and its predecessor, the local board.

The corner-stone of the new church of All Saints, which is being erected in Devon-street, Moses Gate, Farnworth, was laid on Saturday by the Mayor of Bolton. The building will be Late Decorated in style, and will seat 586 persons. The facing materials are red brick with red Ruabon terracotta dressings. Mr. R. Knill Freeman, F.R.I.B.A., of Bolton, is the architect, and Messrs. J. B. and J. Entwistle, of Kersley, near Bolton, are the contractors.

STATUTES, MEMORIALS, &c.

FOLKESTONE.—For many years past the vicar of Folkestone (Canon Woodward) has been desirous of restoring the ancient cross in the parish churchyard, the old steps of which have remained in good condition to this day, though the shaft and cross have long since been destroyed. Opposition of a strenuous character interposed, and the intended restoration had from time to time to be postponed, but has now been accomplished, and on the 8th inst. the mayor and corporation attended in full state at the unveiling of the cross, and after the blowing of the old horn by the mace-bearer, which, according to ancient custom, was the signal for the assembling of the inhabitants at the cross, the mayor performed the unveiling with befitting ceremony. The restored cross is based upon the model of English Mediaeval crosses of the 15th century, and has been erected upon the ancient steps. The shaft is octagonal, with spreading base and richly-carved cap, above which are sculptured panels; that to the west representing the Crucifixion with the Blessed Virgin and St. John. On the opposite panel is represented the Virgin and Child, with attendant angels; whilst on the south, looking seawards, is St. Peter, the patron of fishermen; and to the north, looking towards the town, is St. Eanswith, the patron saint of Folkestone, whose image is impressed upon the borough seal. The sculptured subjects are beneath carved canopies, richly crocketed, and the whole is terminated by an octagonal spirelet, surmounted by the cross. The work has been executed in Portland stone by Messrs. Earp and Hobbs, from the designs and under the directions of Mr. S. Slingsby Stallwood, F.S.A., architect, of Reading, formerly of Folkestone.

A block of residential mansions is now in course of erection on the site of the Forge, West Ead-lane, N.W. There are to be three self-contained flats. Messrs. P. Palgrave and Co., 23, Victoria-street, S.W., are the architects.

The Star Theatre of Varieties at Dublin is being reconstructed from plans by Mr. R. Henry Brunton, of London, and will be reopened at the end of October. The contractor is Mr. Dalton, of Ranelagh, Dublin.

A Primitive Methodist Central Hall and Sunday-schools are in course of erection in Station-road, Wigan, from plans by Mr. J. B. Thornley. The buildings are Classic in design, and are faced with Accrington brickwork, and have dressings of Yorkshire stone. Mr. J. Johnson is the builder.

The construction of the proposed balcony at the Observatory at Greenwich has been sanctioned. This will give an all-round view of the sky from the building where the 28in. telescope is stationed.

The town council of Montgomery have decided to apply to the Light Railway Commissioners for an order authorising a light railway from the town to the railway station.

The town council of Ayr unanimously agreed on Monday to purchase that part of the lands of Blackburn adjacent to the sea, lying between the Low Green and Seafield, for £2,000. The object is to secure the ground for public recreation, and to extend the esplanade. It was reported that a settlement had been effected with the insurance company relative to the burning of the Town Hall, whereby the insurance company had tendered, and the works committee had agreed to accept, £9,500 for the damage done.

Barnby Gate Wesleyan Church at Newark-on-Trent, which has lately undergone extensive repairs at a cost of upwards of £4,000, has been formally reopened.

The Southport Corporation recently entered, as an experiment, into an agreement with a contractor to cart the asphalt refuse in one district, the work having for many years been exclusively in the hands of corporation workmen. After a week's experience, the contractor has asked to be released from the agreement.

At the last meeting of the Beverley Rural District Council, Mr. Ernest Piker, of Dewsbury, chief assistant to the surveyor for the county council of Lancashire, was appointed surveyor, Mr. E. T. Felgate having resigned.

The new organ now being built for Bangor Cathedral by Messrs. W. Hill and Son is to be opened on Tuesday next by Sir Walter Parratt, Mus.Doc., organist of Windsor Castle.

Messrs. E. and H. Lumley announce one of the most likely land sales of the season on Friday next at South Hayling, where residential houses are in great demand. A large marine mansion, suitable for a yacht club or hydropathic establishment, is also offered.

Old Mill, Kilburn, is to be demolished, and a block of residential flats to be erected upon the site with a return frontage to Mapesbury-road. Messrs. P. Palgrave and Co., Westminster, are the architects, and the building is estimated to cost £12,000.

WATER SUPPLY AND SANITARY MATTERS.

RHYL.—At Monday's meeting of the Rhyl Urban District Council a special committee reported that correspondence had been going on with Mr. Baldwin Latham, C.E., as to Mr. Jacob Biggs's claim of £3,504 ls. as extras and damages in connection with the new sewerage system. The committee had discussed the several items, and expressed the opinion that none of them could be sustained. As to the "delays," it was asserted that the council had good grounds for making a very heavy claim for penalties for non-completion of the works within a specified time by the contractor. Mr. Baldwin Latham had attended the meeting, and explained his position with regard to the matter. It was resolved (1) to repudiate Mr. Biggs's claim entirely; (2) to instruct the clerk to prepare a claim for penalties against Mr. Biggs.

STAFFORD.—The Stafford corporation sewerage works, which have cost £45,000, were opened by the Mayor on Wednesday. The work has taken three years to complete, and about 16 miles of deep main sewers and 11 miles of main sewers have been laid. The sewage is first treated at the sanitary depot where a destructor and sewage pumping machinery and reception tank have been erected; thence it is pumped to a farm half a mile away. This land was purchased from Lord Stafford for £11,000. Here the sewage will be treated by precipitation and filtration on the land.

CHIPS.

Lady Gertrude Rolle will this week lay the foundation-stone of the clock tower at Exmouth which is to mark the record reign of the Queen. The clock tower will occupy a good site in this rising sea resort of the West in the grounds of the Imperial Hotel, and opposite the esplanade, which is a mile long.

Seven candidates presented themselves at Tuesday's meeting of the rural district council for Stone, Staffs, for the appointment of surveyor, the salary being £150 per year. The contest lay between Messrs. Brandon, of Chebsey, and Myatt, of Moddershall, and, the voting resulting in a tie, the chairman gave his casting vote in favour of Mr. Myatt. The latter was formerly a member of the council, but resigned in order to qualify as a candidate.

The laying of the subterranean telegraphic cable, under the superintendence of Mr. W. H. Preece, F.R.S., between London and Birmingham, is being carried out with great success. Watford is the headquarters of the operations, and the cable has now been laid over nine miles on both sides. The cable contains 76 conductors, each conductor weighing about 150lb. per mile. The paper which covers the conductors is kept dry by air pumped by artificial means.

Eight architects of New York have been selected to make competitive designs for the new city college to be erected on 138th and 140th-streets and Amsterdam-avenue in that city, to cost about £95,000 to £100,000. Plans will be completed about December 1.

Turner's house at Twickenham, known as Sandycombe Lodge, Sandycombe-road, St. Margaret's, will be offered for sale by Messrs. Chancellor and Sons at the Mart on Tuesday next. According to Mr. Ruskin, the artist bought this house in 1808, and resided there till 1827; but other writers place the period of his residence at Sandycombe Lodge as from 1814 to 1826. The auctioneers assert that the house was built after designs by Turner himself. The original structure has been added to.

The Society of Miniaturists will hold their next exhibition about the middle of October at the Grafton Galleries.

The dissolution of partnership is announced of W. P. Hampton and G. Hampton, under the style of Hampton and Sons, house furnishers, decorators, upholsterers, builders, house and estate agents, of Pall Mall East, and Cockspur-street, S.W.

Estate business at the Auction Mart, Tokenhouse-yard, last week was of a very insignificant character, and although sales were held on three days, the aggregate realisation was only £6,330, the lowest recorded for some years past. The second week in September generally marks the end of the duller period, and signs of a revival of activity are already apparent. The volume of business this week has been considerably greater, and it may be expected to gradually increase until the beginning of October, when the autumn season will commence in earnest. In the provinces, the announcements of forthcoming auctions are numerous, and the prospects of a busy time seem very favourable.

The selection of a site in Greenwich Park for the magnetic pavilion has given much trouble: but one which appears in every respect suitable has been found on the east side of the observatory, at a distance of between 300 and 400 yards.

Our Office Table.

THE "house list" of members of the Society of Architects, nominated as officers and council for the ensuing session of that body, was published yesterday, in readiness for the annual meeting of the society, which will take place on Thursday, October 28th. Mr. T. Walter L. Emden, J.P., L.C.C., of 105-6, Strand, one of the vice-presidents, is proposed as president in succession to Mr. Robert Walker, J.P., of Cork, while Major F. Seymour Leslie, R.E., who has served the society for many years as hon. corresponding secretary, and Mr. Silvanus Trevail, of Truro, are nominated as vice-presidents. The older members will be pleased to see that Mr. Edgar Farran is to be asked to resume the duties he carried out so efficiently in the earlier days of the society as hon. corresponding secretary, and that Mr. Ellis Marsland has consented to serve another year as hon. secretary. The nominations of ordinary members of council are: Messrs. C. A. Basset-Smith, G. E. Bond (Rochester), William Cooper (St. Leonard's-on-Sea), R. W. Coventry Dick, Herbert J. Jones (Bristol), A. J. Lacey (Norwich), J. R. Manning, R. Lane Pearce, George H. Phillott, M.A. (Cheltenham), G. Gard Pye, T. R. Richards, and R. Frank Vallance (Mansfield).

Mr. B. T. BATSFORD's forthcoming publications include "Later Renaissance Architecture in England," by John Belcher and M. E. Macartney, the second and concluding parts; "Bungalows and Country Residences," by R. A. Briggs, fourth edition, with additional plates; "A History of Architecture for the Student, Craftsman, and Amateur," by Professor Banister Fletcher and Banister F. Fletcher, third edition, revised; "The Influence of Materials on Architecture," by Banister F. Fletcher; "Modern Opera Houses and Theatres," by E. O. Sachs, third and concluding volume; "Examples of Old Furniture, English and Foreign," drawn by A. Ernest Chancellor; "Windows: a Book about Stained and Painted Glass," by Lewis F. Day; "Alphabets: Old and New," selected by Lewis F. Day; "Examples of Greek and Pompeian Decorative Work," measured and drawn by J. Cromar Watt; "Estimating: a Method of Pricing Builders' Quantities for Competitive Work," by George Stephenson, third edition, revised; and "Repairs: How to Measure and Value Them," by George Stephenson, second edition, revised.

THE School of Art Wood-carving, Central Technical College, Exhibition-road, South Kensington, has been reopened after the usual summer vacation, and we are asked to state that one or two of the free studentships, maintained by means of funds granted to the school by the Institute, are vacant. To bring the benefits of the school within the reach of artisans a remission of half fees for the evening-class is made to artisan students connected with the wood-carving trade. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

THE classes in Architecture, Building Construction, and Modern Practice at King's College, Strand, W.C., conducted by Professor Banister Fletcher, F.R.I.B.A., assisted by his sons, Messrs. B. Flight Fletcher and H. Phillips Fletcher, A.A.R.I.B.A., will reopen on Monday, October 4. These courses are intended to furnish full information in the theory and practice of architecture and building construction, and in the application of the principles of mechanics to construction. They are also specially arranged to enable architects' pupils, assistants, and others intending to follow the profession of architecture, to prepare for the progressive examinations of the Royal Institute of British Architects, the Surveyors' Institution, the statutory examination for those seeking the appointments as district surveyor and building surveyor, also the examination for appointments in the Admiralty, War Office, Civil Service, and other public examinations. A special course is arranged for architectural students who wish to prepare for the R.I.B.A. and other examinations in one year. Gold, silver, and bronze medals are awarded to students by the Worshipful Company of Carpenters, and a bronze medal is given by Mr. Arthur Cates to the student who stands first in the third year of the college course. Full particulars will be given by Professor Banister Fletcher, 29, New Bridge-street, Ludgate-circus, E.C.

A DRAFT of the new constitution and by-laws which it is proposed to submit to the Convention of the American Institute of Architects at Detroit a fortnight hence, has been sent out, and shows that very radical changes are contemplated. The most important of these is the abolition of the present system of electing Fellows of the Institute by direct vote, and the substitution of a federal system, under which every candidate for admission to the Institute must be a member of a local society, and must make his application through a State Association, to which all the local societies in the State are affiliated. Such application must be signed by the president and secretary of the local society, as sponsors for the candidate's good character, and the State Association elects the candidates from its own territory to Fellowship in the Institute, members of the Institute from other States having nothing to do with the election except that the president and secretary of the Institute must approve and sign the candidate's application to his State Association, and may withhold their signatures if they have reason to object to the candidate.

A "PYRAMIDICAL RAILWAY" which has recently been constructed in the Marine Park at Southend-on-Sea, was inspected on Wednesday. The Marine Park, close by the sea and extending to twenty-seven acres, was purchased by the syndicate a little more than a year ago, with the idea of developing its attractions as a place of public entertainment. Built on a huge conical framework, the main supports of which are of iron, the pyramidal railway, ascending spirally, presents the appearance of a series of galleries—five tiers, diminishing in circuit towards the top. The train, however, does not run from the base upwards, but downwards from the summit, to which the cars with the passengers are first raised from the ground by a big lift in the interior of the so-called pyramid. The motive force for this and the running of the cars is a steam-engine of four horse-power in the basement. From the top the cars descend the inclined track to the ground level, and proceed in the final stage through a short "cutting" which, for realistic effect, is to be formed into a tunnel. At the end of the journey which is estimated at a quarter of a mile, and is accomplished in about a minute and a half, the cars gradually rise on a reversed gradient, and move up to the elevator, where they halt automatically. There are three rails, two outside on which the wheels run, and a central check-rail. This new development of the switchback railway was erected by Mr. W. D. Pitt.

A NEW method of laying dust on the road bed is now being tried on the West Jersey and Seashore division of the Pennsylvania railroad, being the invention of Mr. J. H. Nicol, an assistant engineer to the company. The device consists in sprinkling the ballast with a heavy petroleum oil. The quantity of oil needed is 2,000 United States gallons per mile, and the distribution is effected from special cars, shields being provided to protect the rails from the spray. The operation is effected at the rate of four miles per hour. The use of the oil in this way was inaugurated last April, and up to August over 100 miles of track had been treated on the branch named, whilst a certain amount of work had also been done on other of the company's branches. The experience gained so far shows that one application of the oil is enough for at least one season, and the road is then absolutely free from dust.

The Rev. Canon Wilkinson, D.D., opened, on the 9th inst., new Sunday-schools which have been built in Dean-street for his old parish, St. Martin's, Birmingham. A large centre hall, Gothic in style, will serve not only for Sunday schools, but for meetings and for mission services. There are, in addition, three classrooms. The work has been carried out, to the plans of Mr. J. H. Hawkes, by Messrs. Barnsley and Son, also of Birmingham, and has cost about £2,500.

The Middlesex Hospital has received a further sum of £2,000, being part of a sixth share of the residuary estate of the late Mr. David Brandon, F.R.I.B.A.

At the closing meeting of the Trades Union Congress on Friday, on the voting for the Federation Committee, Mr. H. Johnson, London, was elected as a representative of the Carpenters' trade.

In the case of Christopher Hopkins, of St. Bernard's-road, East Ham, builder, the discharge from bankruptcy has been suspended for two years, ending August 12, 1899.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Dundee Institute of Architecture. Visit to Edinburgh to inspect (in conjunction with the members of the Edinburgh Architectural Association) the M'Ewan Hall and Blackford Observatory, Craigmill Castle, Holywood, &c. To meet at Waverley Station, Edinburgh. 9.55 a.m.

THE ARCHITECTURAL ASSOCIATION, 55, GREAT MARLBOROUGH STREET, W.

NEW MEMBERS. Students desirous of becoming members of the Architectural Association are requested to apply to the Hon. Secs. as early as possible for Nomination Forms.

Students whose nomination forms have been approved by the Committee will be admitted to the Classes provisionally, pending their election.

The Classes Commence on the 11th OCTOBER at 6.30 p.m., and the Studio Opens on the 12th OCTOBER at 6.30 p.m.

Nomination Forms, together with a pamphlet containing full particulars of the Studio, Lectures, Classes, and School of Design may be obtained on application to the Hon. Secs., at 55, Great Marlborough-street, W.

SEPTEMBER 25th.—SUMMER VISIT to the Grove Hospital, Tooting (Mr. A. H. Tiltman, Architect). Members to meet at the site at 3.30 p.m. Train from Ludgate Hill to Tooting Junction at 2.54, or from Victoria to Balham at 2.38.

Members who propose to attend this visit are requested to send a postcard to Mr. S. K. Greenslade, 53, Bedford-square, W.C.

E. HOWLEY SIM, Hon. Secs.
G. B. CARVILLE, Hon. Secs.

THE SURVEYORS' INSTITUTION (INCORPORATED BY ROYAL CHARTER).

Temporary Address—SAVOY STREET, VICTORIA EMBANKMENT, W.C.

EXAMINATIONS, 1898.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of Students will be held on the 19th and 20th of JANUARY NEXT.

It is proposed to examine Candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland, and Northumberland, at Manchester, and Candidates from other counties in England and Wales will be examined in London.

Irish Candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers, and Building Surveyors (held under the provisions of the Charter), qualifying for the Fellowship and Association of the Institution, will commence on the 21st of MARCH NEXT.

English Candidates for the Professional Examinations will be examined in London.

Irish Candidates will be examined in Dublin.

Particulars as to subjects, course of examination, prizes, scholarships can be obtained of the Secretary.

All applications for the Professional Examinations, Divs. II., III., IV., and V., must be sent in before the 31st of OCTOBER, and applications for the Students' Preliminary Examination before the 30th of NOVEMBER. The necessary Entry Forms for the various Examinations can be obtained of the Secretary.

CHIPS.

Mr. W. H. Wagstaff, A.M.Inst.C.E., 57, Saltergate, Chesterfield, has been instructed to report as to the best means of sewage disposal at Bolsover, near Chesterfield.

A new National school at Edgmond, near Shrewsbury, was opened last week. The school has been built by Mr. Whittingham, of Newport, from plans prepared by Messrs. Veall and Son, of Wolverhampton, the original contract being £872, which does not include school furniture nor the fencing and laying-out of the playground.

The urban district council of Machynlleth adopted at their last meeting plans prepared by Mr. W. C. Kirby, their engineer, for the drainage of the town, at an estimated outlay of £2,800.

The foundation-stone of the new church of St. Paul, Great Yarmouth, was laid on Thursday in last week. Only the first section of the permanent building, consisting of nave and porch, are in hand under the present contract. The building will be Late Gothic in character, and will be faced with brickwork with half timber. Messrs. Bottle and Olley, of Yarmouth, are the architects, and Mr. W. Cork is the builder.

The subway at Boston, Mass., was formally opened for street car traffic on September 1. At present only the Boylston-street and Tremont House cars are using the subway, but the Tremont-street and Shawmut-avenue entrance is very nearly completed, and will be in use by the beginning of October. The contract for building the last section near the Union station has been awarded, and work started. The Transit Commissioners believe that before next summer the entire subway will be in use, and Tremont-street entirely free from cars.

The city council of Norwich decided at their last meeting to raise the salary of Mr. A. E. Collins from £600 to £800 per annum.

Mr. John Thompson, of Peterborough, has just restored the parish church of Boothby Pagnell, near Grantham, at the expense of Mrs. Thorold, of Boothby Hall, who has thus spent several thousand pounds. The architect for the restoration was Mr. J. L. Pearson, R.A.

St. Columb magistrates investigated on Friday several charges arising out of the dispute as to the alleged right of way over the Newquay Headlands. Twenty-two residents of Newquay were committed to the Quarter Sessions on the charge of damaging the property of the Headland Hotel Company. Five of the defendants were fined for assaulting Mr. Silvanus Trevail, the chairman of the company. Two others pleaded guilty to assaulting the police, and were bound over to keep the peace.

LIST OF COMPETITIONS OPEN.

Battersea—Baths and Washhouses, Battersea Park-road	£100 (merged), £50, £25	W. M. Wilkins, Vestry Clerk, Municipal Bldgs., Lavender Hill, S.W.	Sept. 22
Frinton-on-Sea—Wotton Wood-lane School (150 places)	No premium or assessor	A. R. Chamberlayne, Clerk, Station-road, Clacton	" 21
Blaenau Ffestiniog—County Police Buildings	£15 15s.	J. Morris Jones, County Surveyor, Trawstynnydd, Merioneth	" 25
Skipton—Cottage Hospital (16 beds, £2,500 limit—no assessor)	£15, £5	W. H. Dawson, Hon. Sec. to Committee, Skipton	" 30

Trade News.

WAGES MOVEMENTS.

LEEDS.—The plasterers' labourers in Leeds are asking for an advance of $\frac{1}{2}$ d. per hour. They at present receive 6 $\frac{1}{2}$ d. A conference took place on Monday evening between representatives of the men and their employers, but no settlement was arrived at. The masters complain that the men have not given them sufficient notice of their intention to make the demand. To grant such a concession, they say, would mean a serious loss, as they have entered into contracts on the present basis.

PETERBOROUGH.—A settlement between the master builders and the carpenters and joiners of the Peterborough district with regard to the rate of wages has, after nearly nine months' correspondence, been effected. The men had asked for an increase, and the masters had offered a half-penny rise to all joiners whom they considered competent. Last week four delegates met the master builders, and an agreement was signed that the standard rate of wage was to be 7d. per hour. The agreement dates from January, 1897, until January, 1900, and if any alteration is then desired a three months' notice must be given.

THE SKILLED LABOUR MARKET.—The Labour Department of the Board of Trade report that the market at the end of August was considerably affected by the continuance of the dispute in the engineering trade. On the whole the general state of employment has somewhat declined, compared both with the previous month and with the corresponding month of last year. In the 113 trade unions making returns, with an aggregate membership of 462,256, 17,440 (or 3.55 per cent.) were reported as unemployed at the end of August, compared with 2.7 per cent. at the end of July, and with 3.4 per cent. in the 110 unions, with a membership of 429,621, from which returns were received for August, 1896. The building trades still continue briskly employed, the percentage of unemployed in unions making returns being 1.2, compared with 1.3 in July and 1.1 per cent. in August, 1896. The furnishing trades remain busy. The percentage of unemployed Union members at the end of August was 1.7, compared with 1.9 in July and 2.1 per cent. in August of last year. Changes in rates of wages, affecting about 132,100 workpeople, were reported during August, of which number about 131,000 received increases and about 1,100 sustained decreases. The net result was an average advance estimated at 7d. per head on the weekly wages of those affected. The increases include about 3,400 building trade operatives.

The Mersey Docks Board have decided, on the recommendation of their works committee, to provide a 40-ton movable hydraulic crane at the new graving dock at the Canada Dock, at a total estimated cost of £10,200.

HAM HILL STONE.

DOULTING STONE.

THE HAM HILL & DOULTING STONE CO.

Incorporating THE HAM HILL STONE CO. and C. TRASK and SONS (THE DOULTING STONE CO.)

Chief Office: NORTON, STOKES-UNDER-HAM, SOMERSET.
London Agent: Mr. E. A. WILLIAMS, 16, CRAVEN STREET, STRAND.

FAMBRINI & DANIELS,
MANUFACTURERS OF IMPERISHABLE CONCRETE MASONRY FOR
CORNICES, STRING-COURSES, MODELLED PANELS, AND EVERY STONE-WORK REQUISITE.
LANDINGS and Plain or Moulded and Mitre STEPS, durable throughout.
WORKS AND OFFICES: LINCOLN.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2229.

FRIDAY, SEPTEMBER 24, 1897.

BUILDING VARIATIONS, HERE AND ABROAD.

PRACTICE in one locality or district for a long time begets a narrow and somewhat mannered style, which is noticed both in workmanship and design. Of course, the provincial or local architect suffers chiefly from this kind of restraint. He is obliged to use one kind of stone or brick, and to adopt methods of doing work under contracts or otherwise which are in use in the district. It is extremely hard to break through these methods, as he soon finds to his cost if he specifies anything that is new or that is not known by the local workmen, or even if he treats anything differently to the local manner. The builder or workman cannot turn his hand to the new method: he says it cannot be done; that it is impracticable, or he cannot get any workmen to do it the way suggested. The mason or bricklayer has been taught to lay stones or bricks in a certain way, and he is slow to undertake any new mode of building walls, and the consequence is if the architect designs any feature or detail that is not understood, he has to take the risk of any failure that may ensue. This is particularly observable in the modes of dealing with stone in stone districts, and in places where brick is more used, as we at once notice in the North when compared with South. No doubt the provincial practitioner is more restricted than the Londoner in these respects; but even London practice is limited in its choice of materials and modes of construction and treatment. In all parts of the Metropolis we find much the same kinds of house-building and business premises, mainly controlled by the use of stock and red brick, by the same specification description of making sashes and frames, of roofing, and the various other usual sorts of fittings ironmongery, and the like. Wherever we go, north, south, east, or west, from Highgate to Penge, or from Hammersmith to Woolwich, the same kind of dwellings and buildings are to be seen—we notice a general likeness everywhere: the same dingy stock-brick wall, sash window and door, slated or flat roof, chimneys, and the like. And in matters of style, detail, and ornament there is "much of a muchness" also, for we notice, with slight variations, the same treatment of doors, entrances, windows, and dressings, till we get perfectly sick of the eternal sameness and want of invention of "jerry" builders and of Philistinish architects. We cannot expect to import new materials; the grievance is in repeating the same features and details when we have often more judicious ones within our reach.

One building is differentiated from another mainly by these circumstances: (1) by its use, (2) by the materials employed, (3) by methods of construction. We may now deal chiefly with the last two of these, which are chiefly owing to local conditions. But it is worth notice that, given the same materials in adjoining countries, it does not follow that the same style or treatment is adopted. The two countries look on the materials and their mode of employment differently. Thus, stone and brick, timber and iron are used both by us and our neighbours across the Channel; but each country has its own way of using them to produce like results. And it is about this element of treatment chiefly that we may say a few words. Those countries that are most free from the constraints of tradition or style are the most successful in their use of materials. Thus if

we have been in the habit of using bricks to imitate stone or to follow a particular style, it is impossible for us to produce a brick style that is really truthful. The habit of covering our brick buildings with stucco or cement to imitate stone has made us lose sight of the proper treatment of brick. Hence we must look to Continental examples of brickwork in Belgium, Germany, and elsewhere for a proper treatment of this material. Our best recent buildings of brick have, in fact, followed these models, and have become, therefore, more Continental than English. And we may say the same of what we call Classic. As a fact, our architects have been head and hand tied to Italian or Greek traditions more than the French or the Germans have been. We used to copy Greek temples and Italian palaces, as we have examples to show; but the French capital itself can hardly show so exact a repeat (except, perhaps, the Madeleine) as St. Pancras Church is of the Greek Erechtheion and the replica of the "Temple of the Winds" in its steeple. And this is because our neighbours have learned to use their materials like brick and stone honestly, without trying to imitate details, and just why the same materials in their hands have been turned to better account.

Let us take a few of the features which differentiate English buildings from those on the Continent. The mode of treating walls of masonry is one. Anyone who has travelled at all in districts in which different local materials and workmanship exist, will have noticed the modes of using the common rubble and sandstones; of building jambs and window pilasters and architraves, of dealing with the flat surfaces of walls by stucco or otherwise. These are often thrown into panels, with stone or brickwork in the quoins and jambs, as in our flintwork. In most cases the local stone is used, as we see in Normandy, in the plinths and basements of houses. Our neighbours are fortunate in having some cheap materials and concretes. The Béton Aggloméré, patented by Coignet, and the ordinary béton employed are used largely. Their limestones are also well adapted for wall-building. The Creully stone is largely used in spire-building in Normandy and elsewhere, also in the walls of houses, and they have the knack of keeping the harder veins of rock for special purposes, and using the softer beds for walls—a practice the old 12th-century builders adopted.

In the neighbourhood of Paris we see the porous concrete or artificial stone of yellow or brownish colour largely employed for building walls of dwellings; this rough kind of walling is sometimes pointed and looks like our Kentish "rag"-work, very often it is covered by a coating of stucco and makes a good wall. Window dressings have also a character of their own across the Channel. The usual architrave mouldings returning all round the opening or plain reveals are less frequent; the dressings are, instead, plain projecting pilasters or bands of stone or brick, the wall surfaces being left of rough rubble or rough stucco. A more solid and structural character is the result of this plain frame of brick or stone round the window openings of ordinary houses, and it is certainly more satisfactory and finished in appearance than the "hole in the wall" opening, so common in English building. The window head is sometimes a plain stone lintel, straight or slightly pointed on the top, resembling a flat pediment, or it is a flat brick arch; so the window-sill in France, and in other countries like Belgium, is seldom a plain weathered slab of stone with a projecting square edge, but moulded and made a feature of interest. These differences in matters of detail, which are passed unnoticed by the ordinary observer, arrest the attention of the architect.

Everyone must have noticed the greater

prominence given to the doorway in all French cities. It is larger, and more ornamental, and the most ordinary building in Paris has an entrance which would often put to shame that of many of our City offices and banks in London. As one of the most important features of civic architecture, we may profitably note a few of the characteristic details of the doorway as we see it abroad. It is much higher as well as wider than the English doorway is as a rule—often rising through the entresol. Examples meet us in every main street or boulevard—as in the Boulevards Hausmann, St. Martin, Des Italiens, Capucins, Sebastopol, &c. In some of these thoroughfares—as in the first named—the doorway is of considerable height, the arched heads are carved in relief at the springing and keystones, and the wooden doors or gates are in two leaves, with small doors for use. The ornamentation or sculptured relief is sometimes profuse of Rococo design; but there are many examples of refined Renaissance character. And this remark extends to the woodwork of the doors. The upper panels have often well-designed frieze-decorations planted on the framing, or raised decorations in wood, more or less Classical in taste, especially in the upper portion or doorhead. The frieze-panel or attic above the casing is, indeed, one of the features which give the French doorway a decorative character quite its own. "Le Grand Roy," in his palaces, and his successor, Louis XV., both encouraged these decorative doorways and *portes cochères*. After this the ornamental doors became thin and over-refined and pseudo-Classical; but the Neo-Grec and pseudo-Roman styles still prevail. Examples of doors after Le Paultre, Puget, and Lemercier, are frequently met with in France. Le Paultre was a master of decorative doorways in the 17th century. Interior doors with attic panels of severe form and good proportion may be found. The Hôtel de Lassay, and an old hotel at Dijon, have very beautiful instances of attic panels and side panels on the jambs with rich relief carvings. The fancies of the sculptor and decorator were often let loose on these hotel and palatial doorways. At the Hôtel de Mantignon, Paris, the window-head keys are ornamented with a small piece of sculpture. The *menuiserie* became quite pliable in the hands of sculptor-artists like Harpin and Puget, in the interior doors of the period, as those of the Hôtel de Soubise, where we see a profusion of the most charming conceits, paniers, sculptured keys, panel-frames, and figures. Such monumental doors as those of the Panthéon, by Constant Dufeux, of the Library of Sainte Genevieve, designed by Labrousse, and the grand bronze doors of the Madeleine and St. Augustin are examples that are well known. The carved door-frames and centre-posts are also peculiar to Belgium and France, and many of them are very beautiful examples of art craftsmanship. To describe adequately the subject of doorways and pedimental compositions over them would require an article; we content ourselves with mentioning two or three other distinctive details which separate our own from foreign buildings. We have spoken of windows. We envy our neighbours across the Channel their ironwork in the shape of grilles and balcony railings. What dignity and security the iron grille or screen gives to the windows of the basement and ground stories! Hardly an important house or building is without external ironwork of good design. Some of them are charming examples of smithing. Then we notice the greater interest imparted to blank wall surfaces, like the flanks of high chimney-stacks and the sides of houses, by carved panel-work or modelled decoration. Surely we may take a lesson here profitably. Many of our London chimney-stacks and blank walls are large and bare enough to call for some kind of decorative treatment, and the panel-work

seen on the sides of the lofty stacks of the Louvre, Hotel de Ville, and other buildings are examples of treatment that may be followed. Unfortunately with us, our large buildings which have these blank spaces are too great a temptation to the bill-poster, who offers high rents for them to exhibit some monstrosity in the form of trade advertisements. The streets of the French capital, generally planned at acute and obtuse angles, and radiating from some great building like the Madeleine or the Grand Opéra in straight lines, suffer from the lack of variety, and in the long boulevards there is a painful sense of horizontal lines. Three or more series of balconies, added to cornices, rows of high dormers, and Mansard roofs, create an almost oppressive horizontality, compared with which our irregular lines of street and broken skylines and façades are pleasing and varied. Each has its advantages; but we should be sorry to follow the example of our neighbours. Straightness and uniformity of elevation would be dearly bought with narrow streets, without the charm of the rows of trees which make the Continental boulevard so attractive.

THEATRE-PLANNING AND CONSTRUCTION.

ONE of the few features of interest in the Victorian Era Exhibition at Earl's Court is the section devoted to theatre-planning and construction during the latter half of the Victorian era, which contains a large and representative collection of drawings, plans, and details of the leading London and provincial theatres, which have been erected during the present reign. To the able and experienced hands of Mr. Edwin O. Sachs, member of the Drama Committee of the Exhibition, and the author of "Modern Opera Houses and Theatres"—the most important treatise on the subject, which illustrates all the chief playhouses in Europe, published by Mr. B. T. Batsford, which we lately noticed in these pages—the collection and arrangement of the Architectural room has been intrusted. His special knowledge of the subject of theatre-planning and construction has been of great value in this direction, and has enabled the committee to bring together a very complete series of plans, sections, and views of the leading playhouses. Theatre construction is an essentially technical branch of architecture, and there are few architects who possess any special knowledge of the subject. The original drawings of eminent theatre architects, as those of the late Mr. C. J. Phipps, F.S.A., Mr. Frank Matcham, Messrs. Perry and Reed, Mr. Ernest Runtz, Messrs. Wylson and Long, T. E. Collcutt, and others, are to be seen, in addition to a very comprehensive series of plates published in Mr. Sachs's own great work, and to copies and prints in his own collection. A very instructive series of diagrams of block plans of London and provincial theatres and music halls, specially drawn for this exhibition, are hung on the walls. These block plans are drawn to a uniform scale of 1 to 500, so that anyone may at once compare the relative sizes of these buildings. Glancing over the series of London houses and theatres of varieties, we find the Alhambra in Leicester-square the largest in area, followed closely by the Palace Theatre, the Lyric, and the Oxford. From these block plans we naturally turn to the detailed plans themselves. Historically viewed, the three principal London theatres of the century now drawing to a close are those of Covent Garden, Drury Lane, and Her Majesty's, plans and elevations of which have been prepared by Mr. Edwin O. Sachs. These are followed by lithographic plates from Mr. Sachs's volumes representing noted London theatres built during the last twenty years, the lithographic work being executed

by Mr. Jas. Akerman. A very instructive comparative view is thus afforded of the improvements in planning and construction during this period, which it is of interest to note. Compare, for example, any of the early theatres with Mr. R. D'Oyly Carte's English Opera House, or with the Lyric Theatre. We notice, first of all, the improvements in the location, or the near approach to isolation which the new theatre possesses; the greater attention to division of the auditorium by separate walls and partitions into sections, thus facilitating a speedy emptying of the house in case of panic—a most important consideration, which the old theatre-builder seemed to disregard altogether; also the provision of separate exits to each portion of the audience. If we compare the new with the old plans, we shall be struck with the improved planning in all these points; there is complete isolation, or three sides, at least, are accessible. The auditorium is divided into separate parts, or "risks," each having its own entrances and exits. We do not mean to infer that an ideal plan has been arrived at. This is far from being the case; but these principles of planning have been kept in view. Sir Henry Irving's "Safety Theatre" plan, lent by Messrs. Darbyshire and Smith, is an ideal design shown by ground plan, circle plan, and longitudinal section, and expresses the great tragedian's views on these points. In the plan illustrating these views we find a rectangular area divided into the usual stage and auditorium longitudinally. The stalls, pit, and gallery on the lower plan are separated by partitions into sections, each having its own stall entrance, pit entrance, and gallery entrance, with pay-offices, retiring-rooms, &c., on one side of auditorium, and immediately giving access to each section, and on the other side correspondingly placed are the exits and retiring-rooms for each division. The stair entrance to upper circle is located at the short side or back of the auditorium, also the exit. In the section we see the dress and upper circle arranged in one inclined gallery, each separated from the other, the object of which is to reduce the height of audience above the street level. Two separate exits to each section of the audience is given. In narrow and confined sites, it is impossible to follow these latter suggestions, and the idealist in theatre planning has not found a large following by our London theatre architects and managers. Several of these schemes are before the public, a few of which we have noticed at various times; but the "ideal" site has not yet turned up at the right time and place. The New Theatre Royal, Exeter, by Messrs. Darbyshire and Smith, situated on a site bounded by streets at a sharp angle, follows Sir H. Irving's plan. There are three entrances in Longbrooke-street to the second circle, amphitheatre, and pit, also exits, and the main dress circle entrance is at the acute corner. The same architects' "Manchester Palace Theatre of Varieties," illustrated by plans of the different levels and sections, indicates a departure from the old plan. The auditorium is a wide semi-octagonal area, with promenade round it a large foyer, and the building is isolated on three sides. Mr. C. J. Phipps's Theatre, Wolverhampton, shown by area and first tier plans, also exhibits a wide auditory 70ft. wide, and a well arranged plan of entrances, &c. One of the main conditions of a safe theatre is the avoidance of considerable height in the seating of the audience. This condition is exceedingly difficult to observe in a London theatre on a small site; but there are a few recent theatres—as one at Dalston—which show improvement in this respect, avoiding the break-neck upper gallery and amphitheatre. One of the last of the late Mr. Phipps's works was Her Majesty's Theatre, and we have here, besides a view, plans of area, first tier, &c. We recently gave the exterior design of this building in

the BUILDING NEWS of May 14 last. The auditorium and stage occupy the inner area of the rectangular site. Towards the Haymarket is a spacious vestibule with pit, first and second tier, staircases, and other entrances and exits on the return side. A large theatre of varieties is the "Colosseum," Dalston, from the designs of Messrs. Wylson and Long, who contribute plans of the Oxford Music Hall, one of the latest and best, the Empire Theatre, Bristol; the Lyric, Bath; Winter Gardens, Blackpool (which is shown in colour detail and a large model of the decoration); the Empress Theatre, Brixton. The Colosseum has a large auditorium, and the audience is confined to a balcony and gallery—a decided improvement on a number of superimposed galleries.

The lithographic plates of London theatres include, besides Mr. R. D'Oyly Carte's New Palace Theatre of Varieties, which we have illustrated, Daly's Theatre, with three tiers; Garrick Theatre; Grand Theatre, Islington; Lyric, and Trafalgar Theatre; also those of Wolverhampton Grand Theatre, Leeds, Cambridge, and the Shakespeare Memorial Theatre, Stratford-on-Avon, by Mr. F. W. Unsworth, which was fully illustrated in the "B.N.," besides plates of several music-halls: the Alhambra Theatre, by J. Tavenor Perry and F. H. Reed; the Empire Variety Theatre, Palace Theatre, Manchester; Oxford Theatre, London. All these plates are from Mr. Sachs's work. The series of photos. representing these and other theatres of London, the valuable collection of plans designed and executed under the supervision of Mr. Frank Matcham, including the Lyric, Hammersmith; Empire Palace, Edinburgh; Theatre Royal, Bolton; Grand Theatre, Islington; Canterbury Music Hall, Grand Theatre, Blackpool; Opera House, Wakefield; Alhambra, Brighton, and a dozen or two others, and the late Mr. Phipps's drawings, make a valuable historical series of this branch of design.

Examples of modern theatre construction in its latest development will be found of interest. The drawings and details of the iron and steel cantilevers and roof-trusses of Mr. D'Oyly Carte's Palace Theatre show the great advances made in the fireproof construction of this class of buildings. Here we have drawings showing the radiating cantilevers and cross-beams and stanchions of the dress circle and second circle, also the main girders of roof and gridiron floor over stage. In the Alhambra Theatre, and in several new houses, the same framework construction covered with concrete has been introduced. These details have been prepared by Mr. Sachs from the working drawings of the Horsley Iron Company. We also notice large sections and detail drawings of the stage and hydraulic bridges of the Lyric, executed by Clark, Bunnett, and Co., Ltd., and the fire-resisting curtain 32ft. between grooves of iron stanchions, and 27ft. in height. The plan of hydraulic bridges and stage shows five of these bridges, the back one travelling from cellar to 10ft. above stage, and the others to stage floor. The United Asbestos Company show a model of a fire-resisting curtain (Max Clarke's patent), constructed by Messrs. Clark, Bunnett, and Co. for the Lyric Theatre. This is framed with L-iron, and is supported by counterweights which slide in grooved iron uprights; it is covered with asbestos cloth. Messrs. Strode and Co. contribute diagrams of appliances used for stage-lighting where gas or electricity is employed. These show arrangements of gas-cocks, of footlights for gas installations, gas batteries, side-lights, float-lights for electric installations, &c. Other stage details are exhibited by Mr. Edwin O. Sachs; also a few models—one of the Empress Theatre at Earl's Court, the largest, probably, in Europe, with its enormous iron-braced roof of segmental shape. Architects who visit Earl's

Court Exhibition will also find much in the admirable reproduction of an English town, entitled "Picturesque England," carried out by Messrs. John Barker and Co., of High-street, Kensington. In one of the quaint half-timbered buildings, Messrs. Doulton and Co., of Lambeth, exhibit some fine faience, and pottery in the course of manufacture. The architectural details and features of the brick, stone, and half-timber buildings of the 16th and 17th centuries are exceedingly well reproduced.

THE SANITARY CONGRESS AT LEEDS.

WE continue and complete our report of the well-attended and successful congress at Leeds of the Sanitary Institute, from our last issue p. 393, with a notice of some of the papers read at the end of the week.

THE SANITARY ASPECTS OF WOOD PAVEMENTS.

A paper having this title was read by Mr. Charles Mason, of London, before the conference of Municipal and Sanitary Engineers, Mr. Thomas Hewson, borough engineer of Leeds, in the chair. The author held that most of the adverse criticism bestowed upon wood as a paving material was due to careless and improper methods of laying and subsequent maintenance rather than to the material itself. Wood, if properly selected and treated and thoroughly well laid, had advantages which should favour a continuance of its adoption as a carriage-way pavement until some better substitute had been discovered. Asphalt was undoubtedly the most sanitary of all materials for street pavements, but its general adoption on other than comparatively level roads was practically prohibited until horse haulage became a thing of the past. The life of a wood pavement varied from five to twelve years, according to the amount of traffic, quality of wood, and method of laying. The unsatisfactory method of laying and maintaining wood pavements, coupled with the fact that renewals were not sufficiently frequent, was mainly the cause of complaints as to the insanitary condition of wood pavements; of course, excepting a faulty system of scavenging, which could easily be remedied. From an experience of seven years in the construction and maintenance of wood pavements in London, he had arrived at the conclusion that wood pavements were condemned on sanitary grounds because—1. Too little attention had been given in the past to the contour of the road to allow for a natural fall to the gullies. 2. The wood used had in many cases not been carefully selected and properly treated with a preservative. 3. The expansion joint in each channel was allowed to become a source of nuisance. 4. Repairs had not been carefully executed, and renewals had not been made at frequent intervals. 5. An inefficient system of scavenging had been allowed to exist. The hard woods mostly used for street-paving works were those known as "Kauri" and "Jarrah," from Western Australia. They were generally laid close-jointed, and grouted with pitch and tar, and formed an excellent sanitary pavement. Their liability to contraction, however, had proved a drawback, as the spaces left between the blocks when contraction took place became filled with road detritus, which it was impossible to get out. The essentials for a satisfactory wood pavement were—a properly-constructed roadway, careful maintenance and frequent renewals, and good scavenging. Wood was suitable for town pavements, on account of its being less noisy and less slippery than any other kind of pavement used for heavy traffic. In order to overcome the objections mentioned, all soft woods should be carefully creosoted (in vacuum, and not simply dipped), the blocks laid "close-jointed" to a proper contour both transversely and longitudinally, and grouted with bituminous composition. The blocks when thus laid did not expand more than was requisite to bind the whole pavement together. Wood blocks thus laid and cleansed by periodically washing formed as perfect a pavement for carriageways as it was possible to obtain.

In the discussion that followed, Mr. Price, city surveyor, Birmingham, remarked that in his city they had no hard wood pavements, but they had a large and rapidly-extending area of soft wood pavements. He quite agreed that the scavenging of wood pavements must be efficient if they were to be kept in a really healthy condition. The

Birmingham roads were swept and watered every night. Mr. R. S. Rounthwaite, surveyor, Sunderland, said he had found hard wood pavements very slippery, but apart from that consideration, they at Sunderland had had wood pavements which lasted from eighteen to twenty years. He thought soft wood blocks the safer. Mr. Mason favoured the blocks being put directly on the concrete. He thought it better to put a thin layer of sand under the blocks. Mr. Cox, Bradford, favoured the hard wood blocks. They were certainly a little slippery in wet weather, but if the street was fairly level, there was not much danger in that direction. He did not agree with Mr. Rounthwaite as to the method of laying the blocks. On the other hand, he had experienced no difficulty in making the concrete foundation perfectly fit for the reception of the blocks without any intermediate layer of sand. Mr. White, Folkestone, thought soft wood blocks did not compare at all favourably with the hard variety. He had not found the hard wood pavement slippery. Sometimes steam rose from soft wood pavements, which was not very healthy. That never occurred with a hard wood road. Mr. Mason, replying, said the point which he wished to emphasise most was that wood pavements, to be healthy, needed careful and systematic scavenging and frequent renewals. The life of a pavement, as he had said, depended entirely upon the traffic passing over it. The wood pavement in the Strand only lasted from four to six years.* He had found no difficulty in laying the blocks directly upon the concrete bed. They were cut by machinery, and were all the same size. The chairman (Mr. Hewson) said the paving of streets in the centre of a large city was a serious matter. He did not think any authority was justified in putting down a pavement which would not last at least seven or eight years. They must consider the tradesmen, who were paying enormous rents. It was too bad to pull up the roads in front of their premises every three or four years.

THE DISADVANTAGES AND DANGERS OF COMBINED DRAINAGE.

Dr. Bushell Anningson read a paper on this subject, in which he pointed out in regard to the disadvantages of combined systems of drainage, that the definitions of the terms "drains and sewers" of the Public Health Act, 1875, had, by throwing the responsibility of the maintenance of such systems upon the local authority, led to serious drainage difficulties in regard to the repair of defects in old parts of town communities, and in the development of building estates in newer parts of towns, and in the measures necessary for the diversion of sewage from the natural watercourses under the Rivers Pollution Prevention Act, a result due mainly to the natural reluctance of local authorities to charge upon the public revenue moneys for what in fact was an improvement of private property and a relief to owners of unhealthy houses. Mr. Anningson pointed out that in practice these combined systems, while being treated legally as sewers, were physically treated merely as drains. The several contributory houses were allowed to be connected thereto without interceptors and ventilating shafts, such as would be insisted upon in respect of a recognised public sewer. He remembered instances in which the poison of typhoid fever had been conveyed from one household to others adjacent along the line of the common conduit; and suggested that under the existing legal difficulties the best remedy would seem to be to treat the common conduits as real branch sewers, and disconnect each contributory house by an air interceptor and ventilating shaft of its own.

Mr. Lewis Angell, borough engineer, West Ham, said the corporation of that town had had hundreds of miles of drains, which formerly were considered as private drains, thrown upon its hands to repair and maintain, under the new interpretation of the law. It was held under the old interpretation of the law that these combined drains were private drains, but, as was not uncommon, a lawyer had driven a coach and horses through the Act of Parliament, and it had been held that the drains were public sewers. A clear definition of the terms "drains and sewer" was needed.

THE PROGRESS OF SANITARY WORK.

Dr. T. Pridgin, F.R.S., in opening the section devoted to the discussion of Sanitary Science and Preventive Medicine with an address,

* And always stinks.—Ed. B.N.

contrasted the growth of public opinion on sanitary matters during the past quarter of a century. He pointed out that many points then urged, almost as if open to doubt, or, at any rate as needing strong arguments to compel acceptance, now "went without saying"; that forecasts as to the possibility of diminished death-rate under improved sanitary conditions had been fulfilled; and that the public conscience had been awakened to the necessity of securing improved conditions of living, not only in the great towns, but also in villages and scattered hamlets. What was then almost sanitary chaos was now, as far as legislative plan was concerned, bit by bit being reduced to order; and the possibility had been established of such order reaching every corner of the country. Much remained to be done. Many people might feel that the progress of sanitary work had been slow. He thought they might maintain, looking back 25 years, that it had been great. It had probably been quite as rapid as was desirable for real progress. About 25 years ago the Legislature for the first time provided that there should be medical officers of health throughout the whole kingdom. When that Act came into force, medical officers had to be appointed, the majority of them having had no previous training whatever in sanitary work, and sanitary inspectors had to be appointed in the same manner. But the work had trained and developed both medical officers and sanitary inspectors, and now the nation required, for the position of medical officer, a man very highly trained, and who had given proof of the training he had undergone. In the same way, sanitary inspectors almost entirely—there were some exceptions—must give proof of a very considerable amount of training. All this was progress, and it was progress based upon public opinion supporting and sanctioning it.

DISINFECTION.

Dr. Spottiswoode Cameron, the Leeds Medical Officer, introduced the subject of disinfection, and explained the methods carried on in Leeds. Professor Delepine said he had found that a most efficacious method of disinfecting rooms was to wash the walls with a solution of bleaching powder. Mr. H. Kenwood followed with a paper on the disinfection of rooms by formic aldehyde vapours. By means of a model which he exhibited, he illustrated a handy method of disinfecting by this means. The cost of disinfecting an ordinary sized room would, he said, be under sixpence.

ENGINEERING AND ARCHITECTURE.

In opening the section dealing with these subjects, Mr. Lewis Angell, the president, said the most striking feature of the Victorian era had been the development of the practical and useful. It was not until the reign of Victoria that the profession of the civil engineer came into existence, and they had now arrived at a condition of nil admirari, and become as gods "directing the great sources of power in Nature for the use and convenience of man." Engineering and architecture represented the constructive side of sanitary science. The science and the laws of sanitation were now well known and established, and all he could hope was to drive home old-established truths by repeating line upon line and precept upon precept. Upon the general engineering principles of town drainage, engineers were in the main agreed. The English water-carriage system was accepted as the cheapest, most efficient, and least objectionable, and was universally extending, and would ultimately extend to every civilised town in the world. The history of sewerage revealed erratic procedure. Sewage was 30 years ago declared to be a "mine of wealth," if applied to land. Sewage farms had had their day, however, and chemists, patentees, and stockjobbers had failed. The question had now taken a new and interesting biological aspect. They were harking back to first principles, to the engineer's tanks and the resurrection of the microbe hitherto killed by the chemist with his patents and reagents. Probabilities indicated that microbes worked for good and evil, and that the good would prevail; that the purification of sewage would be effected by living organisms. Referring in detail to sewer ventilation, the president declared himself in favour of free and open ventilation. The cardinal conditions of health—pure air, pure water, and unpolluted earth, with the accessories of wholesome food, proper clothing, and suitable houses—the necessities of life—comprised the whole gospel of sanitation. In our own habitations

there should be ample means of ventilation in all living-rooms, no connection between the dietetic water supply and the drains, no connections with the sewer except for the discharge of sewage, the drains should be trapped outside and freely ventilated, and all discharges from cisterns, baths, &c., should be in the open air. The president commented on the decision of the Queen's Bench, by which the term "public sewer" applied to every description of drain and sewer except drains used for the drainage of one building only, or premises within the same curtilage. The Lord Chief Justice might well have said that the condition of the sewer laws was a scandal. Several recent attempts had been made to put the law on a more equitable basis, but the Bills had been invariably blocked in the interests of property-owners. There was, however, a Nemesis in all this. The local authorities of the past would not provide the small staff of inspectors necessary for the proper supervision of buildings and house drainage, and unprincipled owners and "jerry" builders could on their own premises do very much as they pleased. The local authorities had now to provide not only a large staff to discover the defects of the past, but, at a great cost, to remedy the bad work which could have been prevented by proper supervision. The housing of the working classes was a prominent feature in sanitation. Whether this should be accomplished by flats or by workmen's trains was a matter for serious consideration. Much good had been effected in the Metropolis by the clearance of unhealthy slums and the substitution of piles of tenements, but it was questionable whether it was desirable to concentrate the working population on so limited a space, with only street gutters for the children's playgrounds. With the facilities now given by the very cheap workmen's trains and trams, it would be infinitely better to distribute the population. The requirements of the model by-laws of an open space—relatively small though it be—at the rear of houses, and a specified width of roadway in front, precluded the repetition of the old courts, alleys, slums, and rookeries, as also the very objectionable back-to-back houses, which, unfortunately, continued to exist in many towns which could be named. After referring to the disposal of storm-water, and the proper dimensions of house-drains, he said: Sanitary principles, they were told, if carried to their logical conclusion, would prohibit carpets, tapestry, curtains, architectural mouldings, and reliefs—anything, in fact, which could harbour dust and dirt in houses; walls should be smooth, polished, and without angles. In food, people must so study what to eat, drink, and avoid, and by an all-round anxiety to preserve health render life not worth living. There was the happy medium in all things which wisdom dictated. Small local practitioners took up sanitary shibboleths, and dogmatically ascribed to sewers, gullies, or ventilators illnesses for which they could not otherwise account. Even those from whom they expected more science frequently gave their dicta without taking the trouble to investigate. Typhoid and diphtheria were generally ascribed to sewers and drains, but nearly every large outbreak of enteric fever had, upon careful scientific investigation, been distinctly traced to contaminated milk or water, and not infrequently to shell fish, while diphtheria had been ascribed to personal contamination in schools. The municipal engineer should have had a liberal education to safeguard him against the narrow motives and influences by which he was surrounded. He should be something more than a sanitary "expert." He should have practical experience in general engineering. At present the office of engineer was open to any brassplate man, who could obtain responsible official positions upon the mere testimonials or votes of good-natured friends. The Sanitary Institute, as also the Association of Municipal Engineers, had established examinations to test the knowledge of aspirants for public offices. Such examinations might not be an absolute proof of general fitness, but as an examiner he said they afforded *prima facie* evidence that the candidates who passed were not mere quacks, and local authorities would do well to require diplomas or certificates before making an appointment. It should not be competent for anyone not holding a qualifying certificate from some recognised examining board to present himself as a candidate for any of the higher municipal offices. Subject to such evidence of qualification, local authorities might have the selection and appointment of such officers; which

appointment, subject to good behaviour, should be as permanent as in the Civil Service, carrying with it superannuation.

FEVER HOSPITAL CONSTRUCTION.

In a paper on this subject, Mr. Edwin T. Hall, F.R.I.B.A., of Moorgate-street, E.C., reminded his audience that the organised attack on smallpox, scarlet fever, diphtheria, &c., was the outcome of the latter half of the Victorian era. Even in the county of London no hospital specially set apart for scarlet fever existed until 1849, when the London Fever Hospital was opened; and in the country generally local authorities first derived their power to provide hospitals for infectious diseases under the Sanitary Act of 1866. When public infectious hospitals were first constructed in England it was common to devote a part of the site to smallpox and another part to all other infectious diseases, one set of staff quarters being common to both. It was, however, found that the danger from smallpox was great, not only to the sick patients in other parts of the hospital, but to the surrounding district, and separate hospitals were instituted for smallpox. In London, the Metropolitan Asylums Board in 1885 came to the momentous conclusion to abandon land hospitals for smallpox, and to establish hospitals on the Thames at Darent. The happy result followed that the disease had been practically exterminated in the Metropolis. The value of isolation was shown in a remarkable degree, and it was demonstrated that the fast-travelling tide of the river caused, by friction, movement in the air even in the calmest days sufficient to carry away and oxygenise heavy gases. In any scheme of hospital construction for a town too much stress could not be laid on the necessity for an ambulance station and an organised ambulance service. On the question of the maximum size of an infectious hospital, he had not been able to find any data to prove that any limit need be set. Given an adequate area of land and an adequate staff, a hospital might be of any size. The site for any hospital should be as open as possible. If one could be found surrounded by roads, it would be better, because all roads were channels for wind currents. It should be on elevated ground, so that drainage might be readily carried away, and should be as compact as possible. Much had been said as to the maximum number of patients per acre that should be put on the site, but he was not aware of any data that justified any one of the arbitrary figures suggested. The area required should be determined first in regard to the facilities which naturally existed for a rapid change of the surrounding atmospheres, and next, the necessity for a zone between the infected buildings and the boundaries. The one-storied hospital was the medical ideal, but the practical suggested and permitted of the two-storied pavilion. There should be two entrances only to a hospital—one for the staff, patients, and stores, and the other for the hearse, coffins, &c., the latter being so placed that it was out of sight of the patients. Having described the internal arrangements of several large hospitals, Mr. Hall then said the factor first to be considered in planning was how many patients should be put in a pavilion. In cases of scarlet fever, it was considered by medical men most economical, from the nursing point of view, to have not less than fourteen in a ward. The Asylums Board had fixed the number at twenty, and they might well accept that as a good rule for a large hospital. The best height for a ward from a practical point of view was 13ft. Any greater height was not aerially of any value to the patient, and any less height in a large ward looked oppressive. It was of great importance to insure a uniform temperature to all parts of a pavilion, and he believed the best form of heating was by low-pressure hot-water radiators beneath windows. He deprecated horizontal pipes around the walls of a ward, and those in trenches were not to be tolerated at all. It was far better to put all horizontal pipes in the open basement beneath the pavilion. There should, in addition, be central fireplaces, which gave cheerfulness to the room, and were most valuable extractors of foul gases. In his judgment, a central stack was much better for an infectious ward than a stove with horizontal flues carried to the external walls. He believed in the artistic treatment of a ward as a refining influence as well as a curative value to patients, and thought that the surface of the walls of a ward should be of impervious material, faced with Parian, Keene's, or Robinson's cement, painted in various artistic colours to rest and

please the eye. In addition to the ordinary pavilion of a hospital, there should be isolation pavilions, for the reception of cases of which the diagnosis was not certain. After dealing exhaustively with the fittings of a hospital, he said he would recommend as the motto for the inside of an infectious hospital, "Let nothing be hidden." In conclusion, he urged on all local authorities the desirability of making their hospitals architectural in treatment.

SANITARY ADVANCES IN MUNICIPAL ENGINEERING.

A lecture to the members of the Congress was delivered on Thursday evening by Mr. H. Percy Boulnois, M.Inst.C.E., the city engineer of Liverpool. The author called attention to the multitude of subjects which a city engineer was expected to know something about. These included, amongst many others, sewerage, bridges, water, road-making, tramways, street lighting, architecture, surveying, and building. Municipal government theoretically was splendid; practically, it often failed. It failed principally because that government was ever changing. As each succeeding November came round fresh men took seats on the controlling bodies. The consequence was that the municipal engineer had no sooner educated one committee to a proper standard than he had to start to educate another. This was very much against advancement. Then, again, in small towns men got into municipal bodies for purposes of their own. Sewerage used to be exceedingly defective. The drains were badly constructed—mere elongated cesspools. But the municipal engineer had changed all that. He had properly graded the drains, and consequently large communities were now able to live together with almost perfect immunity from disease. He drew attention to the difficulties experienced in insuring that sewers shall be self-cleansing, and described the various methods of flushing which have been adopted. He likewise explained in detail the question of sewage disposal, and pointed out the advances which had been made in this direction, giving a brief description of the latest advance under this head, what was known as the septic system, where decomposition was allowed to proceed in tanks under safe conditions, and the effluent passed through filters. He strongly advocated the use of refuse-destructors for dealing with the enormous accumulations of house and trade refuse which had daily to be collected in every large city throughout the country. Respecting sanitary road-making, he pointed out that a properly paved roadway upon a good bed of Portland-cement concrete was impervious, and absolutely sanitary, whereas a macadamised road for busy traffic was unsuitable on account of its porous nature. A street efficiently paved with Australian hardwood approached as nearly as possible perfection in street-making. Mr. Boulnois concluded with a reference to the debatable question of the housing of the labouring classes. The class of persons for whom the benefits of the various Acts of Parliament were intended were the "labouring" classes, and not the "artisan" classes, who had better wages, and could afford to live in houses provided by private enterprise. For the labouring classes, whose wages were precarious and sometimes very small, it was essential they should be housed in cheap houses, at a rent of about one shilling per room per week, and that these houses, though sanitary in every respect, should not be made too attractive, or they would induce the artisan classes to occupy them who could afford a dearer class of house. Such houses could not be built on the ideal as to how these people ought to live. It was this higher ideal which had practically prevented the benefits which should have been derived from the various Labouring Classes' Dwellings Acts being enjoyed by the classes for whom they were passed. In Liverpool cheap houses were now being erected by the corporation, which were letting as fast as they could be erected at 1s. 3d. per room per week. The net return from these houses would be nearly 5 per cent. per annum on the outlay.

OUR SUPPLIES OF WATER.

The members of the section for Chemistry, Meteorology, and Geology met at the Municipal Buildings, Mr. W. Whitaker, F.R.S., presiding. In his opening address, Mr. Whitaker remarked that whilst years ago there were various wonderful theories accounting for the occasional outflow of water, these outbursts were now known to be merely owing to the rise of the underground

water level after seasons of heavy rainfall, until it became an overground one along the bottom of the valley. In the course of the past session of Parliament two Bills promoted by the corporations of Nottingham and of Newark had a somewhat lengthened consideration in Committee of the House of Commons. This inquiry had some peculiar features. In the first place there was not a single company in the case; but there was a multitude of corporations and of other local authorities, opposing the whole or part of both Bills. A second peculiarity was the absence of chemists, an occurrence previously unknown in such a case. The fact was that no question of quality arose. In both cases the new red sandstone was the source of supply involved, and by means of wells. In each case the promoting corporation asked for a protective radius; really a ring within which no other works for public supply should be established, their own works being, of course, the centre of the circle. One of the two schemes was for the supply of a population of 20,000, while the other was for a population nearly fifteen times as large. The smaller scheme asked for the larger radius (four miles), and to have it for nothing; the result being that finally the application was unsuccessful; whilst the larger scheme asked for a smaller radius (two miles) and got it, by paying for it.

AIR POLLUTION IN TOWNS.

A paper on this subject was read by Dr. J. B. Cohen, of the Yorkshire College. He said pure water and wholesome food had so long been recognised as essential to the general health of the community that they now claimed the strictest supervision on the part of every municipal body. It seemed remarkable, therefore, that the air, the consumption of which exceeded in weight five times that of liquid and solid food, should be subjected to no more searching test than that furnished by the daily meteorological record, which gave no information as to its purity at all. Yet it was much more important to know the extent of atmospheric pollution than its temperature, pressure, dampness, or the direction of its currents, however valuable they might be. If a daily record was kept of the bacterial condition of the air, in addition to its temperature and pressure, they would have some direct evidence of its purity in different parts of a town, and, granted that the experience of others confirmed his own, they would find that the bacterial conditions would be a fair test of the sanitary condition of the places in question. Smoke was another source of pollution of a town atmosphere. He doubted whether anyone would care to dispute that health was affected by a smoky atmosphere. No one could dispute the fact that the discomfort and dirt arising from the smoke were very great. The problems they had to face were, how to purify the atmosphere from its bacterial impurities, which arose from overcrowding and insufficient sanitary accommodation, and from the smoke. Those problems, like that of river purification, were rendered particularly complex, not from any inherent difficulty, but from the fact that long habit and a deplorable want of foresight had shackled them with "vested interests." To begin with, boiler chimneys, which were accountable for much smoke, required some more rigid and intelligent system of inspection. Smoke inspectors should be empowered to advise, and the adviser must be a man who knew his business. The domestic hearth was more difficult to deal with. If gas was charged at a rate more nearly approaching its cost, its consumption for heating purposes would be more general. From a careful study of the subject, he felt in a position to state that gas fires, judiciously used, were thoroughly healthy and efficient heating appliances.

THE HOUSING OF THE WORKING CLASSES.—BACK-TO-BACK HOUSES CONDEMNED.

In a paper on "Operating the Housing of the Working Classes Act in Leeds," read on Friday, Mr. George F. Carter, A.M. Inst. C.E., Assistant-Engineer (Sanitary Areas), Leeds, the writer dealt in detail with the York-street and Camp Field insanitary areas, and the steps which were being taken by the corporation to clear them. It was proposed, he said, to deal with the York-street area as follows:—The buildings on the first section of the area would be demolished, and dwellings afterwards erected for the accommodation of 500 persons of the working-class. The second section would then be cleared, and provision made for another 500. Then the third section would be

dealt with, and provision made for 1,000, or, in all, a total provision of 2,000 persons of the working class. Afterwards the fourth section would be cleared. It was not intended that all the accommodation should be in the area itself. The committee had determined to arrange for the erection of about 100 houses (to accommodate about 500 persons) upon a part of the Ivy House Estate, belonging to the corporation. The type of house it was proposed to erect would comprise a good-sized kitchen or living-room, a scullery with copper fitted in, two good bedrooms on the first floor, an attic, and a cellar for food and coals, or an outside pantry. Each house would have its own back yard, w.c., and ashpit. With regard to the remaining 1,500 for whom accommodation must be made, a great question opened itself out, as some effort must necessarily be made to supply suitable accommodation for the very poorest class. There was great need in Leeds for some really good common lodging-houses, where, for about 4d. or 5d. per day, a person could have the use of a private cubicle to sleep in, and it had been suggested that the corporation should erect such a lodging-house to accommodate about 500 persons. It was proposed to accommodate the remainder of the people displaced in tenement dwellings and specially arranged through houses on the area. The ordinary tenement blocks would not exceed four stories in height. Mr. Carter also described the measures that are being taken with reference to the Camp Field area. Dr. Muntz, of Belfast, said he was pleased with the paper because it showed that, while the Leeds Corporation seemed to be totally behind the age as regarded back-to-back houses, their officers were in the forefront of sanitary information. He was glad to see that the Local Government Board would not permit the corporation to erect back-to-back houses in place of those to be demolished. They would always find it better to take a small area in hand rather than a large one, because they would so reduce the opposition they had to encounter. It was desirable to drive one long street through such an area, but it was a fatal mistake to make it too wide, because if they did so they would spoil it for shop purposes. In one case in which he was concerned they widened a street to 65ft., but it would have been better to make it 55ft., because, when wider, it became practically two different streets. Generally speaking, the main street should be of such a width as to take in a double line of tramway, with sufficient space for ordinary traffic on either side. Dr. A. T. Gordon Beveridge (Aberdeen) said his objection to the corporation scheme was that it was not large enough. If they could remove the displaced population to the outskirts of the city, they could give them better accommodation than would be possible in the centre, and they would avoid the introduction into Leeds of the odious Scotch system of huge tenemented houses. They would also place their scheme on a more sound financial basis. It was a mistake to suppose that the tenants they were going to accommodate were necessarily those they evicted from the slums. In many cases it was found that the artisans who took the new dwellings were of a class higher than those evicted from the slums, and that the slum-dwellers removed into the somewhat better houses vacated by those who went into the new artisans' dwellings. They thus got the whole of the lower stratum of the community lifted up a step. Councillor W. S. Brown (Edinburgh) said that in dealing with a scheme similar to the one now under consideration in Edinburgh, the first step they took was to have a careful supervision of all licensed lodging-houses in the city. They insisted on their being put into proper sanitary condition, and where they were not so they closed them forthwith. They next served notices to acquire the property to be dealt with, and, after trying various methods, they had come to the conclusion that the best and speediest method was at once to put the matter into the hands of the arbitrator appointed by the Local Government Board. A company was formed which purchased a large tenement for a model lodging-house to accommodate upwards of 300 persons. That was five years ago, and up to now they had never paid less than 5 per cent. They charged lodgers 4d. each per cubicle per night, and made a reduction when a week's tickets were purchased. In Leeds, as in Edinburgh, there must be individuals willing to form companies, and in this way, perhaps, relieve the corporation from the burden of putting up common lodging-houses. Councillor Womersley said, with reference to back-to-back houses, that

there was no comparison between the older specimens and those more recently erected. He would ask their critics to try and realise what it meant to have to deal with 72 acres of land in the centre of a great city like Leeds, and to house and re-house 15,000 people. The feeling of the corporation was not to interfere with private enterprise. Ald. Harrison, Chairman of the Health Committee, Sunderland, said that his corporation, in clearing an insanitary area, divided the work into three portions, and proceeded by steps. They instructed the borough engineer to value the whole of the property involved, and then had an independent valuation made by an estate agent. The two were found to correspond very nearly, and the committee therefore placed the matter in the hands of the agent with instructions to acquire the property at as near his own valuation as possible. He secured a considerable amount, some at less, some at the valuation, and some at a little more, and they had now bought the whole property at a fairly considerable sum less than the original valuation. They submitted plans to the Local Government Board, and this placed them in a difficulty, for while on the one hand their effort was to do away with insanitary overcrowding, the Local Government Board insisted that the whole of the people displaced should be provided for on the area cleared, and they were driven to erect those high buildings that none of them liked. Their plans only showed three stories, as against the four required, and the Local Government Board had not yet sanctioned them, because they were unable to house the whole of the people on the area. That was a strong argument in favour of the local authority having absolute discretion in such a matter. Dr. Walter Smith spoke of a similar condition of things at St. Pancras. They had a very large scheme before them, and the Local Government Board refused to allow them to go on unless they rehoused three-fourths of those displaced, and that was absolutely impossible, because every inch of ground for miles around was covered.

THE TREATMENT OF SEWAGE.

In the section of Engineering and Architecture five papers were read on Friday dealing with the treatment and purification of sewage. "The Scientific Basis of Sewage Treatment" was the subject of a paper prepared by Mr. W. J. Dibdin, F.C.S., and Mr. G. Thudichum, F.C.S., and read by the former. In all methods of sewage purification which had been previously employed, final oxidation had been effected, although this had failed to be generally recognised. The best and most natural system hitherto tried—namely, the application of sewage to land—depended for its success entirely upon the fostering and increase of micro-organisms. But the use of crude sewage upon land led to great difficulties, and in consequence previous chemical precipitation had been resorted to. It had not been seen that the same agencies which destroyed the dissolved impurities could, if given the necessary conditions, equally deal with those in suspension. Hence came all the numerous chemical schemes, with their inevitable accompaniment, sludge. With the clear effluent it was possible to deal, although the process, being dependent so much upon local conditions and climatic influences, was always uncertain; but the sludge always remained, the bête noir of all those concerned in sewage disposal. In the recognition of the fact that all processes of sewage purification must be made subservient to the requirements of the various micro-organisms lay the whole secret of success. All sterilising or antiseptic agents must be strictly excluded; a condition of neutrality or slight alkalinity must be maintained; oxygen, anyhow in final stages, must be freely supplied; the temperature must be kept above the freezing-point of water, and the amount of food must be proportioned to the powers of the organisms. The results would be that, firstly, no previous chemical treatment was required; secondly, no sludge was produced; and, thirdly, the quality of the final effluent could be controlled, admitting as it did of being brought to any required degree of purity.

Dr. Sydney Barwise's paper on "The Purification of Sewage" dealt with the filtration process.

A paper on "Storm-water in Relation to Sewage Purification" was read by Mr. E. J. Silcock, F.G.S., borough engineer of King's Lynn. He said that one of the greatest difficulties in connection with the problem of sewage purification was that of dealing with the great fluctuation

n the flow of sewage to be dealt with owing to the admission of storm-waters into the sewers. His object was to endeavour to secure some sort of uniformity in the requirements of Rivers Boards, as to the amount of storm-water which must be dealt with at purification works, or, in other words, the degree of dilution of crude sewage beyond which it should be permissible to discharge through overflows into natural streams. It might be suggested that the solution of the problem was to be found in adopting a separate system of sewerage; but that system had never been carried out in its entirety in any town, and could not be adopted, even apart from the question of cost. In practically all towns of any size the pumping plant, the outfall sewers, and the main intercepting sewers were, to a certain extent, incapable of dealing with the whole of the rainfall, and had to be relieved by storm-water overflows.

Mr. W. Kaye Parry, M.A., of Dublin, presented a paper on "The True Principles of Sewage Purification." He contended that the question was settled by the researches of Mr. Walter E. Adeney since 1887. Mr. Parry summed up the system as follows. Mr. Adeney's method of sewage purification might be briefly summarised in the following terms: (1) Clarification under the best conditions by the use of a precipitant, at once the most effective and economical at present obtainable; (2) purification of the clarified liquid in the simplest possible way by supplying it with a sufficient quantity of oxygen through the agency of nitrate of soda; (3) the production of the minimum of sludge, inodorous and incapable of creating a nuisance.

Professor A. Bostock Hill, M.D., D.P.H., read a paper on "Filtration of Sewage through Coal." In the summer of last year, Mr. Garfield, the manager of the Wolverhampton sewage works, became possessed of the idea to see what effect would be produced by the filtration of sewage through a filter composed of fine coal. With Mr. E. W. T. Jones, public analyst for that town, he carried out experiments with filters constructed in which the media were coal of different degrees of fineness. The result there, and also at Lichfield, proved very satisfactory. In many cases where land of a suitable character could not be obtained, they had in coal a medium cheap and effective, which would produce an effluent as good as, or better than, that which could be obtained from land.

Mr. Donald Cameron, the city surveyor of Exeter, read a paper on "A Year's Experience of the Septic Tank System of Sewage Disposal at Exeter." Mr. Cameron concluded by saying that the Exeter installation, during its twelve months' work, had been subjected to the severest conditions that sewage works had to contend with, and had proved thoroughly reliable in all respects. The trial had been on a sufficiently large scale to give practical results, and was the outcome of experiment, step by step, leading from smaller to larger plants. It had been shown that sewage-disposal works could be designed so as practically to take care of themselves, requiring no more attention than a visit two or three days a week to change or alternate the filters, the work of a few minutes, and a day's work every month or six weeks in tidying the filters. Once a year it might be desirable to remove the deposit from the tank. By proper arrangements this could be done by the one man who acted as caretaker.

THE GROVE FEVER HOSPITAL, TOOTING.

ONE of three large fever hospitals erected by the Metropolitan Asylums Board is that now in course of construction at Tooting Graveney, from the plans and designs of Mr. A. Hessel Tiltman, F.R.I.B.A., selected in open competition. The architect has adopted the "échelon" principle in the disposition of the main pavilions, which are all arranged so that their axes are due north and south, thus obtaining the full benefit of the sun's rays. The general plan of the buildings, which will comprise no fewer than 36 blocks, we gave in the BUILDING NEWS on Aug. 27 last, when we also illustrated a general bird's-eye view of the buildings from the architect's design. To this plan and view we refer our readers for the general arrangement of the buildings, and we confine our present remarks to a few notes of the buildings in progress. The area of site occupies about 27 acres of land between Grove-road on the north

and Blackshaw-road on the south, and within a quarter-of-an-hour's walk from Tooting Junction Station of the B. and S.C.R. Eight large pavilions on the échelon system are ranged along the south side of the site, intended for scarlet-fever patients, which accommodate in all 352 beds, each pavilion containing 44 beds. Four smaller pavilions for diphtheria and enteric fever occupy the north side, and will contain in all 112 beds, or 28 beds in each block. These rows of pavilions are of two stories, and are planned parallel to each other. Between them, in the centre part of site, are six isolation blocks for 54 beds in all, for fever cases requiring separate treatment. The several pavilions are connected by open covered ways running along the inner ends of the main blocks, and along the centre of the six isolation blocks. These covered ways are now being constructed with a high subway below for all pipes, and the roof is carried on cast-iron columns at intervals.

Accommodation is provided for medical superintendent, who has a block outside the inclosing road on the north side, and for five assistant medical officers, a matron, and 200 nurses, whose separate blocks occupy the higher and eastern part of site, and contain bedroom, &c., for day and night nurses, with recreation grounds between them. The dormitory accommodation has been well arranged, and is shown on the plan. The laundry and boiler-house block is an important group of buildings, situated at the eastern side of the central isolation blocks, and connected by covered ways with the pavilions. The plan of this building is well considered, and from the laundry boilers proceed mains to all heating chambers, which are all worked from these boilers. The heating arrangements on the low-pressure system have been most skilfully devised by the architect.

We may now refer in more detail to the buildings we have been permitted by the architect to view. To take the large pavilions first. These are separated by airing-courts about 70ft. apart. Each ward is 120ft. long by 27ft. wide, and will contain 20 beds—10 on each side—with windows between. At the south end is the bath and lavatory at one angle, and at the other sink-room and closets, separated by ventilated lobby from ward, and between these two projecting corner buildings, which are carried up as low towers, is an iron escape stairs of two flights, and with ample space of landing. This is made a feature at the ends. At the other and north end are the usual ward offices, scullery, linen-room, and at the extreme end a two-bedded ward, also a nurses' sink, closet, and lavatory, larder, &c. A stone staircase and lift are also provided. Amongst the many details worth mention is an inspection window for the nurse, a portable bath with hot and cold water supply, and a bed-pan cupboard under the window of w.c., which can be pushed out of the lower part of window to await medical inspection. The smaller pavilions for diphtheria cases are similarly arranged, and provide for 12 beds on each floor. Each ward measures about 90ft. by 27ft. The six isolation blocks in the centre of site contain from eight to ten beds and vary in plan; each has its own airing-court and covered approach, the scullery, linen-room, reception-room, bath, and closet being placed between the wards. We notice that all the pavilions are well raised on an open basement about 5ft. above the ground, to secure dryness and ventilation. The walls are of malm facings, with red-brick arches, and in bands and dressings. The roofs are slated, and the ends half-hipped and ventilated. Interiorly we find the floors are on iron girders; the wooden joists are filled with concrete between, and will be boarded with teak-tongued flooring. The walls are plastered with Keen's cement, having all the corners rounded; and the dados are of Cliff's salt-glazed brown bricks, with moulded capping of same material. The lavatories have tiled floors. The windows have ordinary sliding sashes, with upper swing-lights to fall inwards, thus forming hoppers when open. The ventilating arrangements consist of square-shaped openings at intervals along the walls about 5ft. above floor of ward, with a hopper inside, which will direct the air-current upwards, and gratings on the outside of wall. The vitiated air will be drawn out of each ward by two large extracting shafts, which go from top to bottom of pavilion, and are lined inside with glazed bricks. These have openings or outlets below the ceilings of ward. The motive power creating draught will be furnished by heated pipes, &c., and the outlet is above roof-level. Two of Hayward's

glazed tile open ward stoves are placed in each ward, and there will be radiators round the walls with direct openings for fresh air, one to every other window. The administrative block, which stands at the eastern end of the diphtheria pavilions, next to the laundry, has a store court and covered court, and the kitchen arrangements and offices have been planned with considerable ingenuity. Many new features and points of detail, of great economic advantage in the working of so large an establishment, are shown in the planning of this part, but we have no space to mention these; suffice to say Mr. Tiltman has proved here again, as in other cases, a master of plan, and his design, now nearing completion, begins to assume organic unity. It has been satisfactorily carried out by Messrs. Kirk and Randall, of Woolwich, under Mr. Tiltman's personal supervision, Mr. Thomas Warburton acting as the chief clerk of works. The total cost will be about £223,000. The Architectural Association intend to visit the buildings to-morrow (Saturday) afternoon, and will meet on the site at 3.30 p.m.

HOUSE BUILDING BY RITUAL.

By COSMOS MINDELEFF.

THE man who builds a home, be he white or red, appears to be the special target of all kinds of trouble and annoyance; but in the latter case—that is, to the red man—there are certain requirements which make the task even more onerous, while on the other hand there are compensating advantages. The Pueblo tribes of Arizona and New Mexico, alone of all the Indians, build permanent stone houses, quite equal to those of white settlers in that country, and they have developed a peculiar system of building of their own which is of interest to every house-builder.

The Pueblo Indians now number about 10,000 souls, living in 30 villages, principally along the Rio Grande in New Mexico, and several distinct languages are found among them: but their house structures are essentially the same throughout. The largest of the villages, the pueblo of Zuni, which has a population of 1,600, has been often visited, and the seven villages of the Moki, in northern Arizona, are also becoming known through the periodical performance there of the celebrated snake-dance. Both of these groups have been studied for some years by the assistants of the Bureau of Ethnology, and the results of their work are now being published.

The houses of these people consist of groups of rectangular rooms, built of selected stone, or in recent years of adobe brick dried in the sun but not baked. The rooms are arranged in connected rows or clusters. Some of the latter are of huge size, resembling in appearance a gigantic hive and containing several hundred separate chambers. These were at first supposed to be communal structures, but it is now known that while each cluster is the home of a certain clan or combination of clans, the different families who compose it each have their own quarters in it.

The clustering of rooms into huge hive-like structures grows directly out of certain rules of house-building, which are the result of peculiar social conditions under which the people live. Among them descent is in the female line; the children of a marriage belong to the mother and are members of her clan and of her family. As a man is not allowed to marry within his own clan, he loses some of his rights when he takes to himself a helpmate, or, more correctly, when his helpmate takes him, for when he marries he goes to the home of his wife to live, and, to a certain degree, is adopted into her family.

From this it comes about that families in which there are many girls must necessarily increase and spread out over more area, while those in which the children are all boys become extinct in the second generation. But as the house cluster is the home of the clan, when it becomes necessary to erect additional rooms they are invariably added to and connected with those already occupied, and it is not unusual to see houses in course of construction at one end of a row while at the other end, or in an adjoining row, rooms are abandoned and going to decay. This odd condition misled the early explorers, who reported that the tribes were rapidly becoming extinct, whereas they are holding their own or increasing slightly in numbers.

The clans, which are great artificial families—all the members of which claim descent from some mythical common ancestor—are themselves

PUEBLO HOUSE BUILDING BY RITUAL.

subject to change from the same social conditions. Some grow and increase in size, while others wane and eventually become extinct. Thus in the Corn clan there are groups which claim to be of the stalk, leaves, grain, pollen, &c., and should the clan prosper, each of these subdivisions will develop into a full-fledged clan. It all depends on the number of girl children who are born into the clan.

In one of the Moki villages there is a little cluster of four or five rooms standing separate and apart from all other houses. It is the home of the remnant of the Butterfly people, now consisting only of an old woman and her young daughter, besides two sons. As the sons will eventually marry and go elsewhere to live, the future of the clan depends entirely on the young girl.

Should she live to marry and have many girl children, it is quite within the possibilities that the Butterfly clan may spread out and cover the whole village; but should she die unmarried, the clan will become extinct, the house will be abandoned, and in a few years its site will be marked only by a few heaps of stone, for it is the custom under such circumstances for the relatives of the family to tear down the house and re-employ the material.

The position of the women in the tribe is all that any of them could ask. They do no field labour, other than assisting in the harvest, and are free to devote their whole time and energy to their domestic duties and the care of their children. In the house their sway is absolute and undisputed. The crops in the field are considered the property of the man of the house, and he is required to work them; but when they are garnered and brought in they become the property of the woman, who is also the sole owner of the house in which they are stored. The status of the husband is merely that of an honoured guest, and should he misbehave in any way, he can be sent back to his family, or turned adrift to shift for himself. It is hardly necessary to add that the greatest affection prevails in the household, and

that such a thing as wife-beating or ill-treatment of women is unheard of in the tribe.

When a family finds it necessary to build additional rooms, notice is sent to the priestess of the clan, who makes the necessary arrangements. This priestess is the social head of the clan, and no business connected with the house can be conducted without her aid. She has also the final say in all proposed marriages, &c. The men of the family are required to bring in the necessary material; broken and dressed stone for the walls, beams for the roof, clay for mortar, &c. As the villages of the Moki are all situated on the tops of the mesas, 600ft. or more above the valley, this is no small task.

When everything is in readiness, announcement is made from the housetops by a crier, for the building of a house is a social function participated in by the friends and relatives of the woman who is to build. As the women own the houses and exercise absolute control over them, they are also the builders. There is always a man or two about, however, to do the heavy work. This duty is generally assigned to some of the male members of the family, and is not always willingly performed.

The chief of the village provides four eagle feathers, with a short cotton string tied to the stem of each. These are sprinkled with sacred meal, and prayers are breathed upon them for the welfare of the proposed house and its occupants, and that the walls may take a firm hold in the ground. The feathers are called nakwa-kwoshi, meaning a breathed prayer, and the prayers are addressed to Masauwu (the sun) and other deities concerned in house life.

The feathers are placed at the four corners of the house, and a large stone is placed over each one. The place where the door is to be is marked by bits of food placed on each side of it, with prayers that there may always be plenty of food within. The lines to be occupied by the walls are then marked by passing around the site from right to left, scattering on the ground particles of bread and other food mixed with native

tobacco. This ceremony is accompanied by a song to the sun couched in archaic terms, the meaning of which the people have now forgotten.

After this ceremony, the women proceed to lay up the stones in the walls, the heavier ones being lifted into place by the men, who are there for that purpose. Mud mortar, from a pile nearby previously prepared, is used sparingly, and the stones are laid in it in irregular courses. When the walls reach a height of 7ft. or 8ft., the top is brought to a fair level and the roof beams are put in place.

The roof beams are often brought from great distances, as suitable timber does not grow near the villages. In the Moki traditions it is stated that the beams for the mission buildings erected for the monks in the early part of the 17th century were brought on the backs of men from the San Francisco Mountains, a distance of more than 100 miles. Although the missions were destroyed in the insurrection of 1680, and never rebuilt, some of these old beams were used in other structures, and still can be seen there.

Above the main roof beams, which are about 2ft. apart, there is another series of lighter poles placed across them. Over these a layer of reeds or twigs is placed, and over this grass and brush. A layer of mud is then spread over all, and being covered with dry earth, is trodden down firmly. The women do all this work, and when it is finished, a floor is made inside with a thick coating of mud, trodden down in the same way; in fact, roofs and floors are much the same, and in the upper stories the floors of the rooms were once the roofs of those below. When the floors are done, the walls are plastered with mud, nicely smoothed with the hand. Sometimes they are finished with a wash of white clay, which gives them a very neat appearance. Formerly a custom prevailed of leaving a small space on the wall bare, a belief existing that one of the gods came and finished it; and although the space remained bare, it was supposed to be covered with an invisible plaster.

When the house is completed to this point,

four feathers are prepared, similar to those used under the four corners of the house. These are tied to a short willow stick which is inserted over one of the central roof beams. The feathers are renewed every year at the feast celebrated in December when the sun begins to return northward—that is, at the winter solstice.

The ceremony known as "feeding the house" is then performed. This is an offering to the sun, and consists of placing bits of food among the rafters, with prayers to the sun that he may smile upon the occupants of the house and not hasten the departure of any of them to the other world. After this, the women build a fireplace in one corner of the room under a hole left in the roof, and construct over it a chimney hood to confine the smoke to the proper exit. A binlike arrangement, or stone trough, is built in another corner, and three flat stones are mounted in it for grinding corn. The house is then ready for occupancy. The door is merely an opening, closed by hanging a blanket over it when necessary, and windows are merely holes left in the walls when they were constructed. In the cold winter weather these are closed by stone slabs, or built up solid with masonry, the filling being removed again in the spring.—*Scientific American*.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—III.

By AN ASSOC. INST. ELECT. ENGS.

ELECTRICAL ENERGY.—Attention has already been drawn to the fact that electricity in motion is produced by the conversion of one kind of energy into that of electrical, and the commercial applications of electricity consist in converting electrical energy into mechanical, thermal, or chemical energy. It is, therefore, of the utmost importance to be able to express in suitable units the work done electrically, and also to know the connection between these units and the corresponding ones used to denote mechanical energy.

Now, whenever a current of electricity flows through a circuit, resistance is overcome and work is done, and in all cases energy is given up. We have already pointed out that energy is the capability of doing work, and that energy is measured by the number of units of work done. In mechanics, work is said to be done by a force overcoming a resistance, and it is well known that work is made up of two components: force and distance. Thus to raise 100lb. of water vertically against the force of gravity work must be done, and it is evident that the work done is directly proportional to the force and also to the distance. Among engineers the unit of work is the foot-pound—that is, the work done by a force equivalent to the weight of 1lb. acting through a distance of 1ft. Work, then, is measured by the product of the force and the distance.

So far the time taken has not entered into the consideration of the work done. It is evident, however, that if it takes longer for one person to lift a certain weight through a certain distance than another person to do the same, then the power exerted in each case is not the same, although the amount of work done is the same. Work, then, is not the same as power. Power is the rate of working, being defined as the work done in unit time. The term "activity," suggested by Lord Kelvin, is now frequently used in the same sense, so that the activity in a circuit is the rate of doing work. The standard of power adopted by engineers is called the horse-power (H.P.), which is the name given to the rate of doing 33,000ft.lb. of work per minute. The horse-power, then, of a machine is the number of foot pounds of work done per minute divided by 33,000, indicating the rate at which an engine or machine can do work. The relationship between work and power may be stated algebraically as follows:—

work = power × time, and power = work ÷ time.

The principle of work is applicable to electrical energy, and to show the connection between the above unit or rate of working and the unit of electrical power, we shall refer to the dynamo as a means of converting mechanical energy into electrical energy. And from what has been said previously it is known that an electric current results whenever two points in a closed circuit are raised to a difference of potential, so that when a certain amount of mechanical energy is expended in driving a dynamo and a current traverses the external circuit, it is evident that

an electrical pressure has been set up, and, therefore, that current strength and electrical pressure (E.M.F.) are the components which make up the electrical energy given in exchange, as it were, by the dynamo for the mechanical energy supplied. At this point it may be mentioned in passing that a dynamo may be designed to give a small amperage at a high E.M.F., or a large amperage at a low E.M.F., and that the same mechanical power expended in driving a dynamo will produce 20 amperes at 50 volts, or 100 amperes at a pressure of 10 volts. And just as the product of the force and distance moved through per minute, or the number of foot pounds per minute, measures the mechanical power expended, so the product of the number of volts and the number of amperes, or the number of volt-amperes, measures the electrical power generated, developed, or absorbed in any part of a circuit. Instead of the name "volt-ampère," the term "watt" is now applied as the name of the unit of electrical power. That is—

$$E \text{ (volts)} \times C \text{ (amperes)} = W \text{ (watts)} \dots (10)$$

Again, the unit of electrical work is the joule; therefore, the watt may be defined as the joule per second. Now, the watt is one of the units most commonly met with in practice, and is usually defined as "the power developed in a circuit when one ampère flows through it under a pressure of one volt." And, although time is not mentioned in this definition, it is clear that this factor (time) is included, since an ampère is a definite quantity of electricity flowing per second. Therefore, to obtain the actual (electrical) work done in joules we have the relationship—

$$J \text{ (joules)} = E \text{ (volts)} \times C \text{ (amperes)} \times t \text{ (seconds)} \dots (11)$$

If a dynamo were driven by a 1H.P. engine, and no energy lost in heat, friction, leakage, &c., then we should receive back 1H.P. of electrical energy, which, determined by taking the product of the volts and amperes given out by the machine, would be found to be 746 watts. Therefore—

$$746 \text{ watts} = 1\text{H.P.} = 33,000\text{ft.lb. per minute.}$$

Worked Examples.—A few examples will now be considered to show the connection between the different units.

(1) A current of 15 amperes is sent through a circuit of 4 ohms resistance. What power in watts is absorbed?

$$\begin{aligned} \text{Now, by Ohm's law } E &= C \times R \\ \therefore \text{ power } W &= E \times C = (C \times R) \times C \\ &= C^2 R \\ &= (15^2) \times 4 = 900 \text{ watts.} \end{aligned}$$

(2) Find the H.P. required to feed five hundred 110-volt lamps, the resistance of each being 220 ohms.

$$\begin{aligned} \text{Power for each lamp} &= \frac{E \times C}{R} \\ \text{but } C &= \frac{E}{R} \text{ (by Ohm's laws)} \end{aligned}$$

$$\begin{aligned} \therefore \text{ watts per lamp} &= E \times \frac{E}{R} = \frac{E^2}{R} \\ &= \frac{(110)^2}{220} = 55 \text{ watts,} \end{aligned}$$

$$\begin{aligned} \text{and watts for 500 lamp} &= 500 \times 55 = 27,500, \\ \therefore \text{ H.P. required} &= \frac{27,500}{746} = 37 \text{ (nearly).} \end{aligned}$$

(3) If a 16c.p. lamp requires 0.7 ampère at a pressure of 110 volts, how many watts does each candle-power require?

$$\begin{aligned} \text{Watts for each 16c.p. lamp} &= E \times C \\ &= 110 \times 0.7 = 77 \text{ watts} \\ \therefore \text{ watts per candle power} &= \frac{77}{16} = 4.8125 \text{ watts.} \end{aligned}$$

(4) How many 16c.p. lamps, taking 4 watts per candle, can be run off a dynamo giving 7 electric horse-power?

$$\begin{aligned} \text{Since } 1\text{H.P.} &= 746 \text{ watts} \\ \therefore 7\text{H.P.} &= 7 \times 746 = 5,222 \text{ watts.} \end{aligned}$$

And since 1c.p. requires 4 watts—

$$\therefore \text{ each lamp of 16c.p. requires 64 watts.}$$

$$\therefore \text{ No. of 16c.p. lamps} = \frac{5,222}{64} = 81 \text{ lamps.}$$

(5) A dynamo is 100 yards from a house, the conductor has a resistance of 0.002 ohm per yard, and there are 150 30-watt 100-volt lamps to be fed. What E.M.F. must the dynamo give?

$$\begin{aligned} \text{E.M.F. required} &= 100 \text{ volts for lamps} + \text{drop in} \\ &\quad \text{volts along the mains.} \end{aligned}$$

$$\begin{aligned} \text{Now resistance of mains} &= 0.002 \times 200 \text{ (lead \& return)} \\ &= 0.4 \text{ ohm.} \end{aligned}$$

Note.—The conductor has to go to and from the house, and current required for each lamp—

$$= \frac{W \text{ (watts)}}{E \text{ (volts)}}$$

$$= \frac{30}{100} = 0.3 \text{ ampère.}$$

$\therefore$ current required for 150 lamps—

$$= 0.3 \times 150 = 45 \text{ ampères.}$$

And since the drop in volts along a conductor = $C \times R$,

$$\therefore \text{ the drop in volts through } 0.4\omega = 45 \times 0.4 = 18\text{v.}$$

$$\therefore \text{ E.M.F. required} = 100 + 18 = 118 \text{ volts.}$$

The Kilowatt.—Another unit of power, adopted as a commercial unit, is the kilowatt, which is a secondary unit 1,000 times the size of the watt, i.e.—

$$1 \text{ kilowatt} = 1,000 \text{ watts.}$$

And since the watt is $\frac{1}{746}$ of 1H.P., it will be

obvious that the value of the watt is extremely small, and, consequently, that large and somewhat inconvenient numbers have to be used to denote the power and size of large dynamos when given in watts. For instance, a dynamo supplying 500 amperes at a pressure of 120 volts gives out energy at the rate of (500×120) 60,000 watts. Expressed in horse-power, this would be $\frac{60,000}{746}$, or 80.4H.P. And it is certainly more

convenient to denote its power as 60 kilowatts, or its size as a 60-unit machine. A little consideration will show how the number of kilowatts can be easily turned into its equivalent number of horsepower. 1,000 is slightly more than $1\frac{1}{2}$ times 746, therefore 1 kilowatt corresponds approximately to $1\frac{1}{2}$ H.P., from which we get the following rule:—

"The horse-power required for a dynamo is obtained by adding one-third of the number of kilowatts to the number of kilowatts."

Thus, in the above case, the horse-power of the 60-unit machine

$$= 60 + \frac{1}{3} \text{ of } 60 = 60 + 20 = 80\text{H.P.}$$

The Connection between Electricity, Heat, and Light.—Now that we are able to express in proper units the electrical energy equivalent to a certain amount of mechanical energy, we are in a position to consider the problem of converting electrical energy into heat and light. In a glow lamp, for instance, a certain voltage and amperage are required to produce a certain amount of light—in other words, to keep a glow lamp burning brightly, a certain number of watts of energy are consumed, and work is done at a definite rate. Now, the electrical power absorbed when electricity passes along a conductor is $C \times E$ watts, and if this energy is not transformed into mechanical or chemical energy, it is converted into thermal energy, either usefully for producing light, &c., or wastefully by being frittered away as heat. In either case, the heat produced is equivalent to CE watts; but $E = C \times R$ by Ohm's law, therefore the equivalent thermal energy of the electrical energy is $(C \times R) \times C$, or $C^2 R$ watts. So that power may generally be defined as the rate of transformation of one form of energy into another, and in an electrical circuit the heat produced per second is proportional to the number of watts consumed. And as a body becomes luminous and emits light when its temperature is very high, it follows that the light produced is proportional to the energy absorbed, so that glow-lamps giving the same light approximately absorb the same power. As is probably well known, the practical unit of light is the candle-power (c.p.), which is the amount of light produced by a standard candle weighing six to the pound, and burning 120 grains of spermaceti wax per hour.

Now, a well-constructed incandescent lamp absorbs from 3.5 to 4 watts per candle-power, from which it is evident that an ordinary 16c.p. lamp of first-class make requires from 56 to 64 watts. It may be mentioned here, although we shall have to consider many interesting points respecting details of lamps at the proper time, that it is usual and convenient to mark on the lamp the voltage required to send the necessary current through a lamp to make it burn brightly, and to designate the lamps 60, 100, 110, 200, or 220-volt lamps as the case may be. If we know the voltage and amperage required by a certain lamp, the necessary horse-power to light a given number of lamps is found by dividing the product

of the number of lamps, voltage, and amperage by 746, that is—

horse power =

$$N \text{ (No. of lamps)} \times E \text{ (volts)} \times C \text{ (ampères)} \dots (12)$$

746

Board of Trade Unit.—Another unit—the legal quantity fixed by the Board of Trade for the purpose of public supply—or the Board of Trade Unit, may now be considered. Technically it is called the *kilowatt-hour*, and as this name implies, it is the product of a rate of doing work into a period of time, and is the measure of an action lasting a certain time. Thus a consumer has received one B.O.T. unit, or one B.T.U., when the product of the electrical rate of working in watts and the number of hours during which the supply lasts equals 1,000, and the number of B.T.U.'s is found by dividing the product of the volts, ampères, and hours by 1,000. Thus ten 100-volt lamps taking one ampère each require a supply one B.T.U. if placed in a circuit supplying energy at this rate for one hour. The following equivalents of the Board of Trade are useful, and the student is advised to verify the same.

$$\begin{aligned} 1 \text{ B.T.U.} &= 1,000 \text{ volt-ampère hours.} \\ &= 3,600,000 \text{ joules.} \\ &= 3,600,000 \text{ coulomb-volts.} \\ &= 1\text{·}34 \text{ H.P. working for one hour.} \end{aligned}$$

The average charge by electrical companies for electrical energy is 6d. per unit for lighting purposes, so that it is evident 50 glow lamps taking 60 watts each would cost 1s. 6d. per hour; whilst if 4d. per hour be the charge for motive power, then the cost of an electrical horse-power for one hour is 3d.

Worked Examples.—(1) What would it cost to light 250 220-volt 16c.p. lamps for 100 hours, if the lamps take 60 watts each and the charge be 6d. per Board of Trade unit?

$$\text{Each lamp takes} = \frac{60 \text{ (watts)}}{220 \text{ (volts)}} = \frac{3}{11} \text{ ampères.}$$

And number of B.T.U.'s

$$\begin{aligned} &= \frac{N \text{ (No. of lamps)} \times E \text{ (volts)} \times C \text{ (amps.)} \times T \text{ (hrs.)}}{1,000} \\ &= \frac{250 \times 220 \times \frac{3}{11} \times 100}{1,000} = 1,500. \end{aligned}$$

$$\therefore \text{cost at 6d. per unit} = 1,500 \times 6d. = \text{£}37 \text{ 10s.}$$

(2) A dynamo gives 40 ampères at 2,000 volts. How long will it take to deliver one B.T.U.? What will be the income per hour if charge be 6d. per unit?

$$\begin{aligned} \text{The output of the machine} &= \frac{40 \times 2,000}{1,000} \\ &= 80 \text{ kilowatts} = 107\text{·}2 \text{ H.P.} \end{aligned}$$

and since there are 3,600 seconds in 1 hour, the No. of B.T.U.'s delivered per second—

$$= \frac{80}{3,600} = \frac{1}{45} \text{ B.T.U.}$$

$$\therefore 1 \text{ B.T.U. would be delivered in 45 seconds.}$$

And since the output is 80 kilowatts—

$$\begin{aligned} \therefore \text{in 1 hour 80 B.T.U.'s would be delivered,} \\ \text{and income per hour} &= 80 \times 6d. = \text{£}2. \end{aligned}$$

That is, 107·2 H.P. would be supplied for 1 hour for £2—that is at the rate 4½d. per H.P. per hour.

(3) Determine whether it is more economical to use (a) 16-candle-power lamps taking 3 watts per candle and having a life of 600 hours, or (b) 16-candle-power lamps taking 3·5 watts per candle and having a life of 1,000 hours. Given cost of electrical energy as 6d. per B.T.U., and cost of renewals as 1s. 3d. in each case.

The comparison may be made by assuming that the two kinds of lamps are used for 3,000 hours and the total cost of energy used and cost of renewals determined for each kind; but a better way is to determine the total cost per candle-hour for each lamp, as follows:—

(a) Total cost per candle-hour of lamps using three watts per candle.

$$\begin{aligned} \text{Quantity of energy in B.T.U.'s per candle for one} \\ \text{hour} &= \frac{3}{1000} = 0\text{·}003. \end{aligned}$$

$$\begin{aligned} \text{Cost of energy per candle-hour} &= 0\text{·}003 \times 6 = 0\text{·}018 \text{ penny.} \end{aligned}$$

$$\begin{aligned} \text{Cost for lamp renewals per candle-hour} &= \frac{15}{16 \times 600} \text{ penny} = 0\text{·}00156 \text{ penny.} \end{aligned}$$

$$\therefore \text{Total cost per candle-hour} = 0\text{·}018 + 0\text{·}00156 = 0\text{·}01956 \text{ penny.}$$

(b) Total cost per candle-hour of lamps using 3·5 watts per candle.

$$\begin{aligned} \text{Quantity of energy in B.T.U.'s per candle for one} \\ \text{hour} &= \frac{3\text{·}5}{1000} = 0\text{·}0035. \end{aligned}$$

$$\begin{aligned} \text{Cost of energy per candle-hour} &= 0\text{·}0035 \times 6 = 0\text{·}021 \text{ penny.} \end{aligned}$$

$$\begin{aligned} \text{Cost for lamp renewals per candle-hour} &= \frac{15}{16 \times 1000} \text{ penny} = 0\text{·}0009375 \text{ penny.} \end{aligned}$$

$$\therefore \text{Total cost per candle-hour} = 0\text{·}021 + 0\text{·}0009375 = 0\text{·}0219375 \text{ penny.}$$

Therefore the lamp (a) is the more economical.

(To be continued.)

AN ADJUSTABLE SET-SQUARE AND PROTRACTOR.

MR. WILLIAM V. COOK, of 12, St. Margaret's Plain, Ipswich, has invented and is making a handy adjustable set-square and

protractor for use with the T-square in the same way as the ordinary set-square.

It is more especially suitable for purposes in connection with which lines are required inclined at angles other than those given by ordinary set-squares. For setting out roofs, staircases, batters, &c., it will be found especially useful. It can be adjusted to any angle and firmly fixed by means of the clamping-screw A. Lines can then be drawn at this angle inclined both to left and right upon the paper, and also perpendiculars to them, without resetting.

No other set-square is needed if this is used, and as a protractor it will be found quick and convenient. Once set to the angle wanted, lines can be drawn anywhere on the paper without further trouble. It is made in polished mahogany with ebony edge and electrum mounts for 7s. 6d., or post free 7s. 7½d.

CAIRNBURG CASTLE.

THE ancient Castle of Cairnburg, near Fraserburgh, on the north-east coast of Aberdeenshire, has just been restored, enlarged, and rendered habitable from plans by Messrs. Marr and Jenkins, of Aberdeen. The castle was and is purely Baronial in style. The north portion is in the form of a square tower, while the south is flanked by a low circular tower. These two prominent landmarks were the almost only remaining portions of the building, the intervening space, which had formed a square block in keeping with the general style of the building, having been for a century in ruins. The castle was built on a knoll 20ft. in height, immediately to the south of the Water of Philorth. The basement of the square north tower, which was in modern days known as the dungeon, is now to be used as a cellar. The next flat, the great dining-hall of the old lairds, will probably at some future time be converted into a billiard or dining room. A new wooden spiral staircase of 96 steps leads from the first floor to the summit. The two flats above the great hall will be occupied as bedrooms. At the top of the tower the parapet has been finished with embattlements, and a promenade has been made, from which an uninterrupted view can be had from all points of the compass of the surrounding land and sea. A flagstaff is erected on the highest point of the structure. The basement of the round tower at the south end of the castle is fitted up as a cloakroom, above which is an octagonal business-room. The business-room is floored with pitch-pine and polished. In the fireplace a dog-grate has been inserted, with tile

linings at the backs and sides, built in the shape of bricks. Cut above the fireplace and on the chimney panel is the inscription, "Remove not the ancient landmark." The ceiling has the beams displayed below, the interstices being filled with plaster work. The ornamentation of the ceiling has been carried out in black and gold, bestudded with stars. The woodwork is stained and polished dark oak. There are several arched recesses for bookcases and the like, and the windows are also all circular-headed. Above the business-room there is an octagonal bedroom, while above that is the library, comprising two flats in the old tower, and having a total height of 17ft. The beams are shown in the ceiling the same as in the business-room. The conversion of the two flats into one has been accomplished by cutting into the floor of the upper flat, so as to form an octagonal opening to the room below, leaving a platform or balcony 3ft. wide all round the upper portion. The ceiling of the balcony is formed with moulded linings of cypress wood. Both divisions are shelved for the reception of books, and the balcony is connected with the floor by means of a stair; this stair, as also the balcony, has an oak rail with turned balusters. From the library a stair ascends to the flat roof of the round tower.

The more modern part of the building is that which has been entirely rebuilt—the space intervening between the two towers. It has a frontage of 66ft., and contains the principal rooms of the castle. The ground floor is occupied by the kitchen, scullery, servants' hall, and bedrooms, larder, pantries, store-rooms, &c. At the back of the northern part of the building is the kitchen court, and extending in the same direction is the old keep. On the first floor are the dining-room and drawing-room, each 23ft. by 18ft., both entering from the corridor on the east side. The dining-room floor is of polished pitch-pine wood, with a border round the whole, laid separately. The ceilings are panelled in plaster, the woodwork is dark oak, and the chimney-piece of a Doric type. The drawing-room is practically the same as the dining-room, with the exception that the woodwork is enamelled white and the chimney-piece ornamented with designs of flowers. In these rooms, as well as the hall and corridor, the lower sashes of the windows are of plate-glass, the upper being leaded lights in small squares. Most of the windows have panes of the old-fashioned type, in which "knots" are the predominant feature. On a number of the panes of glass in the windows of the dining and drawing rooms are designs of all classes of sea-going vessels, from the oldest periods to the present day. There is also inscribed on one part of a window the names of the successive proprietors of Cairnburg estate and Castle.

There are two entrances to the castle—one of secondary importance, near the back of the square tower, and the other at the south-east side of the main building. The latter is the principal entrance. There does not appear to have been any regular drive to the castle in the olden times, but it must have been approached from about the same point as the new avenue is formed—namely from the south side of the Bridge of Philorth, on the Cairnburg-road. At the entrance to the avenue a lodge will be erected, and the drive will be continued in a curving sweep to the castle, the ground within the curve being planted with a variety of trees which will withstand the sea winds. The entrance will be from a circular gravelled space at the south side. Leading to the outer door there is a flight of steps, seven in number, giving a staircase of about 7½ft. wide; and inside is a hall, divided from the corridor by another flight of steps and a glass door. Passing along the corridor, the entrances to the dining and drawing rooms are found in juxtaposition, while from the hall stairs lead to the business-room and the garden. One flight of steps outside are of Corrennie granite, with handrails on each side of the same colour of stone. The outer door is of teakwood, studded with inch-headed nails. In front of the business-room door there is a platform which can be used as a rostrum from which to address an audience underneath in the hall. The ceiling of the hall is 17ft. high, and the walls are panelled with cypress wood to the height of 8ft. all round. The main stair which leads to the upper story is skirted with a massive handrail of oak, moulded, with carved and moulded posts, also of oak, and heavy turned balustrades. This flat is occupied by a suite of bedrooms, six in number, bathroom, &c., the floors of which are all stained and polished. To

FREESTONE CHIMNEYPIECE (A.D. 1601), LOWER COURT FARM, UPPER LANGFORD, SOMERSET.

the bathroom hot water is circulated through copper pipes from a cylinder in the scullery. A drying-loft occupies the upper flat, and a lift is constructed from the scullery to the dining-room pantry. A speaking-tube connects the nursery with the kitchen.

Following closely the style of the old building, every gunport and loophole has been reproduced, and the ancient square turret has been renewed on the north side. The bell-pull at the entrance door has a crank about 8ft. from the entrance platform, and suspended from it is a square rod with a massive oval bronze handle or pull attached to the end of the rod by a piece of chain, the pull being about 4ft. long. The building is fitted with electric bells throughout. Outside the castle the grounds will be decorated, so far as the surroundings will lend themselves to richness. The slope on the east side will be terraced, and the whole space inclosed and planted with trees and shrubbery. The garden, which has been well known in the district for many years back, has been inclosed with new walls, in keeping in every way with the style of the castle. The remains of the old moat are to be formed into an ornamental lake. A noteworthy fact lies in the discovery having been made, while the reconstruction was going on, that the courtyard was paved with stones taken from the beach.

Internally the house will be lighted by electricity—a mode of lighting hitherto unknown in the locality. The dynamo will be revolved by an oil-engine, and all the fittings have already been laid. Provision is also made for having the castle lighted by gas. The cost of restoration has been over £5,000, and the beautifying of the surroundings will run into another four figures. A fresh supply of water has been introduced from a spring, locally known as the Camp Well, situated upon the lands of Cairnbulg, and which is to be pumped up by means of a windmill. The principal contractors were Messrs. Brebner and Jenkins, builders, Fraserburgh.

FREESTONE CHIMNEYPIECE, LOWER COURT FARM, UPPER LANGFORD, SOMERSET.

THIS elaborately-carved chimneypiece is in a wainscoted bedroom on the first floor of the house, which belongs to General Sir Lintorn Simmons, G.C.B. The chimneypiece bears the date 1601 on a small shield in the right-hand spandrel, and the initials R. I. K. on a shield in the left-hand spandrel. The male and female figures on either hand are supposed to represent Adam and

Eve, bearing on their heads baskets of pomegranates. It will be noticed that the figures are not placed symmetrically under the uprights they support. A shield in the centre of the frieze, supported by crocodiles, bears a coat-of-arms, whose charges appear to be dominoes and martinetts. The bed-mould of the cornice has a curious variety of egg-and-tongue enrichment, turned upside down, and very deeply undercut.

T. BRADFORD BALL.

THE CONDITION OF THE PARTHENON.

IN a letter on the Parthenon which appeared in yesterday's *Times*, Dr. Wilhelm Dörpfeld states that the temple is by no means yet "doomed," as was asserted by another correspondent some six weeks since. The condition of the structure is, he adds, "certainly not satisfactory. Earthquakes and fire, rain and sun, frost and heat, several bombardments, and more especially the unfortunate explosion of the Turkish powder magazine by the Venetians under Morosini in 1687, have all contributed to annihilate entirely large portions of the temple and severely to injure those still preserved, and even to destroy in many places the beautiful white marble. One has only to read the reports of the three distinguished European architects—the Englishman, F. C. Penrose, the German, T. Dorn, and the Frenchman, T. Magné—on the state of the temple in order to satisfy himself that the structure has indeed suffered severely and that the condition of certain portions is even dangerous. But, according to the undeniably authoritative opinion of those architects, the damage is not so serious as has been described, and, on the contrary, the preservation of the existing structure for hundreds, and perhaps thousands, of years is still possible. One thing only is necessary—viz., that the proposed repairs shall be carefully and expeditiously carried out. The same conclusion has been arrived at by the committee of Greek and foreign architects and archaeologists to whom the Greek Government has intrusted the task of superintending them. As the opinion of all these experts with regard to the mode of restoration shows few divergences, the work might be taken in hand at once, those repairs being undertaken first upon which all the experts are agreed. Last winter a solid scaffolding was erected along the western portion of the temple in order first of all to replace the specially-damaged epistylion beams of the opisthodomus by new ones. The

stones required for this purpose had in part been already brought from Pentelicon to the Acropolis and the machinery obtained for raising these huge blocks, and work was about to begin when war unhappily broke out and arrested the progress of operations. The funds for the work of restoration were granted by the Greek Archaeological Society, which derives its revenues from a lottery sanctioned by the State. This year, unhappily, owing to the disastrous war, the lottery has hardly produced anything, and the society has consequently no funds at its disposal to prosecute the works. The repairs have, therefore, been temporarily interrupted, and who knows when they may be resumed?" Professor Dörpfeld urges that it would be advisable to place the remaining portions of the frieze in a museum, and to replace it on the temple by a copy. In conclusion, the Professor refers in terms of high approval to the care now bestowed upon the antiquities of the country. This, he says, is due in part to the Greek Archaeological Society, but chiefly and in the first place to Mr. P. Kavvadias, the Director-General of Antiquities, especially since he has combined the secretaryship of the Archaeological Society with the direction of the Antiquities Department of the Ministry.

THE CAUSE OF ARSENICAL POISONING BY WALL-PAPERS.

IT has long been recognised, says Mr. Thomas Bolas, F.C.S., writing in the *Society of Arts Journal*, that arsenical wall-papers do serious mischief; but the work of Gosio and of Emmerling seems to have cleared up that mystery which has surrounded the matter. Certain moulds, including the very common *mucoi mucedo*, have a remarkable property of decomposing arsenical compounds with the evolution of volatile products containing arsenic, and the highly poisonous character of volatile arsenical compounds, coming into the system by way of the respiratory organs, is well known. Arsenious acid is, even in small quantities, a highly antiseptic substance, and poisonous to moulds, so the throwing off of the arsenic in a volatile form may be an effort of nature to cast out the poison. The arsenical copper greens, and other colouring matters containing arsenic, are still used, and, paradoxical as it may appear, it is by no means improbable that the most dangerous wall-papers are those containing a mere trace of arsenic, as when the quantity is large the moulds cannot exist. Traces of arsenic may come into wall-papers from the imperfect

washing of vessels used to contain the more highly arsenical colours. Now that boric acid is very cheap, the old, and perhaps forgotten, suggestion of Bolley to use a precipitated borate of copper as a green pigment in place of the arsenical green deserves attention. Bolley's green is prepared by taking two parts of blue vitriol (crystallised cupric sulphate) and three parts of borax in separate quantities of cold water and mixing, after which the precipitate is washed and dried. Dyed and printed fabrics now very frequently contain traces of arsenic.

CHIPS.

A movement is on foot at Burton-on-Trent to place a memorial in St. Paul's Church to the founder, the late Mr. M. T. Bass, and his wife. It is proposed that the memorial should take the form of a lectern.

It was resolved at the monthly meeting of the Halifax School Board, on Monday, that plans be invited from Halifax architects for the proposed new school at Sunnyside, to show accommodation for 300 mixed and 200 infants, to be built first, and other 500 places when required.

After many unsuccessful efforts, the Greek Archaeological Society has obtained possession of the thickly-inhabited quarter of Athens known as Anaphiotika, lying immediately under the Acropolis. The inhabitants, who will receive compensation, will be deported to the suburbs, and excavations which promise a rich yield of interesting discoveries will shortly begin.

The extension of the Victoria Station of the Great Central Railway in Sheffield, to provide for the increased traffic which will result from the opening of the through line to London about twelve months hence, is making good progress. The station is situated at a considerable level above the street, and the first work has been to erect piers to carry the railway along the whole length of the extension. The River Don will be spanned by huge girders nearly 100ft. in length. Girders will also be used to bridge over the canal. The other piers, which number some 15, are nearly completed.

The French engineers have just completed the construction of a military tunnel on the Alpine frontier. This is through the peak of Parpaillon, at a height of over 9,000ft., and will establish communications between Port Tournous and the position of Embrun. The length of the tunnel is about five hundred yards, and five years have been occupied in its construction; but this protracted period is explained by the fact that work could only be carried on in that elevated region during four months of the year.

A stained-glass window has just been erected in the parish church of Lundie, N.B. The window was designed by Sir Edward Burne-Jones, and supplied by Messrs. Morris and Co., Merton Abbey, Surrey. It measures 11ft. by 3ft., and bears the figures of the Evangelist John in the attitude of enforcing the doctrine of the opening words of his Gospel, which are written on a roll held up by his right hand:—"In principio erat Verbum, et Verbum erat apud Deum, et Deus erat Verbum." The figure is surmounted by an eagle, below the figure is the name "S. Johannes," and at the base is the inscription.

On Tuesday in last week, the chapel in her Majesty's prison, Northallerton, was reopened and rededicated, after internal reconstruction. A portion of the right side has been partitioned off for the accommodation of 20 female prisoners, while the remainder has seating for 90 males. Church furnishings of a suitable kind have been provided.

At a meeting of Peterhead Harbour Trustees held on Monday, it was resolved to send Mr. Barron, their engineer, to negotiate an additional loan of £21,000, being £15,000 to complete the North Harbour Improvement Scheme, and £6,000 for the reclaimed ground on the South Bay.

The house named Sandycroft Lodge, at St. Margaret's, Twickenham, in which J. M. W. Turner, R.A., resided for many years, was sold on Tuesday by Messrs. Chancellor and Sons at the Mart, Tokenhouse-yard. This house, which for a time was called Solus Lodge, is believed to have been built from the designs of Turner himself, and, according to Mr. Ruskin, he occupied it from 1808 till 1827, although other writers give the time as from 1814 to 1826. At that period the house faced the river, but now several modern villas have been erected opposite. The house contains four bedrooms, dining and drawing rooms, library, and the usual offices, nothing having been altered, except by the addition of a bath-room, since Turner left it. A garden surrounds the residence. Bidding began at £1,000, and proceeded slowly until £1,200 was reached, at which the property was sold, the rental being £65 per annum.

OBITUARY.

THE death of Mr. THOMAS GOUGH, surveyor and architect, of Knighton, took place last week, in the 59th year of his age. He had held the appointment of surveyor to the Knighton Highway Board, and subsequently to the Rural District Council, for 25 years. He also carried on an extensive practice as an architect in the town and neighbourhood, and was highly respected throughout a wide district. He was a Wesleyan, and for many years was an appointed local preacher. He had also acted as political agent to the Conservative party.

Mr. W. CLAPHAM, the well-known Lancashire landscape gardener, of Bramhall Park, Stockport, died on Friday, after a very short illness, at New Brighton, aged 65 years. He was connected with the Tower Grounds at that resort from their commencement, and to him is due the credit for the formation of the central lake and the utilisation and improvement of the natural beauties of the property. His *tour de force* was the construction of the cycle and running tracks and football ground (said to be the best in England) in less than two months, employing about 1,000 men in the task, and superintending them night and day with unflagging energy. He did much for the Tower at Blackpool and also the Winter Gardens there, and his work is well known in many of the ancestral seats of Yorkshire, Lancashire, and Derbyshire.

Mr. ARTHUR P. COTTERILL, builder and contractor, of Crewe, and alderman of that borough, died on Thursday in last week at his residence in Nantwich-road, Crewe. Mr. Cotterill had built up a most successful business. He constructed the Crewe Cattle Market, he built the Royal Hotel and the Hotel Extension, St. John's Church in Stalbridge-road, and many other public edifices. He was a man held in the highest esteem for his business probity and his high character. He was a Liberal in politics. He took a great interest in the town's affairs back in the old local board days, and when the charter of corporation was obtained he was one of the first elected councillor. Many years ago he was elected an alderman. As a builder his services were peculiarly valuable to the council, more especially years ago, when new streets were being laid out and new works undertaken. He has not been able to attend the meetings of the council for some time. About five years ago his eyesight was affected, and for the past two years he had been quite blind.

THE death of Mr. ALFRED W. AYERS, J.P., occurred at his residence, 13, Priory Hill, Dover, on Tuesday in last week after sixteen days' illness. Since recovering from a long illness, Mr. Ayers had devoted himself with his usual zeal to his public duties as town councillor, magistrate, and guardian of the poor, although not without some premonitions of serious weakness. The announcement of the death was made in the Town Council on the day of his death, and as a mark of respect for the deceased the meeting immediately adjourned without transacting any business. Mr. Ayers was born in Dover 61 years ago, and had been engaged in that town with his late father in conducting important works connected with the barracks and fortifications of the Western Heights. For eighteen successive years they had building contracts there, and amongst the works which they carried out was the building of the South Front Barracks. Mr. Ayers commenced public life in November, 1873, entering the Town Council as a representative of the Town Ward; but at the end of his term of three years he was not re-elected. After that the Town Council saw him no more for sixteen years, and during that interval he penetrated to the interior of Australia. Returning to Dover he again engaged in the building business, and in 1883 was elected a member of the Dover Board of Guardians in succession to his father, who had for many years filled the same office. Mr. Alfred Ayers continued to hold the same seat up to the time of his death. Mr. Ayers entered the Town Council for the second time in May, 1892, and continued a member till his death. By his death Dover loses an impressive and an aggressive individuality.

After much controversy as to the merit of various sites suggested for the central post office for Aberdeen, the Postmaster-General has given his decision in favour of the one in Crown-street.

Building Intelligence.

GLASGOW.—Cambridge Buildings, a new block of business premises now in course of erection in Sauchiehall-street (and which when extended as contemplated will complete the corner with Cambridge-street), will have a frontage to Sauchiehall-street of 94ft. 6in., and a depth of nearly the same. The buildings are five stories in height, with a basement floor, and the Italian style has been adopted, the stone used being Locharrbriggs red freestone, enriched in parts with Peterhead granite. The entire buildings will be occupied by Messrs. Thomas Muirhead and Co., warehousemen. The street and first floors will be used as a retail drapery and silk warehouse, while the upper floors will consist of show-rooms, work-rooms, &c. There will be a passenger lift, and the whole premises will be lighted by electricity. The work is being carried on from the designs of Mr. James Thompson, architect, F.R.I.B.A., 83, Bath-street, Glasgow, who is also the proprietor.

NEWCASTLE-UNDER-LYME.—A contract for the pewing of St. Giles's Church has been made with Messrs. Jones and Willis, of Birmingham, and for the present seating accommodation of chairs, which have served that purpose since the opening of the church in 1875, there will be substituted a permanent seating of open benches in oak, the design being in harmony with that of the fine church, which is one of the last examples of the late Sir Gilbert Scott's work. The present contract includes the pewing of the nave, three stalls of special design being provided on the south side for the use of the corporation during their visits to the church. The seat for the Mayor is appropriately distinguished among these. The work is being carried out from the design of Mr. J. Lewis, architect, of Newcastle. The side chapel will also be re-seated in oak.

PRESTON.—The new Technical School in Corporation-street, which has been built out of funds provided by the trustees of the late Mr. E. R. Harris, on a site given by the corporation, was opened by the Countess of Derby on Friday. It has been built from the designs of Messrs. Cheers, Aspinwall, and Smith, and has cost, exclusive of furnishing, about £15,000. It comprises a weaving shed—one of the largest in the country—a large spinning shed, a textile museum, a lecture hall, classrooms, and every provision for teaching the staple trades of the district. Special rooms are set apart for classes in mechanics and engineering, machine and building construction, carpentry and joinery, plumbing, &c. Active steps are at present being taken to equip the building with machinery and all the most modern appliances for teaching the various industrial processes.

ST. JOHN'S WOOD, N.W.—Considerable alterations have been carried out at the east end of the chapel of ease at St. John's Wood, in order to afford more accommodation to the choir, and to widen the approach to the sacristy; for which purpose the high pulpit has been moved more forward, towards the west, involving the removal of some of the seats. The smaller pulpit has been cleared away, and part of it utilised as a reading-desk and a credence table. Formerly the choir seats were on a level with the floor of the church, but to give greater prominence to the musical part of the service they are now raised upon platforms. The organ, which was formerly in the west gallery, has been remodelled and brought down to the rear of the choir, under the north gallery. These alterations have been carried out by Mr. Forsyth, of Finchley-road, from plans prepared by Messrs. Forsyth and Maule, architects, of 16, Great Marlborough-street, W.

At Wye, South-East Kent, on Wednesday week, the foundation-stone was laid of master's residence that is being added to Thornhill Charity Schools by private donors. Mr. Henry J. Jeffery, of Ashford, is the architect, and Mr. G. F. Davis, of the same town, the builder.

At King's Heath, Birmingham, the foundation-stones of a new Baptist chapel were laid on Friday. The building will be faced with Leicestershire bricks, with Hollington stone dressings, will measure 72ft. by 43ft., and will seat 450 persons. At the rear will be vestries, ladies' room, and school-room or lecture-hall, seated for 450. Mr. Arthur Harrison is the architect, and Messrs. J. Moffat and Sons are the contractors; the outlay will be about £7,000.

Engineering Notes.

CENTRAL LONDON RAILWAY.—The first junction of the tunnels between Holland Park and Notting Hill-gate Stations was successfully made on Saturday night. The following junctions will be made before the end of the current year—viz.: Shepherd's Bush Station and Woodhouse Park (the generating station), Shepherd's Bush and Holland Park Stations, and Queen's-road and Westbourne Stations, and in February, 1898, the last junction of 1, 2, and 3 contracts will be made between Notting Hill-gate and Queen's-road Stations.

LYNTON AND BARNSTAPLE RAILWAY.—This line, which was commenced two years ago, will be opened for traffic next Easter. It is about 19 miles in length, starting from a joint station with the London and South-Western Railway within the town of Barnstaple and terminating on the hill about three-quarters of a mile from Lynton. Five intervening stations are provided, at Chelfham Mills (for Goodleigh, Stoke Rivers, and Loxhore), Bratton, Fleming (for Challacombe), Blackmore Gate (for Ilfracombe, Comb Martin, and Kentisbury), Parracombe, and Martinhoe Cross for Wooda Bay, Martinhoe, and Trentishoe. The 2ft. gauge is adopted. The road has now been cut throughout, and the greater part of the permanent way has been laid, while most of the station buildings have also been practically completed. Leaving the new joint station at Barnstaple the line at once enters the valley of the Yeo, which it follows for about six miles, in its course traversing a viaduct at Chelfham, then skirting for several miles the Bratton valley, and then, rising to its highest point, Blackmore, where from the height of 1,000ft. the first glimpse of the Bristol Channel is caught. The line descends from Wooda into the valley of the West Lynn by an easy gradient till the terminus of Lynton comes into view. The rails weigh 40lb. to the yard, with sleepers 3ft. apart; the sharpest curve being five chains, and the deepest gradient is 2 per cent. Mr. Frank Chant is the engineer of the line. The engines are by Manning and Wardle, of Leeds, and the rolling stock is supplied by the Bristol Waggon Works Company.

NEW YORK.—The proposal to erect a bridge over the East River between New York and Brooklyn has reached a definite stage towards actual execution, as separate tenders are invited by the commissioners for its erection for the construction of the two anchorages. These anchorages are about 150ft. by 180ft. each, and 100ft. above high water, the foundation being piles and timber grillage. They contain about 50,000 cubic yards masonry each. They will be faced with granite. Each anchorage will require about 1,600 tons of steel girders, eye-bars, and pins. The estimated cost is about £145,000 sterling. The time allowed for the work is 16 months. The tenders were to be opened on Wednesday in this week, the 22nd inst.

NORTH CORNWALL RAILWAY.—The report of the engineers, Messrs. Galbraith and Church, presented to the shareholders at their meeting yesterday (Thursday), states that the staking out and preparation of the plans of the extension to Padstow, $5\frac{1}{2}$ miles in length, were proceeded with directly the arrangements for the construction were completed. The contractors, Messrs. Curry, Reeve, and Co., commenced work at Little Petherick Creek, in February last, and as further land was obtained, started on other parts of the line. The present state of the work is as follows, viz.:—Possession of land has been obtained for a length of $4\frac{1}{2}$ miles, a considerable portion of which has been fenced; excavation is proceeding in twelve cuttings, and a commencement has been made with the masonry bridges, one of which is nearly completed. The temporary timber viaduct over the part of Little Petherick Creek to be bridged has been completed, and the embankment brought up to one end. The permanent iron viaduct has been let, but the erection cannot be commenced until the remainder of the embankment has been finished. Arrangements are being made to proceed shortly with the station building at Padstow.

PROPOSED LIGHT RAILWAY TO INVERARY.—The Light Railways Commissioners held an inquiry at Tarbet on Monday into an application by the West Highland Railway Company for permission to construct a light railway between

Arrochar, Loch Long, and St. Catherine's, opposite Inverary on Lochfyneside. The length of the line will be 18 to 19 miles, and the estimated cost £110,000. Mr. Cooper, Edinburgh, who appeared for the promoters, pointed out in his opening statement that Inverary was at present absolutely cut off from railway communication with the outside world. A number of witnesses were examined, and the evidence showed that feeling in the district generally was very greatly in favour of the scheme. Two proprietors, through whose grounds the line will pass, strongly objected to its being unfenced. Mr. Westland, partner of the firm of Blyth and Westland, civil engineers, Edinburgh, the engineers of the railway, stated that the steepest gradient was one in fifty, and the sharpest curve eight chains. The gauge was the ordinary $4\frac{1}{2}$ ft. gauge. At St. Catherine's a pier was to be constructed at a cost of £5,000, and would end in 10ft. of water. The line began 160ft. above sea-level, and rose to 860ft. The only point of difference with the landowners was the question of fencing. The company were prepared to fence arable land, but he thought it would be needless to fence moorland. The trains would go at within 15 miles an hour. If they were to fence all, the cost would be about £300 per mile. At the close, the Earl of Jersey, who presided, said the Commissioners were prepared to recommend the granting of an order for the line, but would delay decision on the question of fencing in the mean time.

CHIPS.

In the current issue of the *Western Figaro*, our old correspondent, Mr. Harry Hems, of Exeter, graphically and humorously describes his recent "Wanderings in Brittany and Finisterre." Six weeks were spent in a tour to St. Malo, up the pretty river Ranch to Dinan, by rail to Brest, diligence to Du Conquet, and by steamer to Ushant, returning by the same route.

The corporation of Aberdeen have adopted as the site for the statue of Hygieia, about to be erected to the memory of Miss Duthie, a point just above the Lower Lake in the Duthie Park.

The corporation of Tunbridge Wells are contemplating spending from £80,000 to £100,000 in municipal buildings. The local Improvement Association have passed a resolution begging the corporation not to intrust the work piecemeal to the officials, but to invite competitive designs from architects, offering three substantial premiums for the selected plans.

The Devonshire County Council finally adopted at their meeting last week a scheme for the future maintenance of main roads submitted by a committee. Under this the county will be divided into three districts, for each of which a county surveyor, three assistant surveyors, and five foremen will be appointed.

At Wemyss Castle, N.B., a private memorial chapel has been constructed and fitted up in the basement from designs by Mr. R. S. Lorimer, architect, of Edinburgh. A monument to the late Mrs. Erskine Wemyss has been built into the north wall; it is surmounted by a panel showing a swan supporting a shield, on which is carved the lion rampant—the crest of the family. Here will be placed a recumbent effigy of the late Mrs. Wemyss, which is being executed by the Princess Louise. The windows are to be filled in with stained glass illustrating the life of St. Margaret of Scotland.

A recreation ground of $5\frac{1}{2}$ acres, provided by the corporation of West Bromwich, for the benefit of the inhabitants of the Hill Top Ward, was opened by the mayor on Monday. The grounds, which adjoin the highway between West Bromwich and Wednesbury, have been laid out, from plans by the borough surveyor, Mr. A. D. Greatrex. The foundation-stones of the various buildings, including free library, fire, and police stations, which are to occupy a portion of the property, were also laid by the mayor. They will also be built from Mr. Greatrex's designs, and the contract for their erection has been taken by Messrs. Smith and Son, of Hill Top, at £3,200.

The pavilion and a cluster of smaller buildings, including a refreshment-room, shops, shelters at the seaward end of Southport pier, were burned down on Saturday night, and some thirty or forty yards of the wooden "deck" of the pier was destroyed. The damage is put at about £5,000. The pavilion, which was built nine years ago, was 70ft. by 50ft., with a height of 35ft., and was seated for an audience of over 400. The structural loss is covered by insurance. Already the directors have consulted an engineer with the view to preparing plans for a larger pavilion and other buildings and the general improvement of the pier.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

GLASGOW ARCHITECTURAL ASSOCIATION.—On Tuesday evening, the 14th instant, the vice-president, Mr. G. S. Hill, A.R.I.B.A., in the chair, Mr. Jas. A. Morris, F.R.I.B.A., I.A., the honorary president, delivered a lecture on "Attainable Ideals." Mr. Morris had on the walls a unique collection of working drawings which he had specially obtained from some of the leading English architects, including the late John D. Sedding, John Belcher, Ernest George and Peto, Ernest Newton, C. F. A. Voysey, R. Schultze, Balfour and Turner, and Dunn and Watson. The lecturer, after expressing his gratefulness for the honour done to him by the Association in electing him as its honorary president, took the drawings around him, which he said were better than many lectures, as his theme. He said: "The good influence of John Sedding for purity and gentleness, love of his art and mankind, and all that goes to the making of a true and simple artist will not 'be interred with his bones.' His drawings upon our walls show abundantly his vivid imagination, his keen desire for perfection and the infinite labour he gave in seeking it, his nervous directness of touch, his refinement, breadth, simplicity, and power." He was sorry that he had no drawings by Norman Shaw, who had written him that drawings were only a sort of alphabet with which to instruct the builder, and when he was done with them they should be burnt as apt to mislead people. The lecturer maintained that high ideals and noble thoughts would elevate and ennoble an architect's work, however great the influences restraining him were. He advised his hearers to study from nature; to learn the subtle beauty and strength of the human figure, which was a mine of purest gold, inexhaustible in its richness; to seek dignity among the mountains and by the sea. From these they would learn that the greatest dignity was ever the simplest. "And," he said, "if you once receive that truth and become imbued with it, your buildings, be they great or little, must ever also partake of the same power. The desire for this unseen perfection, this subtle excellence and beauty so near and yet beyond our grasp, this wisdom, this mystery, inspires alike the artist, the poet, the scientist, and the seeker in all walks after truth." The old fairy tale of the "Ugly Duckling" was capable of many adaptations, and the time might be near when architecture, like that unfortunate fowl, driven from pillar to post, jeered at, misunderstood and despised, because often ugly and ungainly, might once again become the beautiful swan. Mr. Alex. McGibbon proposed a vote of thanks to the lecturer. The Chairman, after expressing the sincere gratefulness of the Association to the architects who had lent their drawings, seconded the vote of thanks, which was heartily accorded. Through the appreciated kindness of their senders, the drawings remained on exhibition till Saturday.

FISHPONDS ASYLUM.—The following resolution was unanimously carried at the last meeting of the Bristol Society of Architects:—"That this society regrets to learn that the committee of the Bristol City and County Lunatic Asylum have appointed a clerk of works instead of an architect to carry out the proposed extension to the asylum. It seems that the committee are sanctioning an expenditure much above what is usual in this class of building, and that the amount per bed will be practically double what it should be, considering that the administrative buildings are already erected. This society considers it is not in the interests of the ratepayers that for a building involving such a large expenditure of public money the services of a properly-qualified architect should not have been retained."

A step is now to be made in connection with the development of Seascale. A Llandudno gentleman has bought land on which to erect a high-class hotel, the contemplated expenditure being about £20,000.

An art exhibition was opened on Monday at the Hull Royal Institution, and is intended to remain open for the next month. It is of a loan character, and contains a large number of pictures by local artists, many being of considerable merit. The promoters are working with the object of ultimately establishing an art gallery of a permanent kind in Hull, and have on two previous occasions held exhibitions like the present.

PASSMORE EDWARDS FREE PUBLIC LIBRARY, ST. GEORGE'S IN THE EAST.—COUNTRY HOUSE, BATH.—WALL-PAPER DECORATIONS, BY MESSRS. JEFFERY AND CO.—HOUGHTON TOWER, LANCASHIRE.—YORK UNION BANK, HULL.—OFFICES, YORK STREET, GLASGOW.—THE PALAZZO PESARO, VENICE (A.D. MDCLXXIX).

Our Illustrations.

PASSMORE EDWARDS PUBLIC LIBRARY, ST. GEORGE'S IN THE EAST.

ON Wednesday next, Michaelmas Day, the Right Honourable C. T. Ritchie, M.P., President of the Board of Trade and late Member for the Tower Hamlets (St. George's), will lay the foundation-stone of this new building, which is in course of erection, at the cost of Mr. J. Passmore Edwards, on a corner site in Cable-street with a return frontage in Prospect-place. We gave the plan when the architect's Royal Academy view of the library was published in the BUILDING NEWS for May 21 last. The accompanying illustration is reproduced from the half-inch scale detail of the elevation. Portland stone is being used for the entrance, &c., with Messrs. Lawrence and Sons' No. 4 red facings for the brickwork. The first floor is to be finished in lime stucco with oak oriel windows, over which a pent, in steel and concrete, will give an effective shadow. The quarry glass is to be by Messrs. Aldam Heaton and Co., the fireproof flooring and staircase by Messrs. Homan and Rodgers. Messrs. W. Johnson and Co., of Wandsworth, are the builders, and Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

COUNTRY HOUSE, BATH.

THIS house is in course of erection at Bath, from a design by Messrs. T. B. Silcock and S. S. Reay, of Bath. The walling consists of Combe Down stone range-work and dressings, and the roof was originally intended to be covered with Whitland Abbey slates. A small stable, with a billiard-room over, has been added to the office wing, but does not appear on the illustration. The work, so far, has been excellently carried out by Mr. William Webb, of Bath, and under the able supervision of Mr. J. Bowden, clerk of works. The drawing here reproduced was exhibited at the recent Royal Academy Exhibition.

MURAL PAPER DECORATIONS.

THE accompanying sheet illustrates some new designs made this year by Messrs. Jeffery and Co., of Islington, in a variety of choice and artistic colourings. "The Diana" frieze, from the pencil of Mr. Ingram Taylor, is a spiritedly-drawn composition, with running figures introduced, intermingled with a boldly-patterned scroll running in an opposite direction, and rising from a sufficiently broad band of delicate leafings, which furnish a ground line for the figures and mask the starting points of the scrolls. The right-hand wallpaper, called "The Aberdeen," is designed by Mr. H. W. Batley. The central one, "The Montrose," is by Mr. Sidney Haward, in a Persian mode of treatment, and

"The Haarlem" is a more naturalesque rendering of flowers. These, however, are nicely conventionalised, and very prettily drawn.

HOUGHTON TOWER, LANCASHIRE.

THIS building is being altered and renovated just now under the direction of Mr. Oliver, an architect who, from all accounts, has an appreciation of the charm of the old mansion with which he is dealing. We published some measured drawings of the hall shown in the accompanying sketch on the 3rd inst., and on August 20 last another point of view was chosen for a photograph. Mr. H. Harrington's pen and ink drawing now given represents the other side of the quad, and the archway leading out of it. The notes already given concerning the house, when we recorded the late visit of the Architectural Association, leave nothing to add on this occasion.

THE YORK UNION BANK.

THIS building was completed some short time ago, and was built for the York Union Banking Company. It is built of Ancaster stone, with a polished red granite base. The roofing is of Staffordshire tiles. The site being a corner one, the main entrance is the feature of the building; this has a large amount of carving, which was executed by Mr. Gilbert Seale, of London. The contractor was Mr. F. Blackburn, of Hull. Messrs. Smith, Brodric, and Lowther, of Hull, were the architects.

OFFICES, YORK STREET, GLASGOW.

THIS block of offices is being built in York-street, near the river, for Messrs. P. Rentoul, Son, and Co., the stone used being from Locharriggs, Dumfriesshire, the roof being covered with Elder-water slates. The builders were Messrs. Alex. Mawson and Sons, and the architect is Mr. W. F. M'Gibbon, 221, West George-street, Glasgow.

THE PESARO PALACE, VENICE.

THESE details, so carefully delineated, which we illustrate this week, show the canal front portals with their steps down to the water from the famous Pesaro Palace, Venice, one of the most beautiful of the whole series of buildings left us of the Later phase of Venetian art. It is certainly distinctly a typical example devoid of any marked blemishes, with nothing added to its façade for mere display, though some have described it as being over-ornamented. It is a remarkably elegant and handsome specimen of palatial work varied in rich and appropriate design from water-line to the cornice. The basement stage is exceedingly refined, and, possibly, would have gained by a more sturdy treatment. The need for this hardly asserts itself in the partial elevation which we give. The drawings will be valued for their fidelity and care. They are taken by permission from the singularly comprehensive work lately issued by Mr. Ernst Wasmuth, of 35, Markgrafenstrasse, Berlin, under the title of "Palast-Architektur von Oberitalien und Toscana," a fine folio of photographs and specially-prepared drawings made under the direction of Mr. Otto Raschdorff, architect, of Berlin.

MOST serious damage has occurred, says *Indian Engineering*, to the palace at Cooch Behar, built from designs by Mr. E. J. Martin, F.R.I.B.A., and extensive rebuilding is unavoidable.

THE Duke of Norfolk, as Lord Mayor of Sheffield, has arranged to open the newly-erected quarters for aged couples at Sheffield Workhouse on Oct. 6. This work completes the important scheme of workhouse reform carried out by the Sheffield Guardians. The pauper children do not come in contact with the workhouse, but are brought up by foster parents in homes scattered about the city suburbs. The quarters of the old couples are to resemble, as nearly as possible, their own homes.

THE largest clinical amphitheatre yet built in the United States is said to be that just erected for the Medico-Chirurgical Hospital at Eighteenth and Cherry-streets, Philadelphia, for the purpose of affording opportunities of clinical instruction to medical students. Messrs. Frank Miles Day and Brother were the architects of the building, and Messrs. Francis Brothers and Jellet (Inc.), of Philadelphia, were the consulting engineers for the mechanical features. The building is constructed of fireproof materials throughout, the flooring being of concrete arches on I-beams. The floors and wainscots are of marble. All the plastering is finished in enamel, and woodwork has only been used in the doors and windows. The seating capacity of the amphitheatre is about 500.

COMPETITIONS.

RUGBY.—At the meeting of the urban district council on Thursday night in last week, plans were adopted for the municipal buildings to be erected in High-street, on the site of the Old Shoulder of Mutton Inn, which, together with £4,000, was left to the town by the late Mr. G. C. Bain for the purpose. The designs accepted were prepared by Messrs. North and Hawk, architects, Battersea, and a Mr. Parnell said they were pre-eminently the best of the thirty-nine sets of plans sent in. The plans to which the second premium was awarded were prepared by Mr. D. Bird, of Manchester.

DUKINFIELD.—At a meeting of the building committee for the erection of a new Town Hall, it has been decided to invite competitive designs and offer premiums for the best plans. The cost of the new building is to be from £7,000 to £8,000. It is to be erected on the market ground in the centre of the town, with a frontage to the principal thoroughfare. This scheme, in conjunction with the new-recreation ground recently determined upon, represents the town's commemoration of the record reign.

CHIPS.

Extensive alterations are being made to the King's Arms in the Mile End-road, at a cost of about £2,000, from plans by Mr. Herbert Riches, of 3, Crooked-lane, E.C., architect.

It is announced in the *London Gazette* that the adjudication in bankruptcy against Henry Adams, of Tunbridge Wells, builder, has been annulled.

At Radstock, Somerset, the Working Men's Hall is being converted into a Jubilee Institute at a cost of £1,100. Mr. Joseph Bird, of Radstock, is the contractor.

The mansion of Pitthadden, near Aberdeen, is being enlarged and redecorated under the direction of Mr. Williamson, of Bendauch.

The great extensions of the railway station at Crewe, which are now being pushed forward at the Stafford end of the station, are giving employment to a large number of men. Tunnelling the railway is now about to be undertaken, a tunnel right underneath Crewe station having to be formed so as to give more room for the conduct of passenger traffic through the station without the interference of goods trains. The work is expected to last over three years, and the total cost is said to be likely to total up to £300,000.

Professor Hubert Herkomer, R.A., proposes to paint a large picture for exhibition at the Royal Academy of the Gorsedd ceremony, with the arch-druid Hwfa Mon wearing his official robes on the Maen Llog, and the other officers in their new robes and hoods which have been designed by Professor Herkomer. The bards, druids, ovates, musicians, and several of the honorary members of the Gorsedd are to be invited so as to make the gathering as representative as possible, and they will meet in the grounds of Plas Coch, near Llanfair P.G., Anglesey. The ancient cromlech in the grounds of Plas Coch is to form a background for the scene, and unhewn stones will be provided to form the druidical circle.

THE Hon. Walter Rothschild formally opened the new synagogue in Mare-street, South Hackney, on Sunday. The buildings comprise, on the lower ground floor, a hall convertible into nine classrooms for the teaching of religion, provision being made for 300 children. The ground floor contains the main body of the synagogue, and the first floor is devoted to the ladies' galleries. There is seating accommodation in the synagogue for 900 souls. The external design is carried out in red brick and artificial stone. The interior is painted in pure white, the woodwork being in imitation of old oak. The cost of the freehold site and of erecting the building, which was built from the designs of Mr. Delissa Joseph, F.R.I.B.A., amounted to about £8,000.

ON Saturday a new font, pulpit, and bells, that had been added to the church of St. Paul, which Sir Charles Seely has built for the new parish of Daybrook, were dedicated by the Bishop of Derby.

IN the course of the excavations which are being carried out at Furness Abbey, a bulla, or leaden seal, which must have come from Rome during the 13th century, was found at the south-western corner of the ruins, near where the great hall stood, and where the Bull to which it was attached was probably kept. It is almost circular in shape, about the size of a crown piece of the present day, but somewhat thicker. Five Bulls were received at the Cistercian establishment during the reign of Pope Innocent IV., and whilst William de Middleton was Abbot of Furness.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) for any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 6s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LIII., LIV., LV., LVI., LVII., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

S. S. RAYLEIGH, R. G. L., E. G., and OTHERS.—When reviewing in our issue of the 27th ult. "The Art of Tracing," by E. W. Fritchley, architect, we omitted to mention that it is published at the Education Society's Steam Press, Bombay. It is a thin duodecimo of 54 pages, bound in stiff cloth boards; no price is named. We do not recall a book exclusively dealing with the subject published in England.

RECEIVED.—W. S. B.—L. T. D.—H. G. D.—S. S. and Co.—R. K. N. and Son.

Correspondence.

POOR MORTAR.

To the Editor of the BUILDING NEWS.

SIR,—Your correspondent, "A. H.," (BUILDING NEWS, September 3, says of clayey earth in a mixture of sand and lime to make mortar, that "the particles are soon dissolved by the action of rain and disintegrated by frost." This does not accurately describe what happens when mortar made with such materials is exposed to the weather, for alumina (clay) is insoluble in water. This mortar is first disintegrated by frost, and the clayey particles are subsequently carried away in suspension by rain-water. If the lime happens to be burnt from some nearly pure limestone it will be dissolved gradually by the lime, but lime is sparingly soluble in water. Your correspondent goes on to say, "If only clean, sharp sand, be used, free from clay, then the bricklayer cannot cheat the mortar of its proper quantum of sand." I presume he means that the bricklayer cannot cheat the mortar of its proper quantum of lime, which is a very different thing; again, he says, "Take care of the cleanness and sharpness of the sand, and the (quality of the) lime will take care of itself." Here, he evidently means the quantity of the lime, for the addition of sand, clean or dirty, in large or small quantity, can in no way affect the quality of the lime, which remains the same in any case, though the quality of

the mortar does not. Without any desire to be critical, it appears as if your correspondent's letter was the outcome of a confusion of ideas, assuming there are no printer's errors in it.

On page 398, BUILDING NEWS, September 17, another correspondent, writing on the same subject, says: "Limestone, when burned, becomes oxide of lime (CaO), chemically called 'calcic oxide.'" There is no such substance as "oxide of lime," lime, as your correspondent immediately adds (and subsequently) being itself the oxide of calcium. He explains that the setting of lime mortar is due to the reconversion of its slaked lime into the limestone from which that lime was derived by calcination, and, having partially explained this phenomenon, he proceeds to say that the setting is due to the simultaneous formation of silicate of lime which binds the particles of sand together apparently with an intensity in proportion to the quantity of silicate formed. The value of this explanation is, to some extent, discounted by the introduction to it, which says that the interaction of the lime and sand is "something on this basis." Will your correspondent kindly give your readers the result of his analysis of some "old Roman" mortar? This will determine to what extent lime becomes re-carbonised after 2,000 years, and what proportion of sand combines with lime to form silicate of lime? Your correspondent's meaning is obscure when he says the early fresco painters put lime in pits "so as to cause it to lose its causticity by the gradual expulsion of the CO₂." He has already stated that lime is "CaO." Where, then, does the CO₂ come from, which this lime is supposed to lose in the pits?

This method of writing is unfortunately a characteristic of too many writers on building matters when they touch on scientific subjects. For instance, a recently-published voluminous work on "Plastering" contains the following valuable piece of information: "Sand is the most widely distributed substance in nature, not only in the mineral, but also in the animal and vegetable kingdom." If, for sand, silica is understood, the first portion of the sentence is unobjectionable, not otherwise. Taking man as the highest type of animal, and a fitting representative of the animal kingdom, one is at a loss to know where sand is widely distributed in him. Men sometimes are afflicted with gravel, which is only a coarse kind of sand; but, that a man of fourteen stone weight should have about seven stone of sand "in the belly of him," as Carlyle would say—that is, to make it the most widely distributed substance in him, seems almost incredible. Not being a physician, the writer cannot say more than express the belief that such a case would be a very critical one indeed. With regard to the vegetable kingdom, one can only ask, Do the vegetables grow on the moon, that burnt-up cinder, or on Mars, or Jupiter, with sand widely distributed in them? for they certainly do not grow on this planet. Our vegetables have carbon for their most widely distributed substance, and this they obtain from the atmosphere by the decomposition of its carbon dioxide. Again, in a very valuable book, on "The Trees of Commerce," we are gravely informed that oak-trees are particularly abundant in the Isle of Portland, in the limestone known as "Portland stone." Now, it is difficult to determine if the writer refers to the "dirt bed," which is remarkable for its numerous tree stumps, and was once classed as a "Portland" rock, though now it is considered to be the base bed of the Purbeck series, or to the underlying "Portland" beds; in either case, there is not a single oak-tree found fossil in them, for the simple reason that oaks were not "invented" at the time. They are first found (probably some million years later) in the Middle Eocene rocks. The Jurassic architect must then have been content to build with the aurocarica and one or two other conifers of no importance, for even Memel, Dantzic, and Riga fir, let alone Baltic timber, or that from the White Sea, had not yet been put upon the market! The following interesting information is given in a book on building, published many years ago, and is too good to be lost to your readers. "Jabal was the first that wrote on this subject" (geometry), and which he performed with his brethren, Jubal, Tubal Cain, and Naamah, who, together, wrote, in two columns, the arts of geometry, &c., which were found (after the flood of Noah) by Hermapines, "a descendant from Noah," and probably the founder of the hermapines! Abraham was also a geometer, and when he went into Egypt he taught Euclid the

science of geometry!" Whether this Abraham was the "father of the faithful," or the Abraham after whom the celebrated heights outside Quebec are named, the writer does not say; but he might have condescended to inform his readers how Abraham, if he was of that ilk from Canaan, and who died 2,000 years before Christ, could possibly have taught Euclid, who was born only about 300 years before Christ.—I am, &c.,

W. E. M.

CHIPS.

Arrangements have been practically completed for the removal, next month, of the Government laboratory from Somerset House to the new premises, near Clare Market, off the north side of the Strand.

At the annual prize distribution of the Liverpool School of Science, Technology, and Art, held on Friday, it was reported that in the Liverpool School of Art and the School of Architecture and Applied Arts, conducted by Professor F. M. Simpson, the total in day and evening classes last session was 630 students.

Mr. Andrew Carnegie has offered to provide a technical school for Dunfermline and district, and a meeting of the Burgh School Board will be held shortly to consider his offer of £7,000 for the purpose of carrying out the object in view.

A new fountain is to be erected by Mr. Astor in the grounds at Cliveden. It is to be composed of marble from Naples, a dozen blocks, each weighing about 12 tons, having been landed from barges at Maidenhead.

The will of Miss Jean Ingelow, the novelist, of 6, Holland Villas-road, Kensington, who died on July 20, has been proved by Mr. Benjamin Ingelow, F.R.I.B.A., of Carlton Chambers, Regent-street, the brother and sole executor, the value of the personal estate being £6,018.

The organ in the well-known Saxon and Early English church at Barnack, Northants, was reopened last week after having been rebuilt by Messrs. Walker and Sons, of London.

At the Mansion House Justice-room on Saturday, William T. Hooker, aged 53, a builder at Shirley, near Southampton, was charged with publishing a libel on Sir Walter Pridaue, clerk and solicitor to the Goldsmiths' Company. The prosecution arose out of a dispute between the complainant and the Rev. Canon Jones on the one hand, as trustees of some property at Shirley, and the defendant on the other, and it was stated that the latter had subjected them to a course of persistent slander and abuse. Alderman Sir H. Knight remanded him, agreeing to take bail.

Some months ago a considerable portion of the plaster on the north side of tower of Wren's church of St. James, Garlickhithe, E.C., was stripped off owing to the heat to which it was exposed by a fire on the opposite side of the street. Upon examination, it was found that the original masonry of the tower remained practically intact, and that at some period the whole had been covered with plaster. The remainder of the tower is now being cleared of plaster.

An inquest was held last week at the Swan Inn, Fradley, Staffs, on the body of William Henry Wright, 31, of 40, Lombard-street, Lichfield, and manager for the firm of Messrs. Joseph Wright and Sons, builders, whose body was found in the canal at Fradley Junction on the previous Saturday morning. A verdict of suicide whilst of unsound mind was returned.

Colonel Slack, of the Local Government Board, held an inquiry at Wilslow on Friday respecting the application of the Wilslow Urban District Council for sanction to borrow £3,000 for further sewerage works, and £400 for fire-brigade purposes. About £23,000 has now been borrowed by the council for their sewerage works.

A fire broke out early on Sunday morning in a timber yard and saw mills belonging to Mr. J. Thompson, situated in Bacon-street, Bethnal Green. The mills and timber were nearly destroyed, and a house that was occupied by Mr. Thompson was seriously damaged. A building, about 30ft. by 30ft., used as cabinet makers' workshops by P. Levy, was severely damaged.

Col. W. L. Coke, M.Inst.C.E., an inspector of the Local Government Board, held an inquiry at the Town Hall, Chester, on Thursday in last week, as to an application by the corporation for sanction to borrow £20,000 for electric-lighting purposes, £4,100 for the purchase of 20 acres of land at Beech House for sewerage disposal, £2,340 for the completion of the Foregate-street improvement. There was a further application for approval of the appropriation of sums amounting to £4,770 to be received upon the sale of corporate lands or consolidated stock towards the cost of erecting buildings at the Cross, and of purchasing the Dee Mills.

Intercommunication.

QUESTIONS.

[11790.]-**Fences.**—Will any of your readers kindly state whether any rule or custom exists to distinguish the ownership of garden fences? Should the heads or the points of the nails for fixing the palings be on the side of the owner of the garden?—R. W. H.

[11791.]-**Building By-Laws.**—Can any of your readers inform me if there is any legislation defining the respective rights of building and adjoining owners of party-walls in districts outside the County of London, in a similar manner that Part 8 of the London Building Act governs such cases inside the county? I can find no reference to any such legislation in any local by-laws.—P. H. A.

[11792.]-**Architectural Book.**—I have in my possession a work on design published in London in 1755, called "Architecture improved in a collection of modern, elegant, and useful designs, in the taste of Inigo Jones, Mr. Kent, &c., all curiously engraved on 50 copper plates, octavo. Designed by Robert Morris, surveyor, late of Hyde Park-street, London. Sold by Robert Sayer, opposite Fetter-lane, Fleet-street. M.D.C.C.L.V. (Price, 7s. 6d.)." I should be glad if any reader could inform me whether this book is of any value, on account of either its age or rarity as an architectural curiosity?—INIGO.

[11793.]-**Portland Cement.**—I saw in the BUILDING NEWS of last week some matter upon "Plasters, Cements, and Mortars," which is very useful, and I should be extremely obliged if "H. C. S." would kindly inform me upon the following:—How to intensify the setting and impermeability of Portland cement so as to render it weatherproof, for use on flat roofs, fall 1in. in 10ft.? I am trying diluted silicate of soda, applied on the surface while the cement is setting; but am anxious to know whether there is anything still better.—MUCH INTERESTED.

REPLIES.

[11781.]-**White Plaster.**—In the construction of walls, plaster of Paris is used in that city externally as well as for inside uses; but for half-timber work, the kind of plaster known as "rough-cast" should be used. The wall should be first pricked up with lime and hair, and a second coat applied. During the process of this second coat, rough-cast should be applied, which adheres to the wet coating just put on. It is made of pure lime and water in a half-liquid state, and small well-washed gravel is mixed with it. This mixture is thrown from a pail on to the wall with a float. Of course, any colour can be given to the coat.—G. H.

[11784.]-**Office Routine.**—The best way of learning this is in an office. Building accounts have been treated in a recent book, which was noticed in the BUILDING NEWS some time ago, but I forget the name. The filing of correspondence is not a very difficult matter, letters should be classified and indexed, and every architect and surveyor has his own way of doing this. I am not aware of any books treating this subject.—A STUDENT.

[11787.]-**Damp-Course.**—There are several kinds of damp-course—vitrified glazed ware with perforations laid in thin slabs, slates in cement, thin lead, asphalt. To insert a damp-course in an old brick house, I should advise cutting out a course of bricks a foot or two at a time, and inserting either a layer of 4lb. milled lead, or, better still, Taylor's damp-proof course of stoneware, perforated. These slabs are made for 15in., 14in., and other thicknesses of wall. Jennings has also a patent sleeper block of earthenware.—G. H. G.

CHIPS.

The foundation-stone of a parish room for Christ Church, St. Alban's, Herts, was laid last week. Mr. H. E. Hansell is the architect, and the building is of grey bricks with dressings of red Corshill stone. The chief room will be 42ft. 6in. by 27ft. Messrs. J. and W. Savage, of Lattimore-road, St. Alban's, are the builders, and the cost will be about £800.

For the office of surveyor of highways to the rural sanitary authority of Cheadle, at a salary of £150 per annum, there were 26 candidates. The voting at the last meeting of the council resulted in the election of Mr. W. P. Inskip, of Cheadle.

The Bishop of Gloucester has fixed Wednesday next (Michaelmas Day) for the reopening of the Lady-chapel of the cathedral which has been restored at a cost of £10,000. Evensong will be sung unaccompanied, the choir being placed in the minstrel galleries, which have not been used for such a purpose for 400 years.

Thanks to the liberality of Mr. C. D. E. Fortnum, the collection of fictile ivories which was the result of Professor Westwood's life-long researches has been acquired for the Ashmolean Museum at Oxford.

On Monday a memorial bust of the late Dr. Gilbert Ward, of Blyth (1805-95), was unveiled in the hall of the Thomas Knight Memorial Hospital, at Blyth. The bust is composed of white marble, and stands upon a pedestal of green marble. The work was done in Venice, from a photograph, by Antonio Frilli.

The memory of the late Archbishop of Canterbury, Dr. Benson, has been honoured in Danluc Parish Church, Bushmills, where he administered his last Communion a week before his sudden death, by the erection of a new chancel, which was dedicated on Thursday evening in last week by the Primate of Ireland, Dr. Alexander.

LEGAL INTELLIGENCE.

BREACH OF BUILDING BY-LAWS.—Charles Grant and James Grant, of the Waterloo Sawmills, Burslem, were summoned to the Burslem Police-court on the 14th inst. for a breach of the borough by-laws in allowing two new dwelling-houses, situate in Furnival-street, Burslem, to be occupied without obtaining a certificate from the surveyor certifying the houses to be in every respect fit for human habitation on the 3rd and 9th of August, and on subsequent dates. Mr. A. Ellis, town clerk, appeared for the prosecution, and Mr. Abberley for the defendants. Mr. Joseph Boulton, building inspector, proved the case. Mr. Abberley pleaded guilty to a technical offence, and explained that Messrs. Grant complied with all the requirements of the buildings inspector with the exception of one matter—viz., the provision of a certain down-spout. The foreman omitted to inform Messrs. Grant on the Stokes Wakes Saturday, when the matter was mentioned. The tenants had been given permission to go into the houses for their own convenience in Wakes week, and they did not commence to pay rent until some time afterwards. Fined 10s. and costs—£1 4s. altogether.

CASE UNDER THE BUILDING ACT, SECTION 74 (2).—The case of A. Payne, District Surveyor of East Hackney (South) and North Bow, versus Simpson and Cove, builders, was heard before Mr. Dickinson at North London Police-court, Sept. 16. Defendant had made alterations and additions to a public-house, Devon Arms, 53, Morning-lane, Hackney, exceeding 10 squares in area, and had formed an approach from the back leading to the bar and the staircase for the use of the dwelling-house without fitting the opening between the said approach and the bar with fire-resisting doors. The defendants replied that they were carrying out the instructions of the architect, who said the doors were not necessary. The defendants were fined 10s. and 12s. costs, with an intimation that they would be liable to a further penalty if the doors were not placed there. This agrees with recent decisions on the point.

THE LIABILITY OF LANDLORDS.—CLARKE v. LONDON.—Mr. R. E. Clarke, builder, 16, Finsbury-pavement, brought an action, in the City of London Court on Friday, before Mr. Commissioner Kerr, against Mr. F. London, 170, Edmund-street, Birmingham, to recover the sum of £10 2s., work done at and materials supplied to 85, Finsbury-pavement. The solicitor for plaintiff said that Messrs. Tillet and Yeoman had the premises in question in their hands to manage for the defendant. The premises had been vacant, and Tillet and Yeoman obtained a tenant who was prepared to take the premises subject to certain repairs and alterations being done. Thereupon the plaintiff was supplied with a specification by Tillet and Yeoman of the work which was to be done. That amounted to £85. During the progress of the work one of the sanitary inspectors of the City came to view it, and he insisted upon certain other work being carried out beyond that which appeared in the specification. Of course the plaintiff was bound to do the work, and he now claimed £10 2s. for it. Mr. Aldous said the defendant had paid the £85 originally agreed upon for work which he had ordered to be done. He gave no order for the work amounting to £10 2s., and therefore he did not see why he should be called upon to pay for that which had been done without any authority on his part. His Honour did not think it mattered whether the defendant had given the order or not. If, he said, the sanitary inspector required work to be done, then the landlord could not help himself. Mr. Aldous: We cannot be made liable for the work unless we give the order. His Honour: Yes, under the Sanitary Acts, you can. Mr. Aldous argued that, as soon as the sanitary inspector required extra work to be done, the plaintiff surely should have communicated with the defendant, and asked whether the work was to be done or not. His Honour said the sanitary inspector would have taken the defendant before a magistrate, and the magistrate would have made the order. It was useless to oppose things of that sort. Mr. W. H. Gathercole, one of the sanitary inspectors under the Commissioners of Sewers, was called, and spoke to visiting the premises in question. He said he gave the plaintiff to understand that the extra work which had been done was necessary. He could not have passed the work specified for without requiring the extra work to be done. In cross-examination, he admitted that he had served the defendant with no written notice requiring the extra work to be done. That was because the work was done without his having to proceed to the length of giving a written notice. Mr. Aldous submitted that the owner of property was not liable for repairs ordered by a sanitary inspector until written notice had been given. His Honour said the written notice was not necessary. The inspector went to Messrs. Tillet and Yeoman, and told them that the extra work must be done. Messrs. Tillet and Yeoman were the agents of the defendant, and therefore they had authority to get the work done. The defendant could not get out of it. Judgment was entered for the plaintiff, with costs.

WATER SUPPLY AND SANITARY MATTERS.

FARNBOROUGH.—The Thames Conservancy Board have applied for and obtained summonses against the urban district council of Farnborough, Hants, for polluting the river Blackwater by their sewage farm. Mr. Radford, C.E., about twelve months ago prepared plans for a thorough system of drainage, and for dealing with the sewage on the confines of the district instead of in the centre, where the present small and inadequate farm is situated. This scheme, which was adopted, was estimated to cost £30,000. It was opposed by some of the council, but the Local Government Board, after an inquiry, agreed to grant a provisional order. At the last election, however, the Anti-Drainage Scheme party obtained the victory. They refused to proceed with the order, and they have since been experimenting with different systems. They have obtained a report on a septic system, and negotiated with the inventor for a scheme which he offered to carry out for about £4,000. But the Chairman of the Council, who was on the Bench when the summons was granted, gave an assurance that another scheme would be adopted that night at the meeting of the Council, and on this assurance the Chief Inspector of the Conservancy agreed to hold over proceedings for another three months. This scheme is by Messrs. Martin, Wells, and Co., contractors, of Aldershot, who agree for between £2,000 and £3,000 to lay down tanks for septic treatment, to take the whole responsibility of the management of the existing farm for three years, and to produce an effluent that shall be satisfactory to the Conservators. A plan is to be also prepared for the drainage of the large portion of the district which is at present undrained.

MANCHESTER AND ITS SEWAGE-DISPOSAL DIFFICULTIES.—A special meeting of the Manchester City Council was held on Friday to consider the expediency of promoting a Parliamentary Bill to authorise the corporation to construct a culvert to convey the effluent of the sewage of Manchester, after chemical treatment and precipitation, from the works of the corporation at Dayhulme into the river Mersey at Randle's Sluices, a distance of sixteen miles, at an estimated cost of £258,000. The matter was discussed at length, some of the opponents of the scheme arguing that the expenditure was much under-estimated. It was intimated that a statement had been made on behalf of Liverpool that no opposition would be forthcoming from that quarter provided the effluent was chemically treated, as proposed. On a vote being taken, the scheme was adopted by 49 votes to 9. Subsequently a formal objection was lodged by one of the city elective auditors, on the ground that the scheme had not been sanctioned, as required by the Borough Funds Act, 1872, by an absolute majority of the whole council. A second meeting of the City Council will therefore be held on October 6th to confirm the adoption of the scheme.

COVENTRY.—The General Works Committee of the City Council have negotiated an agreement with Mr. James Mansergh, M.Inst.C.E., for his employment as engineer for the sewage scheme. Mr. Mansergh is to prepare plans, sections, specifications, &c., and supervise the execution of the work for a commission of 5 per cent. on the actual cost, exclusive of lands and easements. He is also to take out the quantities, to prepare and print bills of quantities and specifications, and provide copies for the use of tenderers, and copies of working drawings and specifications for contractors, for a further commission of 1½ per cent. on the amount of the accepted tenders. The city engineer is to act as resident engineer, unless and until the corporation, with the approval of Mr. Mansergh, otherwise determine. In any such case the corporation are to appoint and pay a resident engineer approved by Mr. Mansergh. The corporation are also to appoint and pay such inspectors as may be required, such inspectors being either nominated or approved by Mr. Mansergh. The agreement has been confirmed by the corporation.

A public library and reading-room are about to be built for the parish of St. George the Martyr, Southwark, and towards the cost Mr. J. Passmore Edwards has promised the sum of £6,000 conditionally. Messrs. C. J. Phipps and A. Blomfield Jackson, of 26, Mecklenburg-square, W.C., are the architects.

The foundation-stone was laid last week of a Welsh Methodist chapel in Marten-place, Canton, Cardiff. The style of the building is Gothic, one of the principal features being a tower and turret at the north-west angle of the building. The materials used are Newbridge stone with Bath stone dressings, and the internal woodwork is of pitch-pine. The edifice, which will accommodate 650 people, will cost about £2,360, and the work is in the hands of Messrs. Cox and Bardo, contractors, Elm-street, Cardiff. The architects are Messrs. Haber-hon and Fawcner, of Cardiff and Newport, architects to the Tredegar estate.

Our Office Table.

THE annual report on the British Museum states that the number of visitors to the library again declined, owing, it is believed, to the growth of local libraries in the Metropolis, and there has also been a slight reduction of the total number of visitors to the several departments. No very large works have been undertaken on the fabric of the Museum; but the substitution of skylights for windows in the Egyptian and Babylonian rooms on the upper floor, commenced two years ago, is in progress, and when completed will add materially to the wall-space available for exhibition cases, and will improve the light in the several rooms. The rearrangement of the sculptures from the site of the Temple of Diana at Ephesus has been almost completed. Excavations have been carried on, with means placed at the disposal of the trustees by the bequest of Miss Emma T. Turner, at Enkomi, near Salamis, in Cyprus, on the site of a cemetery of the Mycenaean period. The antiquities discovered are both numerous and important, including a large proportion of gold ornaments. The operations of this year have exhausted the Turner bequest. The sum of £2,000, so generously bequeathed by Miss Turner, has enabled the trustees to undertake, since 1893, three successful excavations in Cyprus—viz., at Amathus, at Curium, and at Enkomi, with the result that the Museum collections have been enriched by most valuable and interesting remains. Among the more important purchases are enumerated a series of Egyptian sculptures of extreme antiquity, dating back to about 3700 B.C.; a remarkable sarcophagus of terracotta, painted with battle scenes from Glazomenae, in Ionia, of the 6th century B.C.; a MS. copy of the Gospels, called "The Gospel of St. Grimbald," written and ornamented early in the 11th century in the Monastery of Newminster at Winchester; a drawing by Michelangelo Buonarroti, one of the finest extant works of the master. No opportunity of enriching the Library by purchases on an extensive scale occurred during the year, and the additions of chief importance were early productions of the Press. The most remarkable of these is Macho's French Bible, or rather abridgement of the Scriptures, printed at Lyons about 1477; one of the rarest of old French books, says Dr. Garnett, and the first containing woodcuts, the first in which the place of imprint is specified, and preceding the first actual translation of the Bible into French by more than forty years. A proposal made by the committee of the Huxley Memorial Fund to place a statue of the late Professor Huxley, by Mr. Onslow Ford, R.A., in the Natural History Museum has been agreed to by the trustees.

THE 58th annual report of the Deputy Keeper of the Public Records, just issued, states that the number of applications for the production of records, State papers, &c., in 1896 were, in the legal search room 14,228, and in the literary research room 32,634. The work of preparing a systematic calendar of the Patent rolls is proceeding. The object of the scheme is to provide an English calendar to these invaluable documents from the reign of Edward I. to that of Henry VII. inclusive. Mr. R. P. Mahaffy, B.A., has begun a calendar which will deal with Irish papers in the Public Record Office during the reign of Charles I. and the Commonwealth, and during the earlier part of the reign of Charles II. Those of subsequent date fall within the scope of the calendar of State Papers, Domestic, and the calendar of Home Office Papers. As to buildings, the new block of the Public Record Office, facing Chancery-lane, having been completed in 1895, as stated in the last report, the House of Commons voted a sum of £20,000 for the financial year 1896-97 towards the erection of another block, which will connect it with the portion erected between 1850 and 1871. The cost of this fourth instalment of the General-Repository of Records is estimated at £50,000. The site having been cleared by the demolition of Rolls House and Rolls Chapel, the work was begun in the month of February, 1896.

TRAFFIC on Buchanan-street, Glasgow, between St. Vincent-street and West George-street, has been suspended during the earlier part of this week to allow of the laying down of a new sort of paving by way of experiment. The material is a kind of asphalt, is the patent of an American company, and is named alcatraz. Its chief con-

stituents are a quartz sand found on the coast of California, fibre, and bitumen. Although new in this country, the alcatraz paving has been in use in America for a considerable number of years, and it is alleged to stand wear admirably, and also extremes of heat and cold. The workmen engaged in laying the pavement have been brought from America, and are mostly men of colour. In putting it down they are assisted by a small and very rapid steam road-roller, and throughout the day the operations attracted large crowds. The asphalt is laid on the top of concrete to a depth of 3in. The pavement is to be upheld by the company for five years, free of cost to the Glasgow Corporation.

A CORRESPONDENT calls attention to an advertisement in the Birmingham newspapers for a surveyor of highways, inserted by the East Elloe Rural District Council, who offer the munificent salary of £62 10s. a year, to include all travelling expenses. In return for this splendid salary the "person appointed must be fully competent to perform all duties appertaining to the office, keeping accounts prescribed by the Local Government Board and the council, give a guarantee fidelity bond for £100 for the faithful discharge of the duties, and be responsible for the repairs and keeping in order everything connected with a length of 115 miles of roads, to find and keep his own horse, and devote the whole time to the duties of his office." Our correspondent asks whether the members of the East Elloe R.D.C. believe that for such a sum they can obtain the services of a "competent surveyor." Surely this is a case where the Municipal and County Engineers and Surveyors' Association might, with effect, make representations to the Local Government Board.

THE work of excavating the site of the Grey Friars Monastery within the grounds of Cardiff Castle, undertaken by the Marquis of Bute, and executed under the superintendence of Mr. C. B. Fowler, architect, of Cardiff, proceeds apace, and interesting discoveries continue to be made. Lord Bute recently gave orders for the removal of the whole of the accumulated earth, the dumpings of refuse by generations of Cardiffian scavengers, from the floor of the church of the monastery. At the depth of about 4ft. from the modern surface that floor was uncovered, and in the north aisle the stone foundation of a tomb was laid bare, with a portion of the stone plinth in situ. This tomb was found to contain the skeletons of two persons, and is believed to be the burying-place of Sir William Flemming and Llewelyn Bren, who were interred here in the middle of the 14th century. They were buried side by side, under a stone tomb, which was in existence about the year 1530. In addition to the tomb and its contents, there has been discovered the connecting passage between the church and the cloisters of the monastic buildings. Arch-stones of the nave arcade have been unearthed, while on the south side several yards of original floor have been laid bare, one of the tiles, representing the arms of England—three lions and a shield—being in situ. Several coins have been picked up, amongst them being a silver penny struck at York in the reign of Henry I. or II., a Dutch coin of much later date, and an Abbey copper token of about the time of Henry V.

THE fourth annual report on the changes in wages and hours of labour in the United Kingdom has just been published as a bulky green-book of 274 pages by the Labour Department. During the year dealt with, 1896, the net result of all the changes recorded has been, Mr. H. Llewellyn Smith, the Commissioner for Labour, reports, a rise of wages amounting in the aggregate to nearly £27,000 a week. This increase, although shared by all the important groups of trade except mining, was chiefly accounted for by a general rise in wages in the engineering and shipbuilding trades. The average weekly increase per individual affected was 10½d. The average percentage of unemployed members of trade unions making returns was only 3·4 in 1896, compared with 5·8 in 1895, 6·9 in 1894, and 7·5 in 1893. In the building trades, taken as a whole, no fewer than 88,946 workpeople received an increase of wages, averaging 2s. 0½d. per head per week, as compared with 24,431 in 1895 (when the rise was 1s. 8½d.), 32,993 in 1894 (1s. 5d. rise), and 44,538 in 1893 (rise 1s. 5½d.), showing more than a maintenance of the steady augmentation shown during the last four years. The changes in the hours of labour affected a far larger number of people than in any of the preceding years, the net result being a decrease of nearly three-

quarters of an hour weekly per individual. The numbers for 1896 were, however, unduly swollen by the inclusion of building operatives in London, whose hours of labour underwent a very slight increase in connection with the readjustment of working rules. The advance in wages in the building trades were next in importance to those in the shipbuilding and engineering trades, and of the total increase under the first head of £9,141, no less than £5,373 is due to the general advance in the London building trades that took place during the spring of 1896. As might be expected, the chief gainers by the rise in these trades were the carpenters (38,576) and bricklayers (27,075), the net weekly rise being £3,954 in the former case and £2,833 in the latter. In London the only class who did not share in the increase were the house painters. Changes, affecting over 1,000 workmen, also took place in Leeds, Manchester, Liverpool, The Potteries, Aberdeen, Edinburgh, Glasgow, and Dublin.

THE Local Government Board have just decided a question of some importance as affecting the powers and rights of the smaller town councils. The Blandford town authority gave a tradesman permission to bring out his shop window over the pavement some 15in. to 18in., to be in a line with like windows on either side. The county council, who contribute towards the maintenance of the highway, demanded that the projection should be put back, as being an encroachment on the public footway. The town council refused to comply, considering that their powers and rights in this connection had not been abrogated by alliance with the county council for the purposes of the maintenance of main roads. The latter body thereupon withheld the sum of £31, due in respect of the portion of the highway in question, until the window was displaced. The result of the dispute was an appeal to the Local Government Board, who have supported the town council and ordered the county authority to pay the sum withheld and the cost of the inquiry.

AN exhibition of art work done by the students at the South-West London Polytechnic, which is situated in the Manresa-road, Chelsea, Mr. C. L. Burns being the head master, was opened on Saturday in the gymnasium. The principle classes are for decorative designs in black and white, wood-carving, cut and embossed leatherwork, embroidery and decorative needlework, drawing, painting, and modelling, and spinning and weaving. Mr. F. R. Wilkins was awarded a bronze medal for his design for a wood panel, and Mr. W. F. Blagg takes a silver medal for his design for a cabinet. The same student has also gained a silver medal for a colour-printing design, and takes a bronze medal for decorative wall-paper. Mr. Moller has a design for a metal hand-mirror, and Mr. Townsend contributes a model of a horse. A bronze medal is awarded to Mr. F. A. Browne for a stencilled frieze with a fruit subject; and other exhibits commended are Mr. E. Pomeroy's dishes in hammered copper, Mr. Kemp Welch's pastel studies, Miss Anna Griffin's water-colour, "A Rainy Day, Chelsea," Miss G. Gaudet's water-colour studies, Mr. H. E. Compton's sunset scene at Finstral Bay, Cornwall; Miss S. Collett's miniatures, and Miss Simons's needlework. The exhibition remains open to-day and to-morrow.

EFFLORESCENCE on brickwork may, according to Professor Günther, of the University of Rostock, come either from the bricks or from the mortar. While incrustations of calcium carbonate do no harm beyond spoiling the appearance of the work, soluble alkali salts repeatedly dissolve and recrystallise in the cracks, ultimately producing disintegration. To prevent these incrustations, pyrites and sulphates can either be removed by the slow process of seasoning the clay by prolonged exposure to the weather before making up into bricks, or by adding barium salts to the clay before burning, so as to produce the insoluble barium sulphate. Another remedy is the prevention, in continuous kilns, of the oxidation of the sulphur present in the clay or coal beyond the stage of sulphurous acid, which may be effected by limiting the air supply. Finally, the bricks should be very thoroughly burnt, since in this state they are less disposed to absorb the moisture necessary for the extraction of the soluble salts.

"A WINTER RESIDENT ON THE RIVIERA" draws attention in the *Times* to the sanitary condition of most of the houses let to visitors. On arrival at his destination on the Riviera he found he was in a house of an expensive character being built in a very good situation. In the middle of it, in the

basement, was a great pit. Inquiring the object of this, he was told it was the "fosse" or cesspool for the whole house. The pipes that led into it from the closets were very large and of rough earthenware, with very imperfect joints, and they were all inside the house. A friend who had an examination made of a house he proposed to take was told it was in the best sanitary condition, so much so, indeed, that "not a drop of sewage could escape outside the house." Examining a house himself later on with a view to hiring it for the year, the "Winter Resident" found the cesspool partly outside and partly under the house, the soil-pipes coming down inside the house of the very roughest construction, and no pretence of a siphon trap. An inch or so of water in the pan was supposed to provide all necessary security against the admission of sewer-gas. The owner was indignant at being told this was all wrong; the English, he said, were mad about microbes; he had always let the house, and he would do nothing. The English doctor stated that 99 houses out of 100 were no better. He concludes by remarking that the same people who insist on excessively stringent tests before taking a house in London go gaily into such a house as he has described on the Riviera.

THE authorities of the Water Department at Chicago have been endeavouring to secure a device that will prevent the theft of water from the city main by manufacturers who, it is alleged, tamper with the meters and draw water through the by-pass around the meter. Mr. Alexander Prussing has patented an electrical device for this purpose, which will allow the dials of meters all over the city to be kept in a single room in the City Hall, where they can be watched, and where the ringing of an electric bell will give notice of any attempt to tamper with the meters of factories. Mr. Prussing claims that the cost of the control system will be small, as the council already has plenty of wires to all parts of the city and the right to use the conduits and poles of several companies. He estimates that the local wiring will be inexpensive, while the recorder costs but little, and will save much of the cost of inspection under the present methods.

The Intermediate and Technical Schools at Llanelli were opened on Tuesday. The new buildings occupy a commanding site near the hospital, on Marble Hill, overlooking the town. They have been built from the designs of Mr. W. H. D. Caple, Cardiff, by Mr. E. Groom, contractor. Accommodation is provided both for boys and girls, the total cost being £5,200. The equipment of the workshops, laboratories, laundries, &c., has entailed an additional expense of £2,000.

The refuge hut on the Zugspitze, the highest mountain in Germany (10,000ft.), near Garmisch, in the centre of the Bavarian Highlands, was opened on Sunday last. It stands on the Grat between the east and west peaks, affords accommodation for 22 guests, and is built of stone, tied together and fixed to the rock by steel bars. The interior is lined with cork and felt. The architect is Herr Wenz, of Gross-Hessenlohe, and the cost, £2,000, has been met by the Munich section of the Alpen-Verein.

Steady progress is being made with the extension from London Bridge to Moorgate-street of the City and South London Railway. At present the principal undertaking is the shoring up of Hawkesmoor's Church of St. Mary Woolnoth, Lombard-street, in order to build beneath it a City station. The south wall of the church will be entirely supported on steel girders, and the north wall partially. A new foundation is essential for the twelve stone columns, which support the arcade and roof above. The engineers for the new railway are Sir Benjamin Baker and Mr. David Hay, while Mr. James Forgie is the resident engineer. Messrs. John Mowlem and Co. are the contractors.

An inquest was held at Chadderton, near Manchester, on Monday, regarding the death of John Greenwood (30), steeplejack, Oldham. Robert Calvert, Oldham, a steeplejack, said he was engaged on Friday with a man named Bowden and deceased to put up scaffolding to remove the terracotta coping off the top of the chimney of chemical works in Haig-lane, Chadderton. While removing the terracotta a portion of the chimney slipped and fell on to the scaffold, which gave way, and Greenwood was precipitated to the ground, a distance of about ninety yards. Witness got on to the ladder, and Bowden clung to a portion of the top of the chimney which remained intact. Gavin Torrence, foreman for Mr. Ball, chimney repairer, said was common to find cracks in terracotta work at the tops of chimneys. A verdict of "Accidental death" was returned.

MEETINGS FOR THE ENSUING WEEK

SATURDAY (to-morrow).—Visit to the Grove Fever Hospital, Tooting. Train from Ludgate Hill to Tooting Junction at 2.54, or Victoria to Balham, 2.38 p.m.

THURSDAY.—King's College, Strand. Conversazione and Distribution of Prizes by Sir Henry Harben to the students of the Architectural and Building Construction Classes, the Architectural Studio, and the Wood-Carving Classes at King's College, Great Titchfield-street and Kensington. 8 p.m.

THE ARCHITECTURAL ASSOCIATION.

The CLASSES COMMENCE on the 11th OCTOBER at 6.30 p.m., and the STUDIO OPENS on the 12th OCTOBER at 6.30 p.m.
Nomination Forms, together with a pamphlet containing full particulars of the Studio, Lectures, Classes, and School of Design, may be obtained on application to the Hon. Secs., at 56, Great Marlborough-street, W.

E. HOWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

THE SURVEYORS' INSTITUTION

(INCORPORATED BY ROYAL CHARTER).

Temporary Address—
SAVOY STREET, VICTORIA EMBANKMENT, W.C.

EXAMINATIONS, 1898.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of Students will be held on the 19th and 20th of JANUARY NEXT. It is proposed to examine Candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland, and Northumberland, at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish Candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers, and Building Surveyors (held under the provisions of the Charter), qualifying for the Fellowship and Associateship of the Institution, will commence on the 21st of MARCH NEXT.

English Candidates for the Professional Examinations will be examined in London.

Irish Candidates will be examined in Dublin. Particulars as to subjects, course of examination, prizes, scholarships can be obtained of the Secretary.

All applications for the Professional Examinations, Divs. II., III., IV., and V., must be sent in before the 31st of OCTOBER, and applications for the Students' Preliminary Examination before the 30th of NOVEMBER. The necessary Entry Forms for the various Examinations can be obtained of the Secretary.

CHIPS.

The Cawood, Wistow, and Selby light railway has just been completed and opened.

The trustees of the Sydney Art Gallery are making arrangements for an exhibition of Australian pictures in the Grafton Galleries in April next. Miss Eadith Walker, of Sydney, has given £700 towards the expenses.

Alterations are being made to the stables of Messrs. Barclay, Perkins, and Co.'s Brewery, Southwark, embracing the ventilation, which will now be carried out on the Boyle system.

The urban district council of the modern railway-works town of Eastleigh, near Bishopstoke, have decided to provide themselves with a town hall and public offices at a cost not to exceed £4,500.

The West Cornwall Women's Hospital Committee have held a special meeting of subscribers at Redruth, at which Mr. J. Passmore Edwards's offer to erect a wing for children at his own expense was accepted.

The Bristol Town Council discussed for three hours on Tuesday, a resolution requesting the Docks Committee to take steps so that a Bill might be promoted in the coming session authorising the construction of new docks to accommodate the largest class of vessels, and an amendment in favour of deferring action for twelve months. The amendment was lost by 36 votes to 21, and then the resolution was carried without a division.

The new church of St. Mark, Brithdin, near Dolgelly, was consecrated last week. It is built of local gray granite, in the style of a North Italian country church. Messrs Sedding and Wilson are the architects.

The foundation-stone was laid on Friday of the Working Man's Institute and Free Library about to be erected in one of the principal streets of Canterbury, out of the bequest of £10,000 left to the city by the late Mr. J. G. Beany, M.D., of Melbourne, Australia, a native of Canterbury, to whose memory a cenotaph was placed a few years ago in the nave of the cathedral.

At the last meeting of the City Court of Common Council, Mr. Burnett brought up a report from the City Lands Committee on a reference to consider and report what steps should be taken to remove the present unsightly structure disfiguring a large part of the front of the Guildhall. It was recommended that the consideration thereof should be adjourned for twelve months. An amendment that the committee should be instructed to consider and report upon the subject at an early date was, however, carried.

The cathedral at Wakefield is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2230.

FRIDAY, OCTOBER 1, 1897.

ALL-ROUND MEN AND SPECIALISTS.

BUILDINGS are now so complex and varied that it is only by devoting himself to two or three kinds of structure that the architect can hope to meet with any success. A superficial knowledge of architecture is of value; to know what has been done in the various branches of practice, to be able to plan and advise on domestic buildings, homesteads, hospitals, schools, churches, libraries, and other works is of absolute importance to the young architect who is hoping to find his way into a lucrative practice of some sort; but we do not think that a general and varied practice is the best way to achieve success in any profession. In law and medicine we know that the man who sticks to one class of practice is he who makes a name, and in the artistic professions the same rule holds good. If we just for a moment try to remember the leading architects of the present generation, we shall find they have all followed some particular line; they have been great as church builders, as designers of residences, experts in the design of hospitals, or baths, or town halls. We can hardly think of one eminent in the profession who has been highly successful in both ecclesiastical and domestic work, or who has been an adept in the planning of hospitals as well as other kinds of buildings. And it is not difficult to seek the explanation. Each of these occupations is enough to occupy the mind for a lifetime, if it is followed in the true spirit. Look at what house-planning and design entails, to take an ordinary and perhaps one of the most common branches. The plan of a house only looks simple to the ignorant and the novice, who thinks one house can be planned like another in any situation; but the student of house-planning and design knows better. He finds it a study for every individual client and for every set of new conditions. What may do for Mr. Smith will not suit Mr. Jones. What does in the London suburb will not do in the country. But these differentia are not understood, and never will be by the average builder of estate houses, or the average tenant who occupies them. They are for the architect only to know and study them if he will. Again, the possibilities of design are as varied as the individuals. To try and make one type of house the receptacle of every kind of human beings as if there was no difference in human nature and habits, is like applying a Procrustean rule to every condition of society. And yet our great towns are really following this rule in house building for the million, because the great mass of the public want to be housed. Have our great social ameliorators ever thought of the injustice of the proceeding, the product of leasehold tenure? But the economic law of multiplying the same house or article of use, whatever it is, has stamped out every artistic instinct. The study of sanitation, of a hundred things which minister to the health and comfort and pleasure of the dweller, are quite sufficient to occupy a lifetime. In short, the architect who has made himself a master of domestic arrangements in all its varied requirements could have little time left to think of any other development of building.

How impossible it is for him to leave his house-planning and design for, say, a building like a hospital, where he would have to learn everything anew, and where the conditions of habitation are so different. Imagine such

a one turning from the study of a plan for a large residence to a ward plan—comparatively a stranger to the task. Is it practicable for him to disengage his mind so completely as to contemplate an aggregate of human beings suffering under a certain kind of malady with requirements of a special sort, in which a large medical staff, a number of trained nurses and servants, are concerned?—to apply his knowledge of domestic offices to the planning of such a complicated block as administrative buildings, laundry, boilers, and the hundred details of a large hospital establishment. No; certainly not. Those who have devoted themselves to hospital arrangement and design, simple as it is when made a special study, find it quite impossible to turn their attention to other kinds of buildings of very different character. It is a labour of years to collect the best types of hospitals; to have read the leading treatises on the subject written by medical men as well as experts; to have fathomed the perplexities of the blue books and regulations of the Local Government Board; to have gone through the pages and examples of Oppert, or have read the works of Mr. Saxon Snell, or of Sir Douglas Galton; it requires further experience of practical work to plan a hospital with attention to all that has been said on the Continent and in America. The planner of a hospital must keep pace with all that has been done; he ought to know every important building, and the points that have been approved or condemned by the medical and nursing professions, before he can hope to make any progress. Whatever a student in his earlier years may do in the study of building arrangements, it does not follow that a professional man can do the same. He gets accustomed to one class of work, and it requires a prolonged effort to throw himself into another groove. We are speaking chiefly of planning, and of the many special details which belong to a particular class of building like hospitals. There is to arrange questions of engineering, such as laundry work, the heating system to be employed, how the wards are to be heated and ventilated, all of which must be devised and specified. Then again, hospital design can scarcely be said to fit a man to undertake such a work as a large hotel or block of offices. Although one is intended to house a number of persons in disease or sickness, and the other to house a number of persons in health; the control and administration in the two cases require very different structural arrangements. Again, the hygienic conditions of a hospital require separation to be carried to an extreme; the individual is under a rigid discipline, in the other he is allowed ease and comfort and social intercourse. On the same grounds, simplicity and plainness are as essential to the first, as art and sumptuary arrangements are required in the other. The man who has occupied many months or years in planning wards and offices will find himself rather awkward in turning his hand to design more costly and ornamental buildings. In short, each kind of building needs a special training; what the mind and hand have been accustomed to grows into a habit, and the architect who turns his attention from one to a totally dissimilar kind of structure at almost a moment's notice discovers his own awkwardness. The change was good in his student days; but when practical work has to be done the labour of re-learning and adapting oneself is hard. The "all-round" man finds, despite his facility of adaptation, a difficulty in persuading his clients that the house he has designed, or the farm-buildings he has planned, are quite what they should be. If a church, or a school, or a public library falls to his lot, he does his best; it passes muster in his locality. But there is sure to be something about it which somebody finds out that is

wrong, and not critically correct. Or he is dissatisfied himself with his work after seeing other buildings designed by specialists. It is the sort of experience one buys dearly.

Nowadays architecture is no longer an abstract question of design which anyone who has an artistic faculty can pursue. It may have been so once when all the buildings ranged themselves into two great classes—ecclesiastical and domestic; but now it is mainly the science of devising plans to modern requirements, of arranging baths, hospitals, laboratories, schools for various purposes, libraries, and a host of other uses, and he who can command a large experience and knowledge of a few buildings has the advantage. It is hardly a matter of speculation that in the near future the profession will have to devote themselves more to special "lines" if they want to succeed, and the "all-round" practitioner will find it better to confine his attention more and more to the commonplace duties which lie on the circumference of his profession—surveys, valuations, quantities for buildings, and the general superintendence of small properties. At least, this is the natural drift of competition in all professions—a general "levelling-up" in special departments—and unless the younger men see this and shape their practice accordingly, they will have to be content with following a long way behind. In speaking of this specialisation of study, the questions of art and style cannot be left out. There will always be those capable of giving artistic expression to their work, whatever it may be. The specialist in plan will always find his proper level, even though he may have to call in a "ghost" to assist him. It is better, however, that he should learn to be independent of all extraneous kinds of help, and trust to his own judgment and sense of proportion to produce honest architecture, which has invariably been developed in this way. Affectation and a desire to produce "artistic" buildings has been generally the snare. He knows his strength and ability up to a certain point, and then it deserts him when he begins to think of his elevations. He employs someone to "lick his plan into shape"; it adds expense and disappointment. That "nice perspective" cost him dearly. To make the plan presentable the draughtsman undertakes to remodel the design, with infinite injury to its merits. But a man strong in plan is in no danger of wrecking his design by allowing such interference; it is rather the man with superficial ideas of plan who leaves his work to be mutilated by the draughtsman. Having rather indefinite views himself, he is not very particular as to any suggestions: his first desire is to produce a design of some merit artistically. He hands his crude sketches over to the "artist," for him to put into shape—with the result that it is so transmogrified, that he hardly knows it when he sees it.

A word may be said about style, another bugbear to the professional architect. Is it permissible to practise in more than one style? An architect naturally gets acquainted with a particular school or treatment, and it is hard for him to think of anything else. Can he do so with any conscientiousness or consistency? The old architects only had one in which they worked; but the modern is allowed to practise half-a-dozen if he choose. What we have said about plan applies with as much force to style. Directly a man tries to design in a style he is ignorant of, he fails. We have numerous instances to prove this, one of the most conspicuous being the late Sir Gilbert Scott's work in Whitehall. The proper and only real style a man can use is that which naturally comes to him, and in which he has been brought up. It is his own language or mode of expressing himself; and when he tries another language he is sure to do something that is second rate. In these days it is the custom to hand over the plans

of an expert to someone who will make them either Gothic or Classic, whichever is in the ascendency. The designs for the Houses of Parliament were in this way turned into Late Gothic by Pugin, an admirable reproduction of the style, though ill-adapted to the London atmosphere. This example has been followed in the Government Offices, and in many other buildings with even less success. If there is good in specialism in plan, specialism in style has certainly quite as much to be said for it; yet we hardly think it honest for one architect to make the plan and another to design the elevations in any style that may be selected. But to this pass has our architecture come—it is no longer one man, one style—but a dozen or more styles which he undertakes to work in. Let an architect limit his practice to a few kinds of building which he has made a study, and with it will come a style of treatment which is both true and natural.

DIVISION OF BUILDINGS.

IT is a pity those who drew up the London Building Act did not clearly state that every building used "in part for purposes of trade or manufacture and in part as a dwelling-house" should be provided with a separate entrance and staircase inclosed with walls of fire-resisting materials to the dwelling-house portion. Instead of which, the builder is left to understand that no distinct entrance is required if "the means of approach to the dwelling-house portion are constructed throughout of fire-resisting materials." But the "means" may make all the difference. As a matter of fact, the builder ought to comprehend what is intended; but it is convenient for him to take advantage of any ambiguity in the section of the Act. One of the most ordinary building operations in London is the division of a building into parts—one for business, and the other for dwelling, as, for example, making one portion, generally the largest, a sort of warehouse or shop, and the upper portion into rooms for living and sleeping. Most of the large business establishments in all parts of the Metropolis are thus divided into shops and dwellings, and it was to secure the safety of those who have to sleep in the upper stories of these premises that section 74 of the Act of 1894 was framed. The former enactment (18 and 19 Vict. c. 122, section 27) was certainly very inadequate, and the repealed section is intended to insure the separation of the two portions; but it does not appear to have done so. There is an inveterate desire to plan buildings on the old lines, to make approaches and staircases in the most temporary way to that part or division of the building which is intended for private use.

A very large and important class of buildings in London are those intended for restaurants and public bars. To obtain as much room as possible for the public, the whole ground floor is utilised, and a very small space is given up to the approaches to the upper stories, especially if these are private. We see very often merely a wooden partition or a thin wall made to shut off the bar from the private rooms or staircase. As a case in point, a recent decision by Mr. Hannay on an appeal at the Marlborough-street Police-court in connection with a rebuilding of a tavern situated at the corner of Windmill-street and Tottenham Court-road, deserves notice as typical of a large number of houses used as public bars. The ground floor was planned as a bar and was open to both streets, while the first floor was set apart for a large billiard-room, out of which rooms the staircases were contrived—a very common plan. The architect's plans showed a single staircase approached from the bar leading to the billiard-room on the first floor; it was inclosed by a 4½ in. wall, and a door with glass panels giving

access to the billiard-room. From this landing, separated from the latter room and from the staircase by a 9 in. wall, a staircase led to the upper stories, used for sleeping-rooms. The objection made by the district surveyor was that the building would exceed the statutory ten squares in area, and that the two portions were not separated by walls and floors of fire-resisting materials, but that the staircase intended would be common to both parts entered from the bar, and without any separation from either part; that the 4½ in. brick wall on the first story with the glass panelled door was not a proper wall of fire-resisting material between staircase and landing. The appellant contended that the inclosure of the staircase up to the first story, and of the landing, so as to separate the ground-floor stairs from billiard-room, was not prescribed by the section; but that it was sufficient to have a staircase from the billiard-room upwards inclosed by a brick wall and fire-resisting door.

It was argued that the builders' construction did not satisfy the section, which, though clumsily worded, required the approach to the dwelling-house portion to be entirely separated from the trade portion. As shown on the plans, the dwelling-rooms could not be entered except by coming through the bar from either street. The bar, in fact, it was argued, was the means of approach to the dwelling portion. To comply with the Act, a separate approach entirely walled off from the bar by a 9 in. wall leading from one of the streets to the staircase was necessary, and the billiard-room required to be separated from the staircase by a similar wall. It is needless to say the magistrate confirmed the district surveyor in his requirements. The fault here was in proposing to make the bar the only approach to the dwelling-house above, so that if the bar was rendered impassable by fire, the occupants on the upper floors would be cut off. They, in fact, would only be able to reach the billiard-room floor.

In buildings of this kind with two frontages, the only safe plan is to build a walled staircase and lobby accessible from one street entrance, with a fire-resisting door between it and the bar which could be closed in case of fire, and this inclosure of walls should go straight up to the dwelling-house floors with doors leading into them. The walls, of course, should be of 9 in. thickness. The bar would thus be entirely separated from the entrance lobby, also the billiard-room. Or there could be a separate communication between bar and billiard-room connecting the two, independent of the dwelling staircase, which could be used by the staff and players. The object is to economise space, however, and to make as little encroachment as possible on the bar, which generally occupies both frontages. What is worse is that these public bars are full of inflammable materials in the shape of wooden partitions glazed, counters, casks of spirits, &c.; then there is the greater risk of fire by numberless gas-burners and the intense heat, which would cause a small accident or any ignition to quickly spread. With only the wooden partitions to close off the staircase in the centre or inner side of the bar, the superstructure would stand very little chance. If the section in the Act had been more explicit; if, for example, the tavern had been mentioned as one of the buildings exposed particularly to danger, and it had been provided that not only should there be a separate entrance from the street to the dwelling-house, but that the construction of the ground story should be fire-resisting, and have a floor that was incombustible between it and the upper stories, a great deal of uncertainty might have been saved. What precautions have many of these highly-heated and lighted bars against the spread of fire? Quite as dangerous is the large drapery shop or warehouse full of gas-burners, and with cotton

and lace fabrics hung up for view near the ceiling. Are these large drapery establishments constructed in such a way as to prevent the spread of flames to the upper stories? Have they in all cases the separate wall-inclosed staircase and entrance with proper doors on each landing cut off from the shop? How many lifts which connect the upper show-rooms of large stores of inflammable goods are inclosed by walls and have iron flat doors to cut off connection in case of need? These are questions which make it imperative to administer the law. But there are still the technical enemies of statutory regulations; those who take exception to the area of a building by asserting it is under the "ten squares," or that a separate approach to each part of a building was not distinctly stated, or it may be some trivial objection under section 150, which enables the builder or owner, if dissatisfied with the objection of the district surveyor, to appeal to a petty sessional court within fourteen days.

LISKEARD CHURCH TOWER.

A CONSISTORIAL COURT, presided over by Mr. Robert M. Paul (Chancellor of the Diocese) assisted by Mr. C. E. Ponting, F.S.A., of Marlborough, as architectural assessor, was held on Sept. 23rd at Liskeard Town Hall to hear evidence in support of an unopposed petition made by the vicar and churchwardens of Liskeard Parish Church for the granting of the faculty to enable them to demolish the present tower and rebuild it. The large hall was crowded. The proceedings were followed with interest, and the emphatic declaration of an opinion that it was expedient to remove the tower and build another in its place, in preference to restoring the existing structure, was always the signal for general applause. Mr. Borlase Childs explained that in 1876 a movement was set on foot which had for its object the restoration of the parish church. Mr. R. Coad, who was engaged in the office of Sir Gilbert Scott, was employed to prepare the plans, and one of his first points of inquiry was as to what should be done with the ancient tower. He expressed the opinion that for about £200 the structure could be restored. After the roof of the church had been taken off it was found that the defects in the tower were so extensive, and its foundations so faulty, that it was hopeless to attempt to restore it. The same conclusion was arrived at by Mr. Lang, the contractor for the works, and he was directed to make the ground good, as far as he could, with a view at some later date of rebuilding a tower worthy of the parish and the church. The estimated cost of rebuilding the tower then given was £3,000. In 1890 Miss Pedlar died, and under her will gave a legacy of £1,000 to be applied to the rebuilding of the church tower provided £2,000 was subscribed independently; if within ten years the tower was not rebuilt the legacy would revert to the Truro Cathedral building fund, certain conditions being complied with. Four years later a committee was appointed at a vestry-meeting to consider what should be done in regard to the matter. An independent expert, Mr. G. H. Fellowes-Pryne, F.R.I.B.A., was called in to advise the vestry, and he prepared a report in which he stated that he had made a careful inspection of the tower, which was evidently built for a much smaller Norman church, the main lines of the old roof of which were still traceable on its eastern wall. It seemed probable that the defects of the tower showed themselves at an early date, possibly about the time the old Norman church was removed, and the present 15th-century one erected. The walls were built of rough rubble work, and its main defects were a large and serious crack on the east side; the south-west angle had a crack, indicating undue pressure; the north-east angle and the north side generally were bulging out. It was, Mr. Pryne reported, perfectly possible to repair and restore the church in a satisfactory manner, and if undertaken thoroughly, he should estimate the cost at £700 or £800, including the expense of rehangings the bells. It was evident, Mr. Childs continued, that at that time Mr. Pryne had not examined the foundations of the tower, as he remarked in his report that the work should commence with a thorough examination of them. With such restoration he thought the tower could be sufficiently

strengthened to last for several generations, and its architectural and archaeological features would be preserved. The vestry, however, came to the conclusion that restoration would not be satisfactory, as, from the character of the material, the appearance of the tower would be greatly changed. There was very little Norman work to be seen in it now, and included three windows on the north side, which were all that could be introduced into the new tower. The walls of rough rubble could not be rebuilt, and that on the south side was covered with upright slating, on which cement had been put. It was beyond question that at some time the tower was raised, as there were indications in the interior of the existence of a Norman spire, probably of wood. There was also a small window, which now looked into the body of the church, but which was formerly above the height of the roof. Having decided in favour of rebuilding, the vestry advertised for competitive plans, naming the condition that there were to be introduced as far as possible the architectural features of the present tower, consistent with the architecture of the church. Twenty-seven sets were sent in, and Mr. E. Sedding, who was intrusted with the work of selecting the best, recommended the acceptance of one to which was attached the pseudonym "Moonstone." This proved to be Mr. Sampson, of Liskeard, who was associated with Mr. Coad in the work of restoring the church 20 years ago. He had had introduced into it every stone and bit of work which, in his judgment, were capable of reproduction. On January 29 last Mr. Sedding reported upon the condition of the tower, and wrote that it was rent in various directions by numerous cracks, evidently in consequence of faulty foundations. There could be no doubt that the present structure was in a precarious condition, and should be promptly prevented from further dislocation, which would cause the fabric to collapse. Any method short of rebuilding would be but temporary, for the tower needed a foundation. Under the circumstances he would not recommend its being restored, as it would be attended with considerable danger. Mr. Childs said they applied for the faculty because they were satisfied from the expert evidence that the church could not be restored. The tower must be taken down, not with a view to its destruction, but for carrying out a scheme of conservative reconstruction. Unless it was removed it would settle the matter for itself by tumbling down. Although a poor parish, Liskeard had done much for its church, having during a lifetime raised and expended £7,000 on works of restoration. Without the £1,000 legacy it would be beyond their power to collect sufficient to build a replica of the present tower; but given the faculty they applied for, he was confident the remaining £2,000 would be forthcoming. In conclusion, he referred to a letter which appeared on the subject in the *Western Morning News* on the previous day from the Royal Institute of British Architects, and said whoever caused it to be published went very close to committing contempt of Court.

The Chancellor remarked that he agreed in the opinion that it ought not to have been published.

Mr. Childs said it was most improper. The two Plymouth papers were read by almost everyone in Cornwall, and this was an unjust attempt to influence public opinion throughout the county.

Evidence was then given in support of the foregoing statements by Mr. R. A. Courtney, who acted as joint secretary of the Tower Committee in 1877; Mr. W. T. Hancock, vestry clerk; and Mr. Thomas Lang, contractor. The last-named witness stated that when carrying out repairs to the church in 1878 he opened the foundations of the tower 4ft. below the surface, and found it was simply built of hedging, the stones being placed edgewise, and without any trace of masonry. Under Mr. Coad's instructions he filled it in with cement concrete, and several of the cracks which were apparent in the tower were concealed in a similar manner. It was now in a very much worse condition than it was twenty years ago, and was leaning against the church. In his opinion the tower could not be restored, and the only thing that could be done was to pull it down and rebuild. No amount of bracing could make the present structure secure, as there was absolutely no foundation to it. Mr. Edmund Sedding, architect, of Plymouth, reiterated the opinions he expressed in his two reports to the committee, and said what he proposed was to rebuild according to the plans adopted, using every old stone that was possible,

both for the internal and external facings, and have an entirely new internal tower bonded to the old. He had made a further careful inspection of the tower that morning, and the foundations were such as he had never seen before. The stones were laid together loosely, in herring-bone fashion, and were not capable of carrying the tower. In answer to the Chancellor, Mr. Sedding said that the only sense in which the tower could be retained was by incorporating as much of it as possible in the new tower.

This concluded the evidence, and the Chancellor asked if there was any possibility, in the event of the decision being unfavourable to the applicants, of a compromise being made; of the tower, in fact, being restored. Mr. Childs replied that they would not entertain the notion for a moment. Unless somebody outside the parish raised the money to cover the cost of restoration, he was afraid the tower would have to fall and then it would be seen upon whom the responsibility rested. The parishioners might be prepared to discuss a modification of the plans, but not of the general scheme. And it was only by rebuilding the tower that the Pedlar legacy could be obtained. The Chancellor said he would deliver a written judgment in due course.

Identical copies of the following protest were addressed (1) to the Chancellor of the Diocese of Truro, and (2) to the vicar and churchwardens of Liskeard parish church:—

"13th July, 1897.—Sir.—We are desired by the President and Council of the Royal Institute of British Architects to inform you that they, having had the proposed demolition of the tower of the parish church of Liskeard, in the county of Cornwall, brought to their notice recently, have given the matter their careful consideration. They have been supplied with much information and numerous photographs of the building by various gentlemen interested therein. The tower dates from about the end of the 12th century, and is the only remaining portion of the earlier church, which was pulled down to make way for the present church about the end of the 15th or beginning of the 16th century. In the opinion of the Council of the Royal Institute, it is badly in need of repair; but there would be no difficulty in making it perfectly sound. The expense would probably not exceed £700, and might be much less. The Council are, therefore, strongly of opinion that to pull down so ancient a building, and thereby destroy a valuable and interesting chapter of history, would be a deplorable mistake, and they protest against the threatened demolition in the most emphatic manner possible. It appears that a recently deceased lady has left in her will the sum of £1,000 for the purpose of building a new tower, and to this, as the Council understands, the further sum of £2,000 is proposed to be added by the parishioners. There can be little objection to the proposed new tower being erected in some other part of the churchyard; indeed, there is good evidence that up to the time of Henry VIII. the church had two towers. Examples of detached towers are fairly frequent, those at Chichester, Evesham, and West Walton being, perhaps, the best-known examples. The new tower might properly contain the peal of bells which, owing to the defective manner in which they are hung, have very probably helped to cause the cracks which appear in the old tower. We are desired, therefore, by the President and Council of the Royal Institute of British Architects, to say that, to pull the old tower down would be not only a great mistake, but an act of vandalism altogether without excuse."

"We have the honour to be, Sir, your most obedient servants,
"WM. EMERSON, Hon. Secretary.
"W. J. LOCKE, Secretary."

SOME SPECIAL PAINTS.

FIREPROOF PAINTS.

THE vehicles employed as binding materials to the pigments in compounding ordinary paints are very inflammable and combustible, and impart this quality more or less to the paint compound. It is only when a coat of paint has become thoroughly hardened that it may be said to be non-combustible; even then, however, such paint is not proof against fire. The only media which resist the action of fire are solutions of glue and of soap. The latter material is out of the question as a vehicle for compounding paint, since it is one which is not waterproof. Glue, however, forms a layer of an incombustible nature, which will prevent the wood it covers being ignited at any ordinary heat if not a flame; but compounds of glue and other pigments can be used in only a few cases as paints. A compound of glue and lime, however, may be used as a fireproofing paint, and since the addition of lime to any paint renders the paint compound miscible in water, an aqueous solution of glue may be made to an oil-paint in which lime has been mixed. It would be ridiculous to assert that any paint would perfectly resist the long-continued action of a fire heat; but in the following compounds will be found suitable substances to meet all cases of fireproofing woodwork, scenery, and such constructions as builders are likely to be called on to prepare.

No. 1.—Ingredients: 2 parts of finely-powdered glass, 2 parts ditto porcelain, 1lb. of any sort of stone in powder, 1lb. of calcined lime, and 3lb. of silicate of soda (called water-glass) of commercial strength. The compound is prepared by mixing together the solid ingredients by sifting several times, then moistening the mixture with a little of the water-glass, and finally intimately mixing it with the remainder of the silicate, when the compound will become of a syrupy consistence, that may be used alone as it is, or with mineral colouring matter to form a coloured paint. The lime constituent imparts a certain amount of unctuousity to the mass, which allows it to be used as a washable distemper. The solid ingredients may be varied. Keep, however, the ultimate quantity of them the same, and the amount of water-glass must remain constantly the same to the above amount of solids; all parts by weight. Apply the mixture with a brush, like ordinary paint, and after the first coat has been laid on six hours give a second application. It is suitable for fancy woodwork, stone, metal, &c.

No. 2.—Ingredients: Equal parts of freshly-slaked lime, hydraulic lime, sand or slate pulverised (or any other silicious or argillaceous matter), mix altogether, and use as a vehicle sufficient cow's milk to give the whole when thoroughly mixed the proper consistency for laying and spreading with an ordinary paint brush. Glue solution, not too weak, may be added, as also any colouring pigment. The above proportions of each ingredient may be altered at will.

No. 3.—Ingredients: common rosin, turpentine, zinc oxide, zinc carbonate, and boiled oil. Preparation: Pound up the rosin, and dissolve it in sufficient turps to make a compound of the consistency of cream; mix 4 parts of zinc oxide with 1 of zinc carbonate, and stir the white mass into the rosin solution until a stiff paste is made, and, for use, thin the mass with boiled oil and turps to enable the compound to be of a working consistency. This may be coloured with stainers' colours.

No. 4.—Ingredients: Lime, glue, water, linseed-oil, colouring matter. Preparation: Put 1lb. of caustic lime into sufficient water to make a thick milk of lime, and boil this with 2oz. of glue that has been soaked (weighed dry) overnight in water, but not sufficiently soft to lose its form. When the glue has dissolved, add sufficient linseed-oil to make a soap with the lime, and to the compound thus prepared add whatever stainers' colour is desired. This paint will bear varnishing, or can be protected by rubbing with linseed-oil and turpentine.

No. 5.—3 parts finely-ground silica, 3 parts marble and sandstone (ground), 2 parts calcined white china clay, 2 parts slaked lime; mineral colouring matter as desired. Mix all the solids in dry powder, and when compounded with the slaked lime, add the colouring bodies. After several applications of this compound, the painted surface will become as hard as stone. This paint is both fire and waterproof.

SILICATE PAINTS.

Wood and plaster may be very conveniently painted with paints in which water-glass (silicate of potash or of soda) is the vehicle used to combine the pigments. It is only certain mineral colouring matters that can be used with water-glass, as certain pigments exert a chemical reaction on the silicate, and are decomposed or destroyed by the alkali in it. The following colours and pigments, however, are not altered by mixture with water-glass, and can, therefore, be used as paint therewith:—Chalk (lime carbonate), baryta white (i.e., native heavy spar or precipitated sulphate of barium), zinc white (oxide of zinc), cadmium yellow (sulphide of cadmium), Naples yellow, permanent lemon yellow (chromate of barium), chrome red, red ultramarine, blue ultramarine, cobalt blue, cobalt green, chrome green (of chromium), ivory black. Red and yellow ochres, Venetian red, smalts, umbers, and sienna earths may all be used. Dilute the silicate with water, and then mix in the colouring matter, and make up a suitable consistency to work well with the brush. If a silicate paint is to be applied to a wall, it should first be prepared with a mortar composed of pure fat lime and clean sharp sand, and the water used should be free from saline matter. When the surface of this plaster is dry, give repeated applications of a weak solution of water-glass before laying on the paint. Water-glass paint, on prolonged exposure to the air, gradually

decomposes, being washed away by the action of the mineral and carbonaceous matters carried down in the rain. Paints constituted with chloride of zinc as a vehicle are deadly poisonous should the material to which they are applied be subjected to heat, as the chloride will volatilise and the vapours give off poisonous fumes which are noxious to inhale.

WATERPROOF PAINT.

This at first sight may seem a misnomer, as it is generally considered that all oil paints are waterproof. Such, however, is not the case. Every painter knows that a coat of paint that is laid on in damp weather will take a very long time before it dries; this non-drying is caused by the moist air preventing sufficient dry oxygen reaching the oil to cause it to harden. Now, unless the exterior of the coat of paint dries rapidly after its application, the paint will never be perfectly waterproof, because it will be perforated with minute holes that allow moisture to penetrate through the coat of paint, and thereby cause a lot of trouble. The only paints that form a waterproof coating when laid on under general conditions are those compounds in which varnish is a vehicle. The following few compounds, however, are waterproof compounds—that is, will not be permeated by water even though the article painted with them be steeped in water.

No. 1.—Ingredients: 16 parts of a concentrated solution of potash; 8 parts of grape-sugar; 32 parts of solution of sulphate of copper; 6½ parts of carbolic acid solution 75 per cent. strength; 8½ parts of raw linseed-oil. (All parts by weight.) Method of preparation: Mix the potash solution, grape-sugar, and copper sulphate solution, and heat the mixture; a precipitate of hydrated oxide of copper is formed. Filter the precipitate, carefully dry it, and then mix it with the carbolic acid, heat the mixture, and then add the oil. To reduce to a workable consistence, add linseed-oil. This paint is admirably adapted for use on all structures that are in contact with sea-water.

No. 2.—Ingredients: 9 parts of shellac, 4 parts of rosin, 3 parts of Burgundy pitch, 2 parts of galipot, 4 parts of arseniate of copper, 3 parts of arseniate of mercury, 9 parts of chromate of mercury, 6 parts of mineral colouring substances, 60 parts (by weight) of methylated spirits. Heat the compound until homogeneous.

No. 3.—Ingredients: 3 parts of Venice turpentine, 1 part of mastic resin, turpentine q.s., 96 parts of linseed-oil varnish, 20 parts of strongly burned clay, 80 parts of best Portland cement, 10 parts of zinc white, 5 parts of red lead, 25 parts of oil of turpentine. Method of preparation: Dissolve the Venice turpentine and mastic in sufficient turpentine to produce a fluid as thick as milk by gently heating the mixture, and to this solution mix in the linseed-oil varnish, and heat the whole over a sand or water bath, until the turpentine odour disappears, and with 115 parts of this compound mix all the other solid ingredients, and finally, thin the whole with the 25 parts of turpentine.

No. 3.—Ingredients: 2 parts of white lead ground in oil, 1 part of red lead (dry), 14 parts of raw linseed-oil, manganese linoleate q.s., yellow ochre, kaolin, &c. Preparation: Heat the lead pigments and oil together, and while hot stir in sufficient yellow ochre, china clay (kaolin), common clay, silica, barytes, gypsum, or any other inert solid body to form a stiff dough, and while this compound is still hot reduce it to the desired consistency by adding a sufficient quantity of linseed-oil varnish and manganese linoleate.

No. 4.—Ingredients: 1 part of dry white lead (lead carbonate only), 1 part of litharge, 14 parts of linseed-oil (fluid measure), 4 parts of clay that has been baked and powdered, 16 parts Portland cement, 1 part zinc white, 1 part red lead, turpentine q.s., mastic varnish q.s., mineral colouring matters q.s. Method of preparation: Mix the lead carbonate, litharge, and linseed-oil, and heat the mixture until of the consistency of thick glue, and for every 36 parts of the mixture add 3 parts (by weight) of turpentine and 1 part (by weight) of mastic resin (mastic resin dissolved in turpentine). Reheat the whole, and for every 32 parts (by weight) stir in and mix the clay, cement, zinc white, and red lead, and dilute with turpentine (not more than 25 per cent. of the whole) or linseed-oil varnish, and then add the colouring matters to form a suitable paint.

No. 5 (cheap compounds).—Ingredients: 12½ parts colophony (yellow rosin), 4 parts mineral green, 6½ parts oxide of zinc, 1 part (by weight)

boiled oil, 5 parts (fluid measure) mineral naphtha, 7½ parts (fluid measure) petroleum spirit.

No. 6.—50 parts colophony, 30 parts light ochre, 10 parts zinc oxide, 1 part Turkey red paint, 3 parts petroleum spirit, 2 parts mineral naphtha. Preparation: Dissolve the colophony in the naphtha, and then mix in the other ingredients.

No. 7 (suited for marine structures).—(a) 60 parts methylated spirit, 21 parts shellac, 4 parts rosin varnish. (b) 7½ parts common rosin, 5 parts Burgundy pitch, 3 parts tallow. (c) 10 parts boiled linseed-oil, 3 parts tar spirit, 60 parts Turkey red, 10 parts arsenic, 1½ part zinc white, 1½ part red oxide of mercury. Method of preparation: Dissolve the shellac and rosin varnish in the methylated spirit (a), separately compound b by mixing all together by heating, also separately mix together the boiled linseed oil and tar spirit, and finally mix a b and c together, and then add the colouring bodies either separately or mixed together in the dry state by sifting; well pound up the mass.

No. 8.—Ingredients: 18 parts of amber resin powdered, 7 parts Venice turpentine, 3 parts colza (rape) oil, 8 parts mineral green, 13 parts zinc-white paint, 8 parts mineral naphtha. Preparation: Incorporate the first three ingredients by first melting the resin and then adding the Venice turpentine and oil to the heated resin. Separately mix the green and white paints with the mineral naphtha; separately dissolve the amber resin compound in half-gallon of turpentine, and dilute this mixture with one gallon of mineral naphtha, and then finally mix in the mineral-green compound, and well incorporate the whole. The quantities of fluids are reckoned in gallons, supposing the parts taken to be in pounds. The mineral-green should be first ground up with equal parts of refined oil, mineral turpentine, and turpentine varnish, and 8 parts of this compound taken to mix with the zinc-white paint.

PAINTS FOR MISCELLANEOUS PURPOSES FOR USE ON METALS.

To cause paint to adhere to metals, slightly acidulate their surface with a solution of sulphate of copper, to which a little nitric acid has been added. After an hour or so, wash the metallic surface with water, allow it to dry, and then proceed to lay on the paint.

No. 7. Black.—Ingredients: 16 parts of amber resin, 10 parts (fluid) boiled linseed-oil, 3 parts asphaltum, 3 parts rosin, 20 parts turpentine. Mix the first four ingredients by heating them together in a suitable vessel. Allow the compound to cool, and then mix with the turpentine.

BRONZE-COLOURED PAINT FOR IRON AND BRASS.

32 parts chrome green, 1 part ivory black, 1 part chrome yellow, 5 parts good japan, linseed-oil q.s. Grind all the ingredients but the last together, and then thin the compound with sufficient oil.

COPPER-COLOURED PAINT FOR METAL.

Dissolve sulphate of copper (bluestone or blue vitriol, as it is called by druggists) in water, and then add some scrap iron to the solution. Collect the deposit of copper which collects on the iron, wash it in water, and then, after drying it, grind up in linseed-oil varnish or japan.

FLEXIBLE PAINT FOR IRON.

Dissolve indiarubber or guttapercha by heating in linseed-oil or turpentine until a pasty mass is obtained, and grind up this mass, with or without the addition of more linseed-oil, with graphite or plumbago. If bisulphide of carbon or any other volatile fluid be used as the solvent for the rubber, heat the pasty mass in linseed-oil until the oil is evaporated out of the mass before mixing in the graphite; the presence of the oil is necessary, because otherwise you would be simply mixing finely comminuted particles of rubber with the graphite, as carbon bisulphide has no binding qualities, but is entirely evaporated on exposure to the air.

PAINT FOR STEAMPIPES, METAL CHIMNEY STACKS, ETC.

Dissolve asphaltum in turpentine at a gentle heat, and allow the mixture to become cold before laying it on with a brush.

Linseed-oil paint, in which plumbago is ground up, also answers well for the same purpose.

WHITE PAINT FOR METALS.

Grind up zinc-white with waterglass of 40° to 50° Bé., to the consistency of ordinary paint.

Another white paint suitable for all purposes, to which whitewash can be applied is prepared thus: Mix zinc-white with ordinary milk of lime to the consistency of paint, and lay on a coat of this preparation; when dry, brush over with a solution of chloride of zinc, which will combine with the zinc oxide, and produce an enamel-like surface.

RED PAINT FOR METALLIC ROOFS.

Ingredients: 30 parts of linseed-oil, 10 parts of oil of turpentine, 14 parts of red oxide of iron (colcothar), 46 parts of red ochre or chalk. Mix the fluids separately, and also the red powders, and then pound up all together, and if too thick reduce it with equal parts of oil of turpentine and linseed-oil. Give two coats, allowing one to dry before laying on the next. Remove all rust from the metal before painting it with the compound.

Another useful compound for painting metal is to grind up finely-pulverised rolling-mill and hammer scale with an oil varnish, and lay this on as a paint.

A HEAT- AND WATER-PROOF COATING FOR METAL ROOFS

is prepared as follows: Mix 35 parts of argillaceous schist, 30 parts of mica schist, 35 parts of rosin, coal tar q.s. Mix all the first three ingredients together in fine powder, and then mix the compound with half its volume of coal tar, and boil the whole to a fluid mass. The compound thus prepared is very pliable and durable.

PAINTS FOR WOOD AND STONE.

No. 1.—Waterproof: ½ lb. rosin, 6 gallons of fish-oil, 1 lb. melted sulphur, ochre or other colouring matter q.s., rubbed up in linseed-oil. Dissolve the rosin in the oil and heat, then add the fluid sulphur to the hot oil, and finally stir in the colouring matter, and mix well; give several coats while hot.

No. 2.—80 parts of raw linseed-oil, 17 parts rosin, 12 parts litharge. Boil the whole until the rosin is deep brown, and lay several coats of this compound on a dry, hot day, choosing a day when the sun shines so as to insure that the wall is not damp.

No. 3.—Grind lampblack in linseed-oil which has been strongly heated with plenty of litharge.

No. 4.—To brighten up red tiles and bricks, soak 1 lb. of glue for 12 hours, and then dissolve it in 1 gallon of water by boiling it, and, while boiling, stir in 2 lb. of red ochre, and mix the whole. Lay one coat of this mixture on the tiles, and, when dry, give a second application. With the addition of drying linseed-oil, and, lastly, a third coating mixed up with size. Allow this to dry, and then rub it with wax.

No. 5.—Dissolve paraffin wax in heavy coal-tar oil, and lay this on the walls, choosing a warm, dry day. To dissolve the wax, use 1 pint to 3 of coal-tar oil, and dissolve by a moderate heat, being careful to choose sufficient oil to prevent the mixture congealing on cooling.

No. 6.—Rub up 2 parts of white lead and 1 part of verdigris in a mixture of linseed-oil varnish mixed with an equal quantity of turpentine, and dilute with ordinary drying oil.

No. 7.—Ingredients: Good glue, caustic lime, raw linseed-oil, colouring matter which is not affected by lime. Soak glue in water for 12 hours, and then dissolve it with constant stirring in a thick cream of milk of lime (made by slaking fresh caustic lime) by boiling the mixture, and to this compound apply linseed oil until it ceases to mix. If too much oil be used, add a little more milk of lime, then stir in the colouring. This compound may be mixed with oil or water, and for woodwork it should be mixed with one-fourth its volume of a solution of shellac, made by boiling 2 parts of shellac in water with 1 part of borax. This compound, when dry, will take a coat of varnish.

No. 8.—Slaked lime, bichromate of potash, sulphate of lead (or else sugar of lead or nitrate of lead solution). Preparation: Slake freshly-burned lime to a powder by sprinkling water upon it, and passing the powder through a sieve, and to every 100 parts of the powder add sufficient water to form a thin milk of lime, and boil the whole in a copper vessel, and while boiling add 1 part of bichromate of potash; separately make a thin paste of sulphate of lead and water, and stir this in the boiling mixture; add cold water to the compound, and pass the whole through a fine wire sieve; drain it off through linen or cloth bags, and press the residue remain-

ing in the bags, and dry the solid residue in the air.

No. 9.—Ingredients: 3lb. burnt lime; 13lb. skimmed milk, 8½oz. white Burgundy pitch, 24oz. (by weight) linseed-oil, 13lb. Spanish white (i.e., chalk). Preparation: Slake the lime with the necessary quantity of water, and then add the milk separately; dissolve the pitch in the linseed-oil, and mix this with the lime compound, and well mix in the Spanish white.

No. 10.—4 parts of curdled milk, 12 parts of water, 1 part unslaked lime, 3 parts water, 4 to 5 parts of linseed-oil, colouring pigments q.s. Method of preparation: Boil the curdled milk in the water for a quarter of an hour, and strain the mass through a colander, washing it clean with cold water to free it from the sour whey, and press out the curd in a cloth; then, to every four parts of this curd add the unslaked lime to three parts of water, and rub up to a slimy mass. This compound is miscible in oil or in water to form an oil or a water-colour paint. The linseed oil is added to all compounds where it is to be used on wood. Yellow ochre, chrome yellow, Berlin blue, indigo, and lead and zinc colours are the best to use as colouring matters.

No. 11.—(For plastered surfaces). Ingredients: 3lb. pure raw linseed-oil; ½lb. litharge finely powdered, hard curd soap q.s., sulphate of copper q.s., sulphate of iron q.s., white wax. Method of preparation. Boil the linseed oil and litharge together until a thick mass results; strain them through a coarse cloth, and allow it to stand until clear. Separately dissolve a hard soap made from soda (not from potash) in linseed-oil q.s., and to this oily solution of soap add 4 parts of a strong solution of sulphate of copper and 1 part of a strong solution of sulphate of iron. On the addition of these solutions to the soapy compound, a peculiar metallic precipitate results. Collect this precipitate, wash it in water, strain, and dry until of a powdery condition. Mix 12oz. of this powder with 5oz. of white wax by the aid of a sand or water bath, and then compound this metallic mixture with the thick linseed oil in the proportion of 5 parts of the oil to 4 parts of the metallic compound. Well evaporate the whole by heat, and then lay it on the plaster surface with a brush, having first heated the surface of the plaster to 200° Fahr. Lay the compound on as smoothly as possible, and at the end of a few days, when all smell of soap has disappeared, rub the surface over with a piece of linen to bring up a polish. Plaster so treated is waterproof, and may be painted on or varnished.

A COMPOUND FOR FILLING UP ROUGH WORK.

Grind together 4oz. barytes, 4oz. Paris white, 8oz. vegetable black, 80fl.oz. boiled oil, 80fl.oz. gold size.

BRUNSWICK BLACK.

7lb. of asphaltum or mineral pitch, 2lb. red lead, 3 pints of linseed-oil, 13 quarts of turpentine. Boil the red lead and oil together, melt the asphaltum, and then mix the two, and when cool enough, then work the turpentine.

PATENT KNOTTING.

12 parts (by weight) of shellac, 3 parts (by weight) of amber resin (powdered), 2 parts (fluid measure) methylated spirit. A cheaper compound is prepared by omitting the amber-dust.

FLEXIBLE PAINT FOR TEXTILES (CANVAS, ETC.)

Dissolve 1 part of yellow soap in 6 parts of boiling water, and mix this (grinding the solution while hot) with 14 parts of any good oil-paint.

A second flexible paint which is waterproof, and can be used mixed with water, oil, or varnish, is this:—Boil Brazil wood and linseed-meal in water until the colouring matter is extracted from the wood, and the fluid is of a thick consistency. Strain it, and then mix this solution with a solution of guttapercha which has been dissolved in hot linseed-oil, and mix this compound with suitable colouring matter.

PAINT FOR STIPPLING WINDOW-PANES.

Mix white-lead in boiled oil or varnish, and add a little driers. Paint this over the glass thinly, and stipple it by dabbing it all over with a pad of cotton-rag made into a ball.

CHEAP PAINT COMPOUND FOR OUTDOOR WOODWORK.

Ingredients: (a) 3 parts of rosin, 20 parts fish-oil, (b) 10 parts rye flour, 20 parts water. (c) 4 parts sulphate of zinc, 9 parts boiling water;

colouring matter q.s. Preparation: Dissolve the rosin with the oil, make the flour into a paste with the 20 parts of water, and dissolve the zinc sulphate in the nine parts of boiling water, and then compound the three mixtures by stirring the flour paste into the solution of zinc, and the oil and rosin mixture into this compound. Finally work in the colouring matter.

TO COAT ZINC WITH PAINT.

Brush the zinc over with a solution made by dissolving 1 part of chloride of copper, 1 part nitrate of copper, 1 part sal ammoniac in 64 parts water, and adding 1 part commercial hydrochloric acid. This will leave a black surface on the zinc, which should not be disturbed for 24 hours, and then the oil paint should be laid on, when it will firmly adhere.

PAINT FOR METALS IN SEA-WATER.

Ingredients: 7 parts of red lead, 30 parts red oxide of mercury, 35 parts Venice turpentine, boiled oil q.s., red oxide of iron paint. Preparation: Rub up the mercuric oxide with the turpentine until well amalgamated, and then work the red lead by means of sufficient boiled oil to produce a compound of a workable consistence; the red oxide of iron paint is first applied to the iron, and then the above compound laid over it.

DRIERS FOR PAINT.

No. 1.—Two parts of white lead, 1 part sulphuric acid, 1 part sugar of lead, boiled linseed-oil q.s., all parts by weight. Mix all together and rub up to a paste with a sufficiency of oil. The compound may be used as a drier to any paint except white lead and delicate colours in which white lead is a component—white lead becomes buff or greyish in contact with this mixture.

No. 2.—(a) 15 parts of sulphate of zinc (coloured), 4 parts sugar of lead, 7 parts litharge and boiled oil. (b) 100 parts of Paris white (chalk or terra alba), 50 parts of white lead, and boiled oil. Preparation: Grind up all the components in (a) by passing it three or four times through a colour mill, and separately grind up the Paris white, white lead, and boil, and finally mix the two compounds, and pass them several times through the mill. Use an ounce or two per pound of paint.

No. 3 (for causing zinc white to dry).—6½ parts of anhydrous sulphate of manganese, 6½ parts of anhydrous acetate of protoxide of manganese, 6½ parts of anhydrous sulphate of zinc, 980 parts of zinc white. Mix all together, and use 2 to 3 per cent. with the zinc white paint.

DRYING OIL.

Boil together for a couple of hours at a moderate heat 1 part of litharge, 1 part of calcined ceruse, 1 part of umber, 1 part of talc, 120 parts (fluid measure) linseed-oil. Stir the mixture the whole time of boiling it, removing all scum as it rises, and then allow it to stand to clarify. 5oz. per pound of colour is sufficient to render it a quickly drying paint.

H. C. S.

THE CHIPPENDALE PERIOD IN ENGLISH FURNITURE.*

THE author of this manual, published by Messrs. Debenham and Freebody, of Wigmore-street, has done a useful work in describing the characteristics of the Chippendale period of English furniture. A large number of persons, including those who deal in furniture, have but very slight acquaintance with the styles of furniture, and it is to this class of the public chiefly that the author's work will be found of value. Old furniture, like old pictures, suffer under the ban of imitation, and few people are quite sure when they purchase so-called "old" furniture that they have got a genuine work of the particular period. To such people an expert opinion is of much value. The author's Introduction contains a few useful considerations on the subject of originality. As we are told, "where admissible influence ends and copying begins is a difficult problem"; but one thing is certain, the point is a variable one. "One man may steal a horse out of a field, while another may not look over the hedge." Newness, in the hands of some men, we are truly told, is only eccentricity. Very seldom are eccentricity and

originality combined. The materials employed in furniture are important factors in the earlier periods. Oak, for instance, suggested a massive treatment which we find in the 16th-century work; but in time the demand for greater refinement and lightness led to the use of mahogany, and the Chippendale period showed this refinement in the curves and delicate carving, which became more pronounced in the works of Hepplewhite and Sheraton. No doubt the revival of Classicism influenced furniture, and we have one or two illustrations of mantelpieces by James Gibbs (1728), and one at Wilton House by Inigo Jones and Kent (1744). Then followed the Adam Brothers, Chambers, and others, who made interior decoration their chief pursuit. The Gothic school of the Revival of the 18th century, fostered by Horace Walpole and Wyatt, was partially supplanted by the Greek, French, and other tastes. The following chapter of the book treats on Sir William Chambers's designs, which comprise illustrations of a Chinese room, a Chinese table, seat, Italian mantelpiece, chair, &c., and other vagaries, in which we discover the influence of his travels. Italian sculptors and decorators, like Cipriani, whom he brought over, were largely employed in England. "Thomas Chippendale" is the heading of the next chapter. Chippendale, no doubt, has been overrated; but with all his faults, he stands at the head of a period from the middle to the end of the 18th century. The examples given are not typical always, and the author's illustrations, taken from original books or from specimens which have been exhibited by Messrs. Debenham and Freebody, lack vigour in execution in some instances. We lately noticed a careful reproduction of Chippendale's great folio of copperplate designs, published by Mr. Batsford. The author gives several typical examples of chairs, as in Figs. 16, 18, 19, a Gothic table and chair from Lacock Abbey, showing Chippendale's eclectic taste. Though feeble, these designs have a certain elegance about them which shows his taste and skill in adaptation. A Gothic hall-chair and designs for chairs in Chinese are interesting; the latter show the lattice-work backs and legs and pierced frets in the square legs. A very elegant French chair (Fig. 24) and a settee made for the Bury family with a succession of scroll or strap-work uprights, are worth notice; sofas, bedposts, screens, chimney-pieces, side-board, hanging china shelves, girandoles, pier-glass frames, a commode clothes-press, &c., are a few of the designs given. Some of these are rather florid and redundant with Louis Quinze devices, broken scrolls and shells, Chinese pagodas, figures, and birds, as in the pier-glass shown in Fig. 47, and in the Rococo ornament wardrobe, page 46. His Gothic bookcase, Fig. 36, is puerile. His designs often show a wildness and eccentricity in the ornament despite the elegance of the forms and contour. He knew where to put his ornament, and never lost sight of the proportion and outline. Chippendale's contemporaries, such as Manwaring, Ince, Mayhew, Copeland, Lock, are also described. The work of these men is often mistaken for that of Chippendale. Many of the designs given show how closely they followed the master, in elegance of outline, as in many of Lock's designs, chimney-pieces, mirror-frames, which are exceedingly delicate. The Brothers Adam are well illustrated with some very beautiful and chaste designs. Hepplewhite and Shearer were fellow workers, and produced some excellent furniture; but Shearer was less educated, and his designs are rather heavy. Thomas Sheraton is better known; his designs show cleverness, sometimes to excess; but they are designed with a regard to utility. As a guide to assist in distinguishing the work of these leaders of the craft, the author's work will be found acceptable.

THE ARCHITECTURAL ASSOCIATION.

THE Architectural Association will hold its annual general meeting on Friday, Oct. 8, at No. 9, Conduit-street, W., at 7.30 p.m., when Mr. Hampden W. Pratt, F.R.I.B.A., will deliver his presidential address, and distribute the prizes, medals, and certificates. The drawings submitted in competition for the various prizes offered by the Association will be exhibited; also students' drawings executed in the Studio and School of Design during the past session. The classes which are held at 56, Great Marlborough-street, commence on October 11, and the Studio reopens on October 12 at 6.30 p.m.

* The Chippendale Period in English Furniture. By K. WARREN CLOUSTON. With illustrations by the Author. London: Debenham and Freebody, and Edward Arnold, Strand.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—IV.

By AN ASSOC. INST. ELECT. ENGS.

ELECTRIC CIRCUITS.—We are now in a position to consider the various methods of arranging conductors in practice, and to show how to calculate the resistances of the various combinations of conductors and the distribution of currents and potentials in such combinations. These calculations are important, and may be looked upon as the fundamental methods to be applied when dealing with the more difficult problems of distribution. As is well known, the complete path traversed by a current of electricity is termed an electric circuit, and it is obvious that a circuit must at least be composed of two parts: (1) the source or generator of electricity, and (2) the line or conductor connecting the terminals if the source. The former is known as the *internal circuit*, and the latter as the *external circuit*. In the external circuit, we usually have some receiving mechanism, transforming device, measuring instruments, &c.; and the general methods of arranging the separate portions (or elements, as they may be termed) composing a circuit are (a) the *series arrangement*, (b) the *parallel arrangement*, and (3) various combinations of the series and parallel arrangements.

"In series" is defined as that arrangement in which the positive terminals of an element are connected to the negative of the next, and so on, so that the whole thus connected forms a series of parts, through which the same current passes in succession, as shown in Fig. 1a.

"In parallel" is defined as that arrangement in which all similar ends, terminals, or poles of the elements are connected to one conductor, and the other ends of the elements are connected to another conductor, so that the circuit is composed of several separate paths through which electricity may pass simultaneously, as shown in Fig. 1b.

FIG. 1.

Fig. 1 illustrates these arrangements, and shows diagrammatically circuits containing a resistance, lamps, and a measuring instrument. When the arrangement does not permit of electricity passing—as when the circuit is broken, for instance—the elements are said to be on *open circuit*.

Series Circuits.—Let $r_1, r_2, r_3, \dots, r_n$ denote the several resistances of the individual portions or elements of a series circuit, and since the total resistances of such an arrangement must be the sum of the separate resistances—

$$R = r_1 + r_2 + r_3 + \dots + r_n$$

where R = total resistance. If there are n equal wires, or n parts having the same resistance connected in series, then $R = nr$. It is also obvious that the current will be the same at all points, and the arrangement forms a constant-current circuit. Now, by Ohm's law—

$$C = \frac{E}{R} = \frac{E}{r_1 + r_2 + r_3 + \dots + r_n}$$

$$\therefore E = C(r_1 + r_2 + r_3 + \dots + r_n) = Cr_1 + Cr_2 + Cr_3 + \dots + Cr_n \dots (13)$$

and the total E.M.F. of the circuit is equal to the sum of the individual P.D.'s required by the separate portions, since the product of the current and a resistance gives the electrical pressure required to send the current through the resistance. If we, therefore, denote the P.D.'s required by the separate portions by—

$$e_1, e_2, e_3, \dots, e_n$$

$$\text{Then—} Cr_1 = e_1, Cr_2 = e_2, Cr_3 = e_3,$$

and so on, and—

$$C = \frac{E}{R} = \frac{e_1}{r_1} = \frac{e_2}{r_2} = \frac{e_3}{r_3} = \frac{e_1 + e_2 + e_3}{r_1 + r_2 + r_3} \dots (14)$$

This is an algebraic statement of the fact that the electro-motive force distributes itself throughout a simple circuit uniformly, whilst in a series circuit the electro-motive force distributes itself proportionately to the resistance. From the

equation several useful relationships may readily be deduced. Thus, since—

$$R = \frac{E}{C} \therefore \frac{E}{C} = \frac{r_1}{C} \dots (15)$$

—that is, the P.D. between any two points in a circuit is the same proportion of the E.M.F. of the circuit as the resistance between the points is of the total resistance of the circuit. Again—

$$\frac{e_1}{r_1} = \frac{e_2}{r_2} \therefore \frac{e_1}{e_2} = \frac{r_1}{r_2} \dots (16)$$

These and several applications of these relationships will be referred to in the exercises given below, and in passing we may note that the general method of arranging lamps in practice is by the series method, as shown in Fig. 1a.

Parallel or Divided Circuits.—A more common method in connection with the use of incandescent lamps is to arrange two or more conductors so

FIG. 2.

that their ends are connected immediately to the same two points, as at A and B in Fig. 2, in which three wires, having resistances of r_1, r_2, r_3 ohms respectively are connected to the two points A and B. In such cases it is evident that we have between the two points a *divided circuit*, and that the current will have the choice of three paths between the two points, with the result that the current will divide according to the power of the three branches to conduct electricity—i.e., according to the conductances of the wires. This arrangement is the same as that shown in Fig. 1b, and is an example of a parallel circuit. Sometimes this arrangement is spoken as the *multiple-are arrangement*.

With the addition of separate paths forming a parallel or divided circuit, it is obvious that an increased area of conducting material is offered to the current—that is, the conductance between A and B increases with the number of branches, and the joint resistance of the wires diminishes. If we denote the separate conductances by k_1, k_2 , and k_3 , and the total conductance by K , then $K = k_1 + k_2 + k_3$; but conductance is the reciprocal of resistance.

$$\therefore \frac{1}{K} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3}$$

—where R is the equivalent combined or joint resistance of the wires between the points A and B.

$$\therefore R = \frac{1}{\frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3}} = \frac{r_1 r_2 r_3}{r_1 r_2 + r_1 r_3 + r_2 r_3} \dots (17)$$

With only two branches, supposing the branch of resistance r_3 to be removed—

$$\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} \text{ and } R = \frac{1}{\frac{1}{r_1} + \frac{1}{r_2}} = \frac{r_1 r_2}{r_1 + r_2} \dots (18)$$

If $r_1 = r_2 = r_3$, then $R = \frac{r}{3}$, and generally for

parallel circuits $R = \frac{r}{n}$, if r is the resistance of each branch, and n is the number of branches. To take a numerical example, let us find the joint resistance of three wires of 200, 500, and 1,000 ohms resistance respectively, when connected in parallel (see Fig. 2). In this case—

$$k_1 = \frac{1}{200}, k_2 = \frac{1}{500}, \text{ and } k_3 = \frac{1}{1,000},$$

$$\text{and—} \frac{1}{R} = \frac{1}{200} + \frac{1}{500} + \frac{1}{1,000} = 0.005 + 0.002 + 0.001 = 0.008 \text{ mho.}$$

$$\therefore R = \frac{1}{0.008} = 125 \text{ ohms.}$$

In this example it is obviously an advantage to express the separate conductances as decimals; in other cases it may be more convenient to make use of the expressions given in equations 17 and 18. A moment's consideration will suffice to show that when the branches are of unequal resistances, as in the numerical example above,

the current divides through the branches unequally, and we shall now explain the relationship between the currents in the branches.

Let e denote the difference of potential between the points A and B (Fig. 2); then, if e_1, e_2 , and e_3 denote the individual currents, we have, by Ohm's law—

$$e = e_1 r_1 = e_2 r_2 = e_3 r_3 \dots (19)$$

But this may be written—

$$e = \frac{e_1}{r_1} = \frac{e_2}{r_2} = \frac{e_3}{r_3} \text{ or } \frac{e_1}{k_1} = \frac{e_2}{k_2} = \frac{e_3}{k_3} \dots (20)$$

and—

$$e_1 : e_2 : e_3 :: k_1 : k_2 : k_3 \dots (21)$$

Expressing this result in words, we may say that the current divides itself among the branches of a parallel circuit in the ratio of the conductances, or inversely as the resistances of the branches. If the resistances are equal, the current divides equally. And in passing we may note that the general method of connecting incandescent lamps in practice is to place them in parallel across the mains, as shown in Fig. 1b. If the lamps are the same candle-power and similar make, then—

$$R = \frac{r}{n} \text{ and } e_1 = e_2 = e_3 = \dots = \frac{C}{n},$$

where n is the number of lamps, r the resistance of each, C the main current, and R the joint resistance of the lamps. Again, from (20)—

$$\frac{e_1}{r_1} = \frac{e_2}{r_2} = \frac{e_3}{r_3} \text{ and } \frac{e_1}{e_2} = \frac{r_2}{r_1} = \frac{k_1}{k_2},$$

and—

$$\frac{e_1}{e_2 + e_3} = \frac{\frac{1}{r_1}}{\frac{1}{r_2} + \frac{1}{r_3}} = \frac{k_1}{k_2 + k_3} = \frac{k_1}{K}$$

$$\therefore \frac{e_1}{C} = \frac{r_2 r_3}{r_1 r_2 + r_1 r_3 + r_2 r_3}$$

$$\text{or } e_1 = \frac{r_2 r_3}{r_1 r_2 + r_1 r_3 + r_2 r_3} C \dots (22)$$

Similarly—

$$e_2 = \frac{r_1 r_3}{r_1 r_2 + r_1 r_3 + r_2 r_3} C \text{ and } e_3 = \frac{r_1 r_2}{r_1 r_2 + r_1 r_3 + r_2 r_3} C$$

For a two-branched circuit, as when the branch of resistance r_3 is removed—

$$\frac{e_1}{r_1} = \frac{e_2}{r_2} \text{ and } \frac{e_1}{e_2} = \frac{r_2}{r_1} = \frac{k_1}{k_2} \dots (23)$$

$$\text{Also—} \frac{e_1}{e_1 + e_2} = \frac{\frac{1}{r_1}}{\frac{1}{r_1} + \frac{1}{r_2}} = \frac{r_2}{r_1 + r_2} = \frac{e_1}{C}$$

$$\therefore e_1 = \frac{r_2}{r_1 + r_2} C, \text{ and similarly } e_2 = \frac{r_1}{r_1 + r_2} C \dots (24)$$

All the relationships given algebraically above are very important, and should be carefully studied in connection with the worked examples given below, which have been specially prepared to illustrate one or more principles.

Worked Examples.—Example 1.—If a current of 20 amperes is flowing in a wire of which the resistance is 3 ohms per mile, state what will be the drop in volts for each 100 yards of this circuit? (City and Guilds Institute Examination.)

Since the resistance is 3 ohms per mile;
Since the resistance of 100 yards
 $= \frac{100}{1,760} \times 3 = \frac{30}{176} \text{ watts.}$

And by Ohm's law drop in volts = $e = C \times r$;

$$\therefore \text{Drop in volts} = 20 \times \frac{30}{176} = 3.22 \text{ volts.}$$

Example 2.—A dynamo, giving a constant voltage of 110 volts at its terminals, sends a current of 40 amperes when a certain external resistance is in circuit, and 25 amperes when a lamp is placed in series with the external resistance. What is the resistance of this lamp, and what is the drop in volts between its terminals?

Let r = original resistance in the circuit when 40 amperes are passing, then—

$$110 \text{ volts} = 40 \text{ amperes} \times r \text{ ohms.}$$

$$\therefore r = \frac{110}{40} = \frac{11}{4} \text{ ohms.}$$

If r_1 = resistance of the lamp added, then—

$$110 \text{ volts} = 25 \text{ ampères} \times \left(\frac{11}{4} + r_1 \right) \text{ ohms.}$$

$$\text{and—} \quad \frac{11}{4} \times r_1 = \frac{110}{25} = 4.4.$$

$$\therefore r_1 = 4.4 - 2.75 = 1.65 \text{ ohms,}$$

and drop in volts—

$$= e = C \times r_1 = 25 \times 1.65 = 41.25 \text{ volts.}$$

Example 3.—It is required to place a 100-volt lamp 100ft. from the street-mains, the pressure of which is maintained at 110 volts. Determine the resistance of the connecting wire, given that the resistance of the lamp is 200 ohms?

Since the lamp requires 100 volts, the drop in volts for connecting wire—

$$= 110 - 100 = 10 \text{ volts;}$$

the drop in volts for connecting—

$$= e = C \times r;$$

but the current required for the lamp—

$$= \frac{100 \text{ volts}}{200 \text{ ohms}} = 0.5 \text{ amp.}$$

$$\therefore 10 \text{ volts} = 0.5 \text{ ampère} \times r \text{ ohms.}$$

$$\therefore r = \frac{10}{.5} = 20 \text{ ohms.}$$

It must be noted here that 200 ohms is the resistance of 200ft. of wire—i.e., 100ft. for lead, and 100ft. for return.

Example 4.—What resistance must be added to a circuit to lower the P.D. between two points in the circuit from 100 volts to 95 volts, given that the total resistance of the circuit at first was 57w., and the total E.M.F. of the circuit 300 volts?

Let R = added resistance.

r = resistance between the two points.

C = current passing after the change.

$$\text{then—} \quad \frac{100}{300} = \frac{r}{57} \text{ by equation (15)}$$

$$\therefore r = \frac{57 \times 100}{300} = 19 \text{ ohms.}$$

Again—

$$300 \text{ volts} = C \text{ ampères} \times (57 + R) \text{ ohms.}$$

$$\text{and—} \quad 95 \text{ volts} = C \text{ ampères} \times 19 \text{ ohms.}$$

$$\therefore \frac{300}{95} = \frac{57 + R}{19} = 3 + \frac{R}{19}$$

$$\therefore \frac{R}{19} = \frac{300}{95} - 3 = \frac{15}{95}$$

$$\text{and—} \quad R = \frac{15}{95} \times 19 = 3 \text{ ohms.}$$

It is obvious from this example that the P.D. between any two points in a circuit will be

Example 5.—Find the joint resistance of three 100-volt lamps giving respectively 8, 16, and 32c.p. when placed between 100-volt mains, each lamp taking 3.75 watts per candle.

The lamps take respectively 30, 60, and 120 watts, and since watts absorbed = $E \times C = \frac{E^2}{R}$

$$\therefore \frac{10,000}{r_1} = 30 \text{ and } r_1 = \frac{1,000}{3} \text{ ohms;}$$

similarly r_2 and r_3 for the 16 and 32c.p. lamps are—

$$r_2 = \frac{1,000}{6} \text{ and } r_3 = \frac{1,000}{12}$$

$$\therefore \text{joint conductance } K = \frac{3}{1,000} + \frac{6}{1,000} + \frac{12}{1,000}$$

$$\text{and } \frac{1}{R} = .021 \text{ mho.}$$

$$\therefore R = \frac{1}{.021} = 46.7 \text{ ohms.}$$

The same result may be obtained by considering the current passing. Thus the lamps take respectively 0.3, 0.6, and 1.2 ampères; therefore, total current used = 2.1 ampères. This current is due to a common P.D. of 100 volts overcoming the joint resistance of the lamps in parallel.

$$\therefore R = \frac{e}{C} = \frac{100}{2.1} = 46.7 \text{ ohms.}$$

The distribution of current is shown in Fig. 3.

Example 6.—The joint resistance of two wires connected in parallel is $2\frac{2}{3}$ ohms. If the resistance of one of them is 8 ohms, determine that of the other.

$$\text{By equation (18) } R = \frac{r_1 r_2}{r_1 + r_2}$$

$$\therefore 2\frac{2}{3} = \frac{8 r_2}{8 + r_2} \text{ and } \frac{r_2}{8 + r_2} = \frac{1}{3}$$

when $r_1 = 8$ ohms.

$$\therefore r_2 = \frac{1}{3} (8 + r_2) \text{ and } r_2 = 4 \text{ ohms.}$$

Example 7.—A wire of 10 ohms resistance is connected between mains carrying 2.8 ampères. What resistance must a wire have so that when connected in parallel with the wire of 10 ohms, 2 ampères will pass through the wire of 10 ohms?

The current obviously divides into two parts, 2 and 0.8 ampères respectively, and—

$$\therefore \frac{e_1}{e_2} = \frac{r_2}{r_1} \text{ by equation (20 a)}$$

$$\therefore \frac{2}{0.8} = \frac{r_2}{10} \text{ and } r_2 = \frac{10 \times 2}{0.8} = 25 \text{ ohms.}$$

Example 8.—A current of 1 ampère divides between three wires of 4, 8, and 10 ohms resistance respectively, connected in multiple arc. Determine the current in each branch.

The individual conductances are 0.25, 0.125, and 0.1 mho.

$$\therefore \text{total conductance} = 0.25 + 0.125 + 0.1 = 0.475 \text{ mho.}$$

$\therefore$ the currents in the separate branches are—

$$e_1 = \frac{.25}{.475} \text{ of } 1 \text{ ampère} = \frac{10}{19} \text{ ampère}$$

$$e_2 = \frac{.125}{.475} \text{ of } 1 \text{ ampère} = \frac{5}{19} \text{ ampère}$$

$$e_3 = \frac{.1}{.475} \text{ of } 1 \text{ ampère} = \frac{4}{19} \text{ ampère.}$$

If the current in the main current was C ampères, then e_1 , e_2 , and e_3 would be respectively $\frac{10}{19} C$, $\frac{5}{19} C$, and $\frac{4}{19} C$ ampères.

(To be continued.)

ART AND ARCHITECTURE IN THE SERVICE OF THE CHURCH.

AT the Church Congress now being held at Nottingham, a series of papers were read on Wednesday evening on "Church Art and Architecture." The meeting, which was held in the Victoria Hall, under the presidency of the Bishop of Southwell, was well attended.

The Rev. W. H. Draper, vicar of the Abbey Church, Shrewsbury, in the first paper read, remarked that, to any one who studied the history of architecture, nothing was more striking than the way in which, as a matter of fact, it had shared in the mighty influence of the Christian spirit, and received from it certain characteristics which, in their turn, became fresh witnesses and agents of that spirit's life. The Christian religion counted nothing human as alien from its influence, but

had within itself a power of eliciting new beauty and higher service from all kinds of art natural to man. What were the points and principles to which attention needed most to be drawn? There was need of more personal intercourse and fellowship between the clergy and the artists. Another point that needed attention was the truth that all Church buildings belonged to a living Church, with its past, its present, and its future. They were not simply sacred relics—they were something more even than precious works of art; they were the living instruments of praise and salvation. There was also a need that the public mind of Churchmen should show more response to such new ideas and hopes as were stirring in the hearts of architects and artists of the present time. But the one supreme need of all was that of the spirit of enlightened sacrifice (the first of Mr. Ruskin's "Seven Lamps") in the Church at large, but especially among men of wealth. The heart could not but be quickened at the thought of what might be done when some of our great centres of commerce awoke to their noble opportunities, when the vast wealth now waiting to be consecrated was seen, not as a means of power chiefly, but as a possible means of glorifying God and uplifting man.

Sir William B. Richmond, K.C.B., A.R.A., said that, leaving aside the Classical period, for 400 years and more, from the 11th almost to the 17th century, it seemed as though in Europe the production of an ugly thing was out of the question. In times of turmoil and bloodshed of the Middle Ages, and up to the culminating events of the Reformation—times of excess in vice, of excess in virtue—when there was little or no mediocrity to the front, art flourished. The standard of taste was very high, but at the same time eminently spontaneous and fluctuating. Notwithstanding eager struggles for power, political complications, internecine wars, there was all through the life of the Middle Ages and the Renaissance a keen zest for the arts of peace as well as of war. Cathedrals, monasteries, and palaces were built, upon whose adornments the keenest intellects and the most crafty artisans expended their creative powers and skill. But the modern spirit, full of commercialism, differed from the spirit of ancient times, so appreciative of beauty. Contentment with "the commonplace"—aye, preference for it—had permeated every class and industry more or less, and had crept into the Church, where one would have thought a spirit of "protection" would have been stronger than "free trade." There, as in our public buildings and in our houses, the tradesman was more evident than the artist; the commercial, rather than the creative, instinct. In England, soon after the Reformation, even as early as the reign of Charles I., her churches were destined to become little more than preaching houses, open on Sundays and holy days for the rhetorical display of big-wigged parsons. There was no more art for the churches. Art in a church was like a red rag to a bull. It was a dull period, artificial in the extreme, a period in which it was impossible that any form of imaginative or decorative art, especially of a religious character, should flourish. The father of modern romance, the real author of the Gothic revival, the most imaginative tender-hearted gentleman, Sir Walter Scott, by his poems first and then by his novels, created a new romance. To him they owed the revival, or rather the beginning, of interest in romance. It bore fruit in the noble literature of this century, in the revival of interest in Gothic architecture, and, directly and indirectly, Scott exercised influence upon the graphic arts. In painting, that most interesting revival, the pre-Raphaelite, was an offshoot of Scott's genius. How was it that the most renowned painters of our time had been so rarely employed in the service of the Church, while there had been so much opportunity presented in that direction? The Gothic revival naturally led architects towards antiquarian research. Hence there had arisen a clear definition of the styles of various epochs. To accommodate these it had been sought to permit no decoration in glass, sculpture, or wall-painting which did not belong to the style chosen—13th, 14th, 15th, or of whatever century, Gothic or Renaissance. Surely it was not "style," but "styles," that were wanted; the expression of something that an artist had to say after his own fancy in accordance with such traditions as he had accepted. They would never get art worthy of their religion until they cared for it and realised its

FIG. 3.

materially influenced by the addition or removal of resistances. We shall therefore give a general solution to this type of problem.

Let E = total E.M.F. of the circuit.

R = total resistance of the circuit.

e = original P.D. between any two points in the current of r ohms resistance.

e_1 = the P.D. between the same two points when a resistance of r_1 ohms is added or removed from the circuit.

Now from equation (15), when r_1 ohms is added—

$$\frac{E}{R} = \frac{e}{R} \text{ (a) and } \frac{e_1}{R + r_1} = \frac{r}{R + r_1} \text{ (b)}$$

and dividing a by b we get—

$$\frac{e}{e_1} = \frac{R + r_1}{R} = 1 + \frac{r_1}{R}$$

$$\therefore \frac{e}{e_1} - 1 = \frac{e - e_1}{e_1} = \frac{r_1}{R}$$

$$\text{and—} \quad r_1 = \frac{e - e_1}{e_1} \times R$$

Note.— $e - e_1$ is the drop in volts between the two points.

great importance. They would never get it if they treated it as furniture.

Dr. J. Charles Cox, F.S.A., said a double demand was made on architectural art in relation to the Church. At the present day their architects were called in to restore the old as well as to supply the new. With regard to the former, he held that irrevocable mischief had been accomplished in the past half-century, blotting out for ever, in cathedral and parochial churches, many of the most interesting pages in stone of our ecclesiastical history. Some of our cathedral churches had suffered, too, from the rage for immense organ effects. The average ancient parish church of England had, if possible, endured more wrongs and obliterations than even the cathedral churches. England shared with Russia, and with Russia only, the discredit and the misfortune of possessing no central power whatever to control the caprice or to instruct the possibly historical and artistic ignorance of dean and chapter or of the humbler rector.

The last paper on "The Clergy and Artists' Association" was by Mr. Reginald Hallward, who said that this association, which was opened by the then Bishop of Stepney in May of last year, sought to establish the means through which those desirous of information in regard to the best work which was being done by individual artists might be helped in various ways towards obtaining it. The aim was to bring the clergy into closer relationship with the artist, to draw the artist into closer relationship with the Church, and to strengthen and build up the service of art to religion by directing employment into the hands of the most gifted. He had long thought that an order of community of artists on a definitely religious basis, endowed with funds to send out young artists relieved from all direct money responsibility, supported by the community during the work out of its funds, and in return accepting the restraints which a definitely religious basis must impose on their life and conduct, would have enormous advantages. They said, "Go direct to the artist, and we will help you to this." Not half the artists that could do beautiful work in churches were employed in this direction; but then they did not advertise in the Church papers, and the public said, "We do not know where to go." This evil, at least, this association could help to overcome if the clergy and the public would help also.

NOTES FROM EDINBURGH.

BUSINESS in the building trades continues to be, as it has now been for long, at high-water mark. Masons in many instances command higher remuneration than the standard wage of 9½d. per hour, and others follow. In public works, as well as in private speculation, there has never been so much doing in the city at a time. The demand for middle-class houses is not ebbing, and large sections of new streets are conspicuous in the suburban districts, principally in the north, east, and west, where the lines of tramway run. Masons have taken advantage of the great demand for their services to ask for, and have succeeded in obtaining, what is known as the eight hours' day. Work was suspended for a short period only—long enough, however, to induce many to go elsewhere for work, though with a nine-hour day. Edinburgh alone is trying the experiment, which is to begin in April. There is still much difference of opinion, according to newspaper correspondents, as to the eight-hour day, which looks feasible enough where the work of masons and engineers is laborious; but the experience of some goes in favour of the nine hours, because there is less fatigue in the longer day, with two breaks for rest, than in the shorter, with only one. There is no general adoption of the Utopian idea of an eight-hour day for all branches of industry, and very probably, if any large section of operatives find the shorter day unsuited to their circumstances, it will very soon be set aside.

The present Lord Dean of Guild, Mr. Miller, has held the office by annual re-election for six or seven years, and given great satisfaction; but there have been rumours of an attempt being made for the election of another party when the new council is formed. It will be difficult to find another better qualified, in so many ways for the office than the present occupant, who has not only acquired a thorough knowledge of all the details of the business of the court, but takes an interest

in it, unencumbered by the calls of any other office or professional engagements. The reconstruction of the council chambers has from the first engaged his attention, and his services in this respect alone have been freely given to the city, so that, in all likelihood, he will remain so long as he may desire to hold the office. It is difficult to see what possible advantage could accrue by putting even any other equally eligible man in the place.

The new North Bridge has been opened without the pomp and circumstance one might have thought worthy of such an important improvement. The contrast between this thoroughfare (for nearly two years greatly contracted for the works) is very striking. It is not a greater improvement than many which have been made, more or less gradually, in the last twenty years; but it is more sensibly apparent as a whole, and will be found to be of immense advantage to the greatly augmented traffic of the city. As a feature in the architecture, it is all that could be desired, with a good gradient, and graceful outlines in arch and parapet. Some parties have expressed an opinion that the stone piers would be improved by groups of statuary. The bridge is seen to most advantage from the east, but the arches cannot be altogether eclipsed by the railway sheds on the other side, although it is difficult to see how these can be constructed to be ornamental accessories. The underground buildings, forming the Railway Company's offices, are now commencing the last floor, which will bring them to the level of the bridge, and the ironwork of the sheds on the north side of the access is completed for the roofing, or nearly so. It is of the most ordinary construction, with deep lattice girders covering the transverse trusses.

Operations have been for some time in progress at the Castle, removing the old and rather unsightly buildings at the north end of the lofty barracks building. The new hospital, which will be erected in the Scotch Baronial style, will do much to make the ancient fortress picturesque, and as the barrack tenements have, at least, the advantage of altitude, some little details about the roof and walls could easily make it a better companion to the new addition.

Little has been done this summer in the way of improving the Old Town. In some parts now there is little remaining to be done. The north side of the Lawn Market has been thoroughly opened up. Houses forming a series of narrow closes have been removed, and anyone can enter from Bank-street and emerge into the head of Lawn Market. The old houses retain their dingy character—all repairs carefully restoring what can be retained—and the aspect of the newly-extended courts is very different from that presented by the University Hall Courts. With the exception of some old doorways and inscriptions, there is not much of architectural interest. The only building making a conspicuous exception is one which is being restored by its proprietor, Lord Rosebery. The mason and plaster work of this ancient edifice are nearly complete. The old doorway is in good preservation, with armorial bearings and legend, initials, and date 1622. It was the dwelling occupied by the Dowager Lady Stair (a Primrose), and the close giving access to it is known as Lady Stair's Close. The plan is what the site has made it, with a projection to the south and frontage to the north, where, however, it stands considerably back from the line of streets. This Lady Stair's Close formed the principal thoroughfare between the Lawn Market and the north side, until Bank-street was made, and this access still remains, passing the east side of Lady Stair's Mansion. The most curious and interesting feature of the house is the lofty hall, entering from the octagon staircase, and having the height of two stories. This has been very carefully restored. The south projection in the front has more of architectural detail than the rest. The turret staircase, &c., has a pretty Jacobean balcony, and access to the third floor on the work is provided for by a very elegant verandah passage in timber; and probably the mansion never looked so well at its best in the 17th century.

Notwithstanding the increasing demand for electric-light supply—so great as to make new plant requisite already—the demand for gas supply continues also to increase, and there is every probability of the present gasworks in New-street being taken elsewhere; the present site being far too limited. This will, it is to be hoped, dispose both of the old and new chimney

stack. Nothing has been decided as yet as to the rebuilding of North Bridge-street; but the matter cannot be much longer delayed. The elevations have been arranged for, and the question now awaiting decision is whether the work of construction is to be done by the council or private enterprise.

There has lately been a recurrence of the periodic outcry as to the condition of the thoroughfares within the city. The granite setts appear to be laid in some fashion that makes them much noisier (it is said) than the same roads as laid in Glasgow. The street and roads committee are roughly handled for their lack of enterprise and general mismanagement. For about twenty years they seem to have thought of no other than the wood pavement. This gives all satisfaction in so far as noiselessness is concerned; but it is dirty in wet weather, and the most expensive, and soon requires repair. The latest experiment in this way has been made with hard Australian woods, in a section of South Bridge-street. The hardwood laid in Princes-street stands a little longer than the old redwood blocks, but has had to be repaired already. The durability of rock asphalt is unquestioned, and if it were so very dangerously slippery, it is not likely that the town of Leith would be repeating (as they have done) the experiments they made with it in the Kirkgate about thirty years ago. No experiment with this material has ever been made by the streets committee. The Glasgow authorities have tried successfully a concrete, called tar macadam, costing only 7s. 6d. per super. yard. They are also experimenting with an American patent, which is compounded of the rock asphalt and stone or gravel, with some fibrous material which, in minute subdivision, is said to cure the slipperiness of the asphalt.

The memorial which has been placed in St. Chad's Church, Lichfield, in memory of the forty years' pastorate of the late rector, the Rev. Prebendary Graham, was dedicated by the Bishop of the Diocese on Saturday afternoon. It consists of a carved oak reredos, the central panel containing a representation of Christ as the Good Shepherd. The space too, within the Communion-rails has been laid out with black and white marble, and on the south wall, at the side, has been placed a brass tablet, bearing an inscription.

Thomas Paterson and George Kerr, labourers, died on Friday night in the Royal Infirmary, Glasgow, from injuries received earlier in the day by the collapse of scaffolding at Cambuslang Free Church. Four men were working on the scaffold, and all fell to the ground. Kerr, Paterson, and another man, named Watson, were conveyed to the Glasgow Infirmary, while the fourth, an apprentice, escaped with slight injuries.

On Saturday the members of the North-Western and Midland Sanitary Inspectors' Association held a meeting at Manchester. The chairman, Mr. Urquhart, of Crewe, in submitting the report of the delegates to the Leeds Congress of the Sanitary Institute, congratulated the association on the fact that Dr. Farquharson, M.P., had promised to assist the progress of the Local Authorities (Officers') Superannuation Bill in Parliament, that a sanitary inspector had for the first time been appointed president of the sanitary inspectors' section of the congress, and that sanitary inspectors were granted an opportunity of reading papers in other sections.

Frank Webster, architect, Bradford, was charged on remand at Keighley, on Friday, with travelling without a ticket on the Midland Railway, and with assaulting Sidney Hadley, station-master, Thwaites. Prisoner pleaded that he had been working late, and in consequence had fallen asleep, and been carried beyond the station at which he should have alighted. His pass he had left at a friend's house. He was fined 5s. and costs, and for the assault 10s. and costs.

Rapid progress is being made with the building of the new Era spinning mill at Rochdale, and the bricklayers have commenced work on the top story. It is expected that the roof will be on by the end of the year, and that some machinery will be got to work before March has expired. The building is 315ft. long, inside measurement, and 134ft. wide. The length of it on the canal side is 43 windows, and there are three stories, besides the basement. The first brick was laid in May last. The mill is made fireproof throughout on the brick-arch principle. In the basement are rooms for warehousing and waste, above are the card and blowing rooms (18ft. high); in the next story are the ring-spinning and mixing rooms (also 18ft. high), and in the top room (15ft. high), warping, reeling, &c., will be carried on. Cabias for the overlookers commanding views of their respective rooms, and hot-water kitchens for men and women are being provided.

BOOKS RECEIVED.

First Principles of Electricity and Magnetism, by C. H. W. Biggs, editor of *The Electrical Engineer*, illustrated. (London: Biggs and Co., Salisbury-court, Fleet-street.)—This octavo is a useful introduction to the science of magnetism for all beginners, and is an amplification of a series of articles which appeared in *The Electrical Engineer*, based upon the syllabus of the City and Guilds Institute. Mr. Biggs' book is well illustrated with diagrams and figures of apparatus, and cannot fail to be found of use to the student. Those who want a simply-treated introduction in which first principles are clearly dealt with, will find this book more useful than many treatises of a more pretentious character that have been published of late. The relations between heat and work, and the mathematical principles and definitions, are fully expounded. Thus the units, the "poundal," &c., are well explained by examples. The book is well printed, and is a useful addition to the Biggs and Co.'s Electrical Engineers Series. The price is 3s. 6d.

CHIPS.

The new electric tramways extension from Belfast to Fishponds was officially inspected on Monday, on behalf of the Board of Trade, by Sir Francis Marindin, R.E., and Major Carden, R.E.

Lord Harlech and Mr. Herbert Roberts, M.P., were present at the laying of a memorial-stone at the County School, Llangollen, last week. The school will cost £4,800.

The Hampstead Vestry agreed, on Monday night, to apply for a loan of £3,000 from the London County Council, to be applied towards the purchase of Fortune Green, West Hampstead, as an open space. The Green, which will be laid out and maintained by the vestry, has an area of nearly four acres, and will cost £8,000. Of this sum £3,000 will be contributed by the County Council, a similar amount by the vestry, and £2,000 has been raised by public subscriptions.

The Baptist Chapel at Laxfield, East Suffolk, was reopened last week after external renovation, including reseating with pitch-pine benches, and erection of new gallery and pulpit, at a cost of £500. The works were carried out by Mr. Butcher, of Stradbroke, and Mr. Revell, of Laxfield. A large commemoration-stone has been let into the front wall, bearing an inscription to John Moyes, the Laxfield martyr, who suffered at the stake not many years from the site of the chapel door.

A conversazione took place at the People's Palace, on Monday evening, to mark the opening of the winter session of that institution. About 4,000 students, past and present, were invited, and the whole building was thrown open for the use of themselves and friends. The day-school now comprises over 400 scholars, and the average attendance in the evenings is over 1,000 students. Those who attend the Bow and Bromley Institute were also invited to be present at the gathering.

The interior of the chancel of the parish church of Otterbourne, Hants, has just been decorated with figures in colour and gilding, under the personal supervision of Mr. W. J. Pearce, of Messrs. W. and J. Pearce, of Albert-square, Manchester.

The Light Railway Commissioners held a public inquiry in the County Buildings, Haddington, for the purpose of considering the application made to them by the Gifford and Garvald Railway Company for an order to authorise the above-mentioned light railway. The estimated cost of the line is £88,900.

The Aspley Heath Board Schools, Woburn Sands, Beds, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof-ventilators, and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A new organ built by Messrs. Conacher and Co. for the Congregational Church, Bala, was opened on Wednesday.

A little Roman Catholic church, in the Early English style, costing from £4,000 to £5,000, has been built at Mr. J. Hope's sole expense at Heron's Ghyll, Uckfield, from designs prepared by Mr. F. Walters, F.S.A., of Westminster. It was dedicated last week.

The Bishop of Worcester will unveil on Wednesday next, October 6, the new west window now being placed in St. Philip's Church, Birmingham, in memory of the late Bishop Bowly. The window will form the complement of the series by Sir E. Burne-Jones which already beautify the church.

Lord Wolsley performed on Friday the ceremony of the opening of the new headquarters of the 1st Lanark Rifles in West Princes-street, Glasgow, which have been erected at a cost of £14,000.

Engineering Notes.

BRISTOL.—With the completion of the electric tramway to Staple Hill, which will be ready for opening throughout a fortnight hence, the Bristol Tramways Company will have spent nearly £200,000 on the introduction of electric traction, and they will have a splendidly-equipped power-station, $8\frac{1}{4}$ miles of line, and 27 motor-cars, in addition to other appliances, to show for their money. The electric extension from Eastville to Fishponds, which was opened on Tuesday, has been carried out under the superintendence of Mr. G. T. Edwards, the resident engineer. The posts are of a light character, and the use of span-wires in lieu of brackets reduces the interference with the roadway to a minimum. During the present year some important extensions and improvements have been carried out under Mr. W. Wood, superintending engineer, at the power station at St. George, from which the two sections now opened are worked. Formerly Willans' engines were used, driving with ropes on British Thomson-Houston generators. The station is now equipped with four direct-coupled units, with McIntosh and Seymour engines and British Thomson-Houston generators. Under their latest order the company have obtained powers to provide a new station at Eastville which will be sufficient for the whole of the city, and they are also about to erect a large depot at Staple Hill for the housing of the cars and repairing purposes, at a cost of between £5,000 and £6,000.

DEVONPORT.—The Lords of the Admiralty made an official inspection of Devonport Dock-yard last week. In the course of this tour their lordships visited No. 1 jetty, which is being extended at a cost of £32,000. The work includes the erection of a new sea-wall, a feature of the improvement being the provision of shear legs capable of lifting 100 tons. It is hoped to complete the work early next year. A visit was next paid to the drawing office, which it is proposed to enlarge, and to No. 2 dock, which is to be extended at a cost of £30,000. At the Keyham factory Mr. Goschen considered a proposal to increase the police quarters by building a new wing. They next proceeded to the Royal Naval Engineering College and went over the new wing, which was completed in time for it to be brought into use at the end of the midsummer term. The extension provides over 50 additional dormitories and several instruction and demonstration rooms to meet the growing demands upon this institution. The central dining-room in the old portion of the college is also being lengthened so as to seat 200 students. At the Keyham extension works the members of the Admiralty were met by the contractor, Sir John Jackson, and were conducted to the entrance to a shaft which they descended to a depth of over 80ft. This brought the visitors to the foundations of the wall of one of the four docks. From this point Mr. Goschen and Sir John Jackson led the way through a passage lighted with candles, which, when completed, will be used as a culvert for pumping the water out of the dock. Having regained the surface their lordships had pointed out to them the area of the closed basin, which in itself will occupy $35\frac{1}{2}$ acres of the site.

THE INSTITUTION OF CIVIL ENGINEERS.—The prize-list of this institution for session 1896-7, now made known, contains awards as follows:—The Howard Prize, of the value of 50 guineas, to Mr. Hilary Bauerman, in recognition of his work on the metallurgy of iron; for original papers presented to the Institution, Telford Medals with premiums of books or instruments to Messrs. H. A. Humphrey for "The Mond Gas-Producer Plant and Its Application"; to Colonel Penny-cuik, C.S.I., R.E., for "The Diversion of the Periyar"; to Mr. E. C. Shankland for "Steel Skeleton Construction in Chicago"; to Mr. Dugald Drummond for "High Pressures in Locomotives"; and to Mr. Thomas Holgate for "The Enrichment of Coal-Gas." George Stephenson Medals and Telford Premiums to Mr. G. E. W. Cruttwell for "The Tower Bridge Superstructure," and to Professor Unwin for "A New Indentation Test for Determining the Hardness of Metals." Watt Medals and Telford Premiums to Messrs. Hay and Fitzmaurice for their joint paper on "The Blackwall Tunnel." The Telford Premium list contains the names of Messrs. Donaldson, Ripper, Ravenshaw, Worth, Santo Crimp, Honfray, Nichols, Ramsay, H. D. Smith,

and Major Leach of the Corps of Engineers, U.S. Army. Awards to students attached to the Institution comprise:—The James Forrest Medal to Mr. A. H. Jameson, B.Sc., of Manchester; the Joule Medal to Mr. H. W. Barker; and Miller Prizes to Messrs. Beer, Brand, Berridge, and Kitchen for papers read in London, and to Messrs. Godfrey, Garvie, B.Sc. (Manchester), Carter (Newcastle), and Hurt (Leeds). This year marks the first award by the Institution of the medals named after James Prescott Joule, the discoverer of the Mechanical Equivalent of Heat; and James Forrest, whose long service as secretary and the care devoted by him to fostering the student class, has, on his retirement, been commemorated by the foundation of this medal. The presentation will be made at the opening meeting of the new session on Nov. 2.

LIVERPOOL OVERHEAD RAILWAY AND ITS MOTIVE POWER.—To meet the requirements of extended service on the Overhead Railway, it has been found necessary to greatly enlarge the generating station at the Bramley-Moore Dock. The work being now practically completed, invitations were sent to the members of the Liverpool Engineering Society to be present at the electrical headquarters of the railway on Saturday afternoon for the purpose of inspecting the new section of the works. Luncheon was provided at the Alexandra Hotel, the hosts being Messrs. Holme and King, contractors for the work. Colonel A. H. Holme presided, and there were also present Messrs. S. B. Cottrell (engineer and surveyor to the company, and president of the Liverpool Engineering Society), R. C. F. Annett (honorary secretary), and many members. The party afterwards proceeded to the central field of electric supply for the Overhead Railway at Bramley-Moore Dock. The addition to the generating station consists of two engines built by Messrs. Hick, Hargreaves, and Co., of Bolton, and two new dynamos and switchboard, built by Messrs. T. Parker, Limited, of Wolverhampton. The new engines, dynamos, and switchboards had to be put in position, connections changed over, and the main steam-pipes extended without interfering with the working of the generating station. The engineers for these works and the southern extension of the railway were Sir Douglas Fox, M.Inst.C.E., the late Mr. J. H. Greadhead, M.Inst.C.E., and Mr. S. B. Cottrell, M.Inst.C.E., the latter acting as resident engineer, assisted by Mr. Charles Jones. The structural extension of the generating station, new foundations, and tunnel for cables were carried out by the railway contractors, Messrs. Holme and King, having the personal supervision of Col. A. H. Holme, J.P., assisted by Mr. Fred. Caulton. Messrs. Holme and King were also the contractors for the northern extension of the railway (opened in 1894) and other important works in connection with the railway to Seaforth. Adjoining the engine-room are stores, fitting-shop, and accumulator room.

The supply of properties at Tokenhouse-yard last week was limited, and the returns were consequently considerably below the average for the end of September. The aggregate realisation was £25,170, less than that recorded the previous week, and very far below the amount registered for the same week last year. The attendance, however, was good on each business day, and there were plenty of buyers for sound properties, for which good prices were readily obtained. In striking contrast to the dulness of the market in town, a remarkable activity has set in in the provinces. The market in the country has not presented so encouraging a feature for some years.

The Light Railway Commissioners held a sitting in Aberdeen on Monday to consider an application by the Great North of Scotland Railway Company for permission to construct the Echt (Extension) Light Railway from Kittybrewster to Oldmill, a distance of $3\frac{1}{2}$ miles, entirely within the city of Aberdeen. Mr. P. M. Barnett, the company's engineer-in-chief, gave evidence, and stated that the cost of the extension would be fully £131,000. The cost of the work was largely augmented by heavy cuttings, bridges, and embankments, and the tunnel would entail an expenditure of £31,000. The average cost per mile of the whole railway to Echt would be about £12,000. The application was granted.

The new installation of electric light at Boston Dock was officially opened on Wednesday week by the mayoress. The dock and premises were illuminated by eight arc lamps and 150 incandescent lamps, superseding gas lamps. The work has been carried out by Messrs. Spaglionetti and Crookes, of London, at a cost of £1,682 13s. 11d.

Building Intelligence.

BRADFORD.—The Chancellor of the Diocese of Ripon held a court in Bradford on Friday to hear an application for a faculty authorising the removal of the north and south transepts, the removal of the remains interred in certain graves and vaults, and for other alterations in the city parish church. The works to be carried out now were, it was explained, the removal of the north and south galleries, and the building of a vestry on the north side, and other alterations. The architect is Mr. Healey, of Bradford. The estimated cost of the work to be carried out at once was £4,000, and of that sum £3,300 had been already promised. It would be necessary to take down a small portion of the north wall for the rebuilding of the transepts. The Chancellor, in closing the inquiry, said he believed that the alterations were desirable, and it was the duty of the court to grant the faculty.

GLOUCESTER.—The ceremony of reopening the Lady Chapel at Gloucester Cathedral, after a disuse of more than thirty years, took place on Wednesday. This sanctuary, which was commenced in 1472 and completed in 1498, is one of the purest specimens of the Late Perpendicular style of architecture in England; but year after year it has been falling more and more into decay. The stonework was crumbling, and the roof was far from weather-proof. It is claimed by the restorers that in the work of reparation, not a fragment of the ancient stone has been sacrificed that could by any means have been made use of. Even the bits of stained glass that formed part of the window over the altar have been reset in the ancient tracery. Decayed mullions and transoms have been removed, the mouldings being reproduced. No alteration in the form of the chapel has been attempted; but the ingrained dust and whitewash four centuries old has been removed. The floor has been replaced, stone by stone, tile by tile, and Laud's altar rails have been preserved. The reredos at the east end, described by Sir Gilbert Scott as one of the finest examples of colour-work in existence, has not been touched; but is left in the sadly mutilated condition to which Cromwell's Ironsides reduced it.

HANDSWORTH.—The new Technical School in Gold's Hill-road and Stafford-road, erected by the urban district council, was formally opened on Wednesday. The designs for the school, which has cost £10,500, have been prepared by Mr. William Henman, F.R.I.B.A., the style selected being an adaptation of Renaissance carried out in brick with stone facings. From the main entrance a porch leads to a vestibule with a spacious hall, from which a wide corridor branches east and west. Facing the entrance is a wide staircase flanked by marble and alabaster columns. On either side of the first flight of stairs is a large cloakroom, &c., and under the first half-landing there is a back entrance, as well as access to the caretaker's stairs leading up to his apartments on the second floor. On the east side of the entrance-hall the following accommodation is provided, viz.:—General office, library, and committee-room, two large classrooms, and the science principal's room. On the west side are two smaller classrooms for science teaching, the chemical laboratory, balance and preparation room, and a science lecture-room. Ascending the principal staircase, which above the half-landing is divided into two flights, the upper hall is gained, from which corridors run east and west. At the end of the east corridor is the art principal's room, and two other rooms for design and for life studies. Next to the life room are three rooms for antique and elementary drawing, which are practically one room divided by arches draped with curtains. At the end of west corridor are the modelling and casting-rooms and art lecture-room. Right and left of the main staircase, doors lead out on to asphalted flat roofs, where out-door sketching may be practised. There is access to each floor from the caretaker's staircase, with a lift suited for taking large casts, and there are lavatories at each end of the corridor. Internally the rooms are plain in detail, with the walls tinted in neutral greens, the object being to provide a suitable background for drawings and casts. The rooms will be electrically lighted, the District Council having arranged for an installation which will supply both the school and their own offices adjoining. The contract for the buildings was, after tenders

were obtained, placed in the hands of Messrs. Horton, of Brierley Hill.

MANCHESTER.—A sitting of the Consistory Court was held on Friday in the Manchester Cathedral, Chancellor Vernon Smith presiding. Faculties were granted in respect of applications for the following purposes:—To reroof, reseal, and re-floor the parish church of Admarsh-in-Bleasdale, extend the chancel, and remove the choir stalls; to remove certain seats in the nave and side-aisles of Holy Trinity Church, Preston, also one of the two pulpits, to form a quasi-chancel with choir seats, raised above the present level of the floor, to form the upper room in the tower into a choir vestry, and to form a small side chapel; to make considerable alterations in the interior and exterior of the Longridge parish church; to take out of St. Matthew's Church, Stretford, the present glass from the window at the east end of the church and replace it with stained glass; to replace in St. Matthew's Church, Ardwick, the present pulpit of stone and brick with one of stone and marble; to remove the old window over the baptistery in St. Peter's, Ashton-under-Lyne, and replace it with one of stained glass, and to replace old woodwork round the baptistery with a new oak screen; and to take the present glass from the window at the east end of St. James's Church, Daisy Hill, and replace it with a window of stained glass.

MIDDLESBROUGH.—The foundation-stone has been laid of a block of buildings which is being erected for the Middlesbrough Co-operative Society in Linthorpe-road. The plans of the buildings were prepared by Councillor W. G. Roberts, of Middlesbrough, and the new premises will have a frontage to Linthorpe-road of 87½ ft., to Clifton-street of 110 ft., and to Pelham-street of 70 ft., the whole block occupying an area of 6,753 sq. ft. There will be four shops—viz., grocery, drapery, boots and shoes, and butcher's, all being fronted with mahogany, and having recessed and tiled entrances. There will also be a boot-repairing shop in Pelham-street, and cellars, warehouses, and show-rooms, the latter being on the first floor, where also will be situated the directors' room; whilst the clerks' offices, &c., will be above the grocery warehouse. On the second floor there will be a public hall 67½ ft. by 52 ft., and two other large rooms 48 ft. by 40 ft. and 40 ft. by 26 ft. respectively. The three street elevations will be faced throughout with Accrington red-pressed bricks, with stone dressings, and there will be granite pilasters between the several shops. The work is being carried out by the following contractors:—Excavating, brickwork, masonry, &c., Messrs. W. and H. Pounder; plastering, &c., Mr. J. R. Smiles; carpentering and joiner work, Mr. W. Thompson; slating, Mr. J. Harrison; painting, Mr. J. H. Hill; plumbing, glazing, and gas-fitting, Messrs. Dunning and Walton. All the contractors belong to Middlesbrough. The total cost will amount to about £10,000.

ST. DAVID'S CATHEDRAL.—An interesting discovery has been made at this cathedral. In the middle of the east wall of the chapel, which was built by Bishop Vaughan, whose episcopate lasted from 1509 to 1526, between two niches, stood the principal altar, and right and left of it were originally two windows, looking into another chapel eastward. These windows seemed to have been blocked with solid masonry almost as soon as they were built. In Bishop Vaughan's chapel nothing was to be seen but smooth ashlar; but on the back of the wall the outline of a faint and four-centred arch could be traced. The cathedral has just been visited by Mr. John O. Scott, the cathedral architect, and under his direction the walling was removed to see if the blocked windows contained any remains of tracery. To the surprise of himself and others, they prove to have elaborate tracery, with several interesting peculiarities, and are richly moulded. They are windows of three lights, with stanchions and saddle bars, but were never glazed. In the spandrels are to be seen four shields, with coats of arms, one belonging to Bishop Vaughan, the builder of the windows, and the other the arms of the Cathedral Church of St. David's. The other two remain to be identified. When the windows were blocked, small squints, or "hagioscopes," were formed obliquely through the blocking walls, which looked on to the altar in King Edward the Confessor's Chapel on the one side, and the altar in St. Nicholas's Chapel on the other side.

SHREWSBURY.—The ancient church of St.

Alkmund was reopened on Friday after partial restoration. As soon as further funds are obtainable it is proposed to fill in the windows with stone tracery, and improve the flat plaster ceiling with wood principals and panelling, and to open out to view the ancient tower arch (now blocked up with a brick wall). The work just executed has been the removal of the west gallery (which was rotten and unsafe), the lowering and reconstruction of the seating, putting concrete and solid wood-block floors under same, in place of the old boarded floors, which were in a bad state of dry rot; the formation of a chancel by throwing out a projection into the nave, in which are placed oak stalls for the clergy and choir; and the erection of oak screens, for forming vestries and organ-chamber. The organ, which formerly stood in the west gallery, is now placed in the chancel. The new chancel floor is paved with blue stone in squares, the sacarium with polished coloured marbles, and an oak-traceried pulpit is placed against the north screen. One of the nave windows has been filled in with stone tracery and cathedral glass, and it is proposed later to fill in the other windows in a similar manner, though with some variety in detail. A new porch has been erected on the south side of the church. The old porch at the east end of the church has been built in, and forms a choir vestry. The whole of the work has been executed by Mr. R. Price, builder, of Shrewsbury. The architect was Mr. A. E. Lloyd Oswell, of the same town.

CHIPS.

At Tockington, near Almondsbury, a new Methodist Free Church was opened last week. It is built of local stone, with Bath stone dressings, and is furnished in pitch pine. Mr. A. Dowling, of Bishopston, Bristol, was the builder.

The work of executing the statue of the Queen, which has been subscribed for by members of the Junior Constitutional Club in Piccadilly, in commemoration of the Diamond Jubilee, has been entrusted to Mr. Brock, R.A. The statue, which will represent her Majesty a little over life size, will be placed in the vestibule of the building.

Salem Chapel, York, was reopened last week after renovation. The improvements in the chapel have been carried out from a design and under the superintendence of Messrs. Penty and Penty, architects, Mr. T. Welburn having been the builder.

Owing to the increase in the numbers at Mill Hill school, it has been found necessary to provide further accommodation for the boys. The additional premises are in process of preparation, and will be available for use next term. The governors are also erecting a number of new studies for senior boys, and extensive chemical and physical laboratories, with a large lecture-room. A large school-room, to accommodate 250 boys, and the new chapel will be ready early next year.

In the newly-issued volume of "Army Regulations," alterations or additions have been made with regard to annual inspections by principal medical officers of the sanitary conditions and water supply in all camps, barracks, hospitals, or other War Department buildings within their districts; also of the cubic air space allowed for each bed in the wards of the various types of military hospitals at home stations.

By the will of Miss E. E. Gibson, who recently died in Durham, the National Portrait Gallery has obtained a fine example of Romney's art. This painter did not often introduce several figures into one picture, but in this there are four or five. Miss Gibson was the sister of Mr. William Sidney Gibson, whose "Tynemouth Priory" and other works are well known, and the picture contains portraits of their grandfather, Adam Walker (Philosopher Walker, author of "The Original"), and of his wife and baby and two grown-up sons. He is exhibiting an orrery to them by artificial light.

At Exmouth the foundation-stone was laid last week of a Jubilee Memorial clock tower, which is to be constructed facing the sea front, and adjoining the grounds of the Imperial Hotel. When completed the tower will stand 45 ft. high, and will, in the main, be constructed of Bath stone. The dressings will be of limestone, and around the base will be an iron railing. The tablets bearing the inscriptions are to be of Aberdeen granite.

The dedicated stone of a new church at Bassett, South Hants, was laid on Wednesday. The site is on the Winchester-road, Bassett, and it will be a daughter church to the parish of North Stoneham. Mr. J. W. Fleming has given the site, and when completed the church will hold between 400 and 500 people. However, at present it is only proposed to complete a sufficient portion of the church to seat 200 people, at a cost of £2,400.

PUBLIC BATHS AT ALLOA.—STONEHOUSE PARISH CHURCH, LANARKSHIRE.—DECORATION OF A DRAWING ROOM FIRE-PLACE.—NEW PREMISES, BRIDGE STREET, CHESTER.—NATIONAL BOOK PRIZE: VIEW OF A STAIRCASE.—“TOTTERDOWN,” WESTON-SUPER-MARE.

Our Illustrations.

ALLOA NEW PUBLIC BATHS.

THE new public baths in course of erection in Alloa, the gift of Mr. J. Thomson Paton to the burgh, are situated at the corner of Primrose-street and Primrose-place, the main entrance being from Primrose-street and close to the corner. The building contains a billiard and amusement room, with newsroom and ante-room; a swimming pond, with its accessories; a first and second-class plunge bath department; a Russian bath department; and a large gymnasium. These departments are so placed that, while each has an independent access, inter-communication is easy. On the ground-floor, immediately on either side of the main entrance, are the billiard and newsrooms, with their ante-room, and immediately beyond the entrances to those rooms, so that access may be free, is the booking and towel office. A wide corridor in front of this office gives immediate access to the other departments of the building. The swimming-pond hall, extending from this corridor through a spacious vestibule, is a large room, 98ft. by 50ft., having an open timber roof averaging 25ft. high from the floor. The pond is 75ft. by 33ft., and of varying depth, the shallow end being specially prepared for the use of children. On either side are dressing-boxes, 47 in all, and at the deep end a room for the use of the various swimming clubs that may be formed by frequenters of the baths. A large dressing-room and washing-room for school children are provided at the entrance end. A washing-room for adults, with the usual conveniences, is situated close to the clubroom. As it has been found that such ponds have been used for water carnivals and other entertainments, a gallery has been provided over the dressing-boxes and over the entrance vestibule for spectators, who have thus not only a full view of the pond, but look towards the club-room, from which all such entertainments would be directed. Special access is provided to this gallery without bringing the public in contact with the bathers. The second-class plunge-baths, 10 in number, on a slightly lower level than the pond, are entered from the main corridor immediately behind the ticket-office. Each bath is placed in a room by itself, supplied with hot and cold water, and well lighted and aired. A special access is provided to the swimming pond. The first-class baths, on an *entresol* floor immediately over the booking-office, are reached from the same corridor by a stair rising from the side of the entrance to the second-class baths. They are the same as the second class baths, but these bath-rooms are larger, and each is provided with a washhand basin. The Russian bath department, at the far end of the swimming-pond hall, is reached either from the gallery of the hall,

through the second-class baths, or by an independent access from Primrose-place. It consists of a small vestibule with booking-office, cooling-room, 26ft. by 16ft., with separate couches for five persons; Russian bathroom, 16ft. 6in. by 9ft. 6in., and a washing-room. The gymnasium, 76ft. by 28ft., having an open-timber roof, average 22ft. high, occupies the whole of the first floor of the pond building over the billiard and newsroom, &c., the necessary dressing-rooms being provided over the first-class plunge baths fronting Primrose-place. A spectators' gallery is placed at the end. The heating and water supply arrangements have received special study, the boilers, &c., being placed at the far end of the building at Primrose-place beneath the Russian bath department, where light and air are ample, and a ready access can be obtained from Primrose-place for fuel. The washing-house and laundries are placed immediately behind the heating department, and the towel-drying room is specially ventilated to the main boiler-house chimney. Externally, the building is designed in a free treatment of French Renaissance. The cost of the baths will probably be about £20,000. The architect is Mr. John James Burnet, A.R.S.A., of Messrs. John Burnet and Son, 167, St. Vincent-street, Glasgow.

STONEHOUSE CHURCH, LANARKSHIRE.

THE church, of which the exterior and interior views are shown, is in course of erection at Stonehouse, Lanarkshire, and will provide accommodation for 550 sittings. The materials for the outer walls are of a light grey stone from a local quarry, while the piers and arches of the interior are of red sandstone from Dumfries. The roof over nave is constructed of steel and encased with wood. The seating is to be of pitch-pine, slightly stained and varnished. The total cost is £4,000. The contractors are all local tradesmen. The architect is Mr. Alex. Cullen, of Hamilton and Motherwell, N.B.

DECORATION OF A DRAWING ROOM FIREPLACE.

THE drawing from which this illustration is taken was hung on the walls of the architectural room at the Royal Academy this year. The author of the design is Mr. H. Dymoke-Wilkinson, architect, who writes:—"There is really but very little to be said in addition to the notes which appear upon the drawing with regard to this fireplace. It was designed to be erected in an old West End house, the large drawing-room of which is magnificently decorated in the style of the Second Georgian period, the ceiling being in the Italian style, richly moulded, and interspersed with leaves, fruit, &c., and having worked into it small medallions (paintings in oil colour) of Cupids and Amoretti. The walls are hung with very rich old yellow silk damask, into which are framed large dark portraits in gold frames. The floor is stained black and polished, with some rich Persian rugs laid about, whilst the woodwork is everywhere in cream and gold. The furniture of the room is gilded and upholstered in apple-green and strawberry-coloured damasks, so that in designing the fireplace it was necessary to so do primarily as a matter for elaborate colour decoration, &c."

NEW PREMISES, BRIDGE STREET, CHESTER.

THIS site was formerly occupied by dwelling-houses and shops, which have been pulled down to make way for the buildings now in course of erection for the Duke of Westminster. They consist of a shop on the street level, with warehouse premises above. The timber work is oak, and the roof will be covered with green slates. The contractors for the work are Messrs. Parker Bros., and the architects Messrs. Douglas and Fordham, of Chester.

NATIONAL PRIZE DESIGN FOR VIEW OF STAIRCASE.

THIS illustration which we give to-day was reproduced from the artistic and spirited drawing for which Mr. Edward M. Southgate gained a Book Prize in the National Competition. The staircase, though its exact date is uncertain, is situated on the west side of the Cloister Court of Queens' College, Cambridge, and was originally the entrance to the president's lodge. Queens' College is one of the most picturesque of all the colleges, and retains its old-world character more completely than any other. It is named after its foundress, Queen Margaret of Anjou. The famous Erasmus resided here, and his rooms are still pointed out, not far from this staircase, which leads out of the cloisters.

"TOTTERDOWN," WESTON-SUPER-MARE.

THIS house has undergone extensive alterations, costing upwards of £4,000, from the designs and under the supervision of Mr. S. J. Wilde, architect, of Weston-super-Mare, for Mr. E. M. Whitting. The contractors were Messrs. R. Wilkins and Sons, of Bristol. The new porch forms the principal entrance to the house, and the carving, which is executed in fine style, was done by Mr. Smith, also of Bristol. The stone is Corsham Down, leaded lights being used for the windows, and a red tiled roof.

CHIPS.

The measured drawings of the Gate House, Lostock Hall, illustrated by us on the 17th ult., were executed by, and should have been credited to, Mr. John Ormrod.

The parish church of Stanway, near Winchcombe, on the Gloucestershire estate of the Earl of Wemyss and March, was reopened on Saturday, after complete restoration, at a cost of about £2,000, which sum does not include that for fittings and furniture.

A window was unveiled on Saturday in the church of Theydon-Bois to the memory of the late Miss Frances Mary Buss, founder of the North London Collegiate School for Girls. It illustrates the words from "The Pilgrim's Progress":—"The Interpreter called a servant of his called Greatheart. 'Take these my daughters,' said he, 'and conduct them to the House called Beautiful.'" The window overlooks Miss Buss's grave in Theydon-Bois churchyard.

The foundation-stone of a new Wesleyan chapel was laid at Prudhoe-on-Tyne on Saturday. The building will be built of dressed stone, and the style will be Gothic. Seating accommodation will be provided for £400, and the cost is estimated at £2,000. The architect is Mr. John Mackay, Kingswood, Bristol, and the builder is Mr. Mauchlen, Newcastle. It is intended to use the old chapel for a Sunday-school.

The foundation-stone of additions which are to be made to the church of St. Andrew, Porthill, Wolstanton, was laid on Saturday afternoon. The extension will consist of a south aisle, transept, vestry, south entrance, and porch. The new work will be of stone, to correspond with the existing structure, and the contract, which is for £780, has been let to Messrs. Yorke and Goodwin, of Tunstall. Messrs. Wood and Hutchings, architects of the present church, have drawn the plans for the extensions.

The new organ at Bangor Cathedral was inaugurated on Tuesday by Sir Walter Parratt. The organ, a four-manual instrument, built by Messrs. Hill from a specification by Mr. T. Westlake Morgan, the organist of the cathedral, contains 87 registers, with 64 speaking stops, and 3,742 pipes. The console on which the performer plays is detached, and is placed in the north transept. A good many of the most valuable pipes in the old Bangor organ have been incorporated in the new.

The demolition of a section of the Hanover Buildings, Tooley-street, immediately facing the southern end of the Tower Bridge, is in progress, and is the first indication of the commencement of the new roadway which is to be made by the London County Council extending from the Tower Bridge to the Old Kent-road. The local authorities are being approached by the County Council with a view to obtaining their consent to the new thoroughfare being lit with the electric light, and to apportioning the charges to the several parishes.

The directors of the Aberdeen Town and County Property Company have accepted tenders for a new block of property to be erected at the corner of Rosemount Viaduct, Skene-terrace. The estimates amount in the aggregate to £15,000.

The Runcorn Free Library is about to be enlarged from plans prepared by Mr. J. Wilding, the surveyor to the urban district council. This plan proposes to add the present reading-room to the library, and to erect new reading-rooms facing Egerton-street. The estimated cost of the alteration is £600.

Sitting at Fraserburgh, on Friday, the Light Railway Commissioners, the Earl of Jersey presiding, Mr. Gerald Fitzgerald, barrister, and Colonel Boughey, R.E., recommended the construction of a light railway from Fraserburgh to four adjoining fishing villages. The cost of the proposed line would be £13,844, exclusive of land and cost of widening the existing Great North Railway.

At a meeting of the local Burns Memorial Society, held at Mauchline, N.B., on Saturday, Mr. William Fraser, of Glasgow, the architect, reported that the cottages were well forward, but that it would be some time before the tower was finished. The memorial fund now stands at £3,000. The tower and cottages were illustrated in the BUILDING NEWS for Jan. 22 last—p. 119 last vol.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., LI., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

T. MORROW.—Better let the boy attend the classes at the People's Palace, or some other good school of science and art. Phenology is not of much use, we fancy, as a guide to aptitude for building construction.

RECEIVED.—C. R. G.—T. K.—J. B. T.—S. A. S. P.—T. A. and Co.—M. L.

Correspondence.

POOR MORTAR.

To the Editor of the BUILDING NEWS.

SIR,—I can fully endorse the letter of Mr. H. C. Stangand in your issue of the 17th inst. as to the evils of the bad mortar used by some speculating builders. At the same time, one also regrets, with "W. E. M.," that so many building men have but loose and hazy notions of the chemical phenomena connected with their business.

It is perfectly true that the chief chemical change which takes place in the setting of mortar is the absorption of carbon dioxide by the freshly-slaked lime from the atmosphere. It is also true that silicate of lime is formed by the action of calcic hydrate upon the silica of the sand contained in the mortar.

Your correspondents, however, seem to have overlooked the fact that the former reaction can, and does, only happen where the air has access to the mortar—i.e., chiefly on the outer surface—and that, consequently, this cannot go on when mortar is immersed in water, or in any other position where the air cannot penetrate.

Also, respecting the latter reaction, it has been ascertained, by careful analysis of old mortar, that the silicate of lime formed by lime and sand alone is but a very small percentage of the whole bulk of mortar—in fact, so small, that its effect in hardening may be practically neglected.

The constituent which gives to our best limes their valuable qualities—viz., the clay, or

hydrated silicate of alumina—seems to have been entirely lost sight of by your correspondents. All our best authorities seem to be agreed that the power which good stone limes and lias limes have of setting where the air cannot get to them is due almost entirely to the proportion of clay they contain, and that within certain well-defined limits the more clay a natural limestone contains, the more hydraulic will be the lime produced from it. When such limes are slaked after having been properly burnt, various hydrated silicates of limes begin to form, which will harden and crystallise even under water.

It appears that the hardening of the purer limes which have little or no clay in their composition is owing, to some extent, to the fact that the particles of slaked lime cling with greater tenacity to the grains of sand than to each other. A certain amount of crystallisation also takes place, which helps to harden the mass.

It need hardly be said, of course, that clay as a constituent of mortar is worse than useless, unless it has been previously mixed most intimately with the limestone, and calcined with it.

This explanation in no way affects the original question propounded by "A. H.," except that one is forced to the conclusion that the particular mortar used by those Romans, who kept it in pits for two years, could not have been made of good grey or stone lime, otherwise it must have become completely set long before the end of that period.

Being always ready to learn, I should be glad to hear a little more as to the precise nature and setting powers of the Roman mortar referred to.—I am, &c., H. BUSBRIDGE.

SIR,—The letter of "W. E. M.," in your issue for September 3, is a very pretty bit of self-advertisement of your correspondent's profound reading. When I penned the sentence, "Limestone, when burned, becomes oxide of lime (CaO), chemically called 'calcic oxide,'" I purposely used the expression "oxide of lime" instead of "oxide of calcium," because many of my readers would not know that calcium is the metal of which lime is the oxide, and it is more casually referred to (of course, incorrectly), as "oxide of lime" by non-chemists. So that your readers should not suppose that I was writing on a subject of which I know nothing about, like so many fools who rush into print, I also gave the chemical name for the material—viz., "calcic oxide." The answer to the question at the end of your correspondent's second paragraph is that the CO₂ is imbibed by the lime, for the air, when freely exposed thereto is in a pulverulent state, and the object of putting in pits was to cause it to lose whatever amount of CO₂ it had imbibed while in transit from the quarries, and at the same time prevent any further imbibition of CO₂. Altogether, your correspondent is a trifle too hypercritical. The next time he writes I hope he will have something to say worth occupying your space with.—I am, &c., H. C. S.

ERRATUM.—Where "pots" appears, please read *pits* in my last letter.

SIR,—There is an error in my last letter—mine or printer's—13th line down, should read, "Will be dissolved gradually by the water, not 'lime.'"—I am, &c., W. E. M.

The Baptist Chapel at Walton, near Felixstowe, which was built in 1812, had been practically unaltered until recently, when it was decided to remodel the edifice in harmony with modern requirements. A new porch and main entrance have been provided, the walls renewed, and the roof altered and slated. Internally the building has been reconstructed. The floor is new and so are the benches (replacing the ugly high pews), the pulpit, baptistry, galleries, and ceiling. Mr. Alfred Condon, F.R.I.B.A., Westminster, is the architect, under whom Mr. Robert Girling, Ipswich, has carried out the work. The reopening took place last week.

The new children's ward at the County Hospital, York, of which the Duke of Cambridge laid the foundation-stone on Thursday last week, is to be built from plans prepared by Messrs. Demaine and Brierley, architects, of York. The buildings will be faced with red brick, with stone dressings, and will have teak floors and tiled walls, and will allow each patient 1,500 cubic feet of space. The contracts for building have been let at £3,600, as follows:—Brick and stone work, Mr. Geo. Walker, Stonegate; carpentering and joinery, Messrs. Hick and Hobson; plumbing, Mr. T. G. Hodgson; painting, Mr. John Thomas; slating, Mr. J. Hardgreaves; plastering, Messrs. Francis Hall and Son. All the tradesmen are citizens of York.

Intercommunication.

QUESTIONS.

[11794].—Parpoint Facing with Brick Lining.—In the issue of this paper of August 28, of last year, page 292, in "Adaptable Specifications," I find Durford Bridge parpoint facing with brick linings mentioned. I would like to ask any reader if there is such a term applied to walling. I have always understood that parpoint work is composed of stones, finished and intended to be seen on both faces, and if so, why the brick lining? The courses, too, are mentioned not to be less than 3in. in height or more than 5in., so that the latter would not range with the brick courses, but make bad work. Perhaps this can be explained.—GALLATOWN.

[11795].—Water Supply.—I wish to supply water to some houses from a well which is at a higher level than the houses. My idea is to siphon it out over the top of the well, which is about 20ft. deep. Will any competent correspondent kindly inform me of an easy way of charging the siphon, without the aid of a plumber, in the event of its ceasing to act? The houses are in an isolated district, and remote from plumbers or other skilled labour. Stopcocks or valves on the siphon might be used; but the one at the bottom of the well would be difficult to work, and I wish to avoid the expense of a pump to exhaust the siphon. N.B.—The well is about 100 yards from houses, and the bottom is 20ft. above the top floor.—SYPHON.

[11796].—Joists.—If, instead of plastering to a concrete ceiling, wood ceiling joists are used, partly buried in the concrete, and then lathed and plastered, will the ceiling joists become rotten?—F. K.

[11797].—Contracts.—I have a contract under notice, in which an error has been made in extending a provisional amount in a priced bill of quantities. The sum of 50s. (fifty shillings) was provided for unforeseen works, but the contractor extended it as £50 in the money column. Some amount of work for which the provision was inserted has been carried out, and the contractor has charged for this at contract rates, and allows only the £2 10s. provided as above. Can I claim the £50 on behalf of my client? A reply from any reader with reference to a case that has been decided on similar lines will be much esteemed.—SURVEYOR.

REPLIES.

[11790].—Fences.—The ownership of a fence can generally be ascertained by the side the wooden posts are fixed, or the way the nails of the palings are driven. These are always towards the owner's side, the points of the nails being on the side of the owner. It is not so easy to determine the ownership of a brick wall, unless it is user.—G.

[11790].—Fences.—In London and the South of England it is the custom to place the fence-posts upon the ground of the owner of the fence, the face of the palings being towards the adjoining owner. Consequently, the points of the nails should be towards the side of the owner of the garden.—H. BUSBRIDGE.

[11791].—Building By-Laws.—The rights of building and adjoining owners are not defined in the local building by-laws, which is, perhaps, to be regretted. Party-wall is defined thus: (a) "A wall forming part of a building, and being used, or constructed to be used, in any part of the height or length of such wall, for separation of adjoining buildings belonging to different owners, or occupied or constructed, or adapted to be occupied, by different persons; or (b) a wall forming part of a building, and standing in any part of the length of such wall, to a greater extent than the projection of the footings on one side, on grounds of different owners."—ARCHITECT.

[11792].—Architectural Book.—There are many books of the date mentioned treating on "elegant and useful designs." The book may be of value, if scarce. I do not know the author's position as an authority. The best plan will be for "Inigo" to take it to an old art bookseller.—A BIBLIOPHILE.

CHIPS.

The new Public Hall and Technical College at West Hartlepool were formally opened yesterday (Thursday) by Sir Philip Magnus.

A reareds which has been erected in the St. Luke's Church, Cradley Heath, in commemoration of the Queen's Diamond Jubilee, was dedicated on Thursday in last week by the Very Rev. R. W. Forrest, Dean of Worcester. The work has been executed by Mr. H. O. Burgess, of Old Hill.

A new Calvinistic Methodist chapel is being erected at Edeyn, South Carmarvonshire. The contractor for the chapel is Mr. G. Jones, of Morfa, and the architect Mr. R. Lloyd Jones, of Carmarvon.

At the last meeting of the Rochdale Board of Guardians a committee brought forward a proposal for the erection of cottage homes for children, and submitted plans prepared at their instructions by Messrs. Butterworth and Dunan, architects, of Rochdale, the total expense of the scheme being estimated at about £15,000. After a long discussion the scheme and report were rejected.

A crowded meeting of landlords and tenant-farmers of the county of Norfolk assembled in the Shire Hall, Norwich, on Saturday afternoon, for the purpose of presenting his portrait to Mr. Clare Sewell Read, who for many years in and out of Parliament has rendered valuable services to the cause of agriculture. The portrait is the work of Mr. Shannon, A.R.A., and will be permanently hung in the Castle Museum at Norwich.

COMPETITIONS.

ST. HELEN'S.—In a competition for new schools and mission church, to be built in connection with Eccleston Church, designs were submitted by a limited number of architects in the district, including Liverpool and Southport, and the plans of Mr. F. S. Biram have been selected. The building is to be used for day and Sunday-school purposes and as a mission church. Accommodation will be provided in the day schools for 250 children.

STONEHAVEN.—The designs submitted by Messrs. J. and J. A. Souttar, architects, 42, Union-street, Aberdeen, have been awarded the first place by the professional assessor in the competition for a Corporation lodging-house, and these architects have now been instructed by the commissioners to proceed with the preparation of the working plans, with a view to an early commencement of the building. The selected site is on the south side of Cowle-lane, to which the building will have a frontage of 52ft., extending 63ft. back. The front elevation shows a two-story building. The main entrance is in the centre, and leads to an entrance hall, from which, to the right, is the day-room, with scullery, superintendent's office, and shop; while to the left the superintendent's house, comprising kitchen, parlour, bedroom, and bathroom is placed. To the rear, in the main building, is a dormitory for twelve cubicles with bathroom and lavatory. The outbuildings consist of a washhouse for use of lodgers, store, coal cellars, and lavatory accommodation, with an airing yard. The staircase, which is situated in the centre of the building, commands all the dormitories. The upper floor consists of three dormitories, containing 28 cubicles, with ample lavatory accommodation, a sick-room being provided in addition. The cubicles or bed spaces are separated from each other by screen partitions, and each has a separate window.

CHIPS.

The Croydon Town Council have decided to spend £40,000 in kerbing, channelling, and paving works.

The plan of Messrs. Sharman and Archer and Brown and Fisher, of Wellingborough, joint architects for the new infirmary to be erected in that town, has been accepted. The estimate is £3,300.

The Old Mill, at the top of Shoot-up Hill, Edgware-road, Kilburn, is about to be replaced by a site of residential flats, with a return facade to Mapesbury-road. The new building, which will contain 16 self-contained suites of apartments, will be faced with red brick and stone. Messrs. F. Falgrave and Co., of Westminster, are the architects, and the outlay will be about £12,000.

The members of the Institute of Certified Carpenters recently visited St. Paul's to inspect its architect's famous dome and roof. Mr. T. M. G. Lloyd, hon. sec., conducted the visitors, explaining at certain stages the principles involved in the construction.

A new Wesleyan Methodist Chapel at Cheddar was opened on Tuesday. The chapel, which is a cruciform structure in the Early English style, is built of dressed Draycott stone, with freestone facings, and consists of a nave, north and south transepts, chancel, and gallery. The east end window is filled with stained glass (subject, "Sermon on the Mount"), while the remainder are filled with cathedral glass. The north transept is occupied by the organ and choir-stalls, while the chancel is furnished with a carved oak altar-table and chairs. The roof is an open one of pitch-pine and white woods, unvarnished. The building, which is lit throughout with the incandescent light, provides seating accommodation for 350. The pulpit is of carved pitch-pine.

Mr. Adler, architect, of London, has been engaged in making an examination of the tower of St. Mary's Church, Dover, previous to preparing plans for its restoration. The tower is in a dilapidated condition. Under the directions of the architect, Mr. W. T. Dowle, sen., builder, made an excavation some 10ft. deep, so that the foundations could be examined. These proved to be nodules of chalk. In the course of making the excavation, one of the Roman baths which were known to have existed on the spot was unearthed.

Mr. James Crocker, F.R.I.B.A., of Exeter, was on Wednesday week elected surveyor to the Exeter Benefit Building and Freehold Land Society, in succession to Mr. W. S. Croote, who has retired from practice through indifferent health. The board have passed a resolution of thanks to Mr. Croote for his past services and that of the firm for the past 30 years.

LEGAL INTELLIGENCE.

SIDE STEPS TO COMMUNION TABLES.—Lord Grimthorpe, as Chancellor of the Diocese of York, delivered judgment on Thursday in last week at the Consistory Court in that city in the case of the Rev. T. J. Miller, vicar of South Cave, who applied for a faculty to erect in that church a carved oak communion table and reredos. The application came before the Court some time ago, when the lay rector and patron of the living, Mrs. Barnard, of Cave Castle, opposed the same. The Rev. T. J. Miller was presented by Mrs. Barnard to the living in August, 1895, when, according to affidavits put in, the new vicar undertook not to adopt the eastward position nor yet to introduce a cross into the church. It was suggested that he had not kept his promise, and, with reference to the proposed faculty, Mrs. Barnard objected to the whole reredos, including a proposed cross, because it would, as alleged, partly obscure the east window, of fine old stained glass which was brought from Holland at considerable cost by one of her predecessors. The substitution of a new communion table was also objected to as unnecessary, the present table being perfectly sound and in good condition and put in by Mr. J. L. Pearson, R.A., as architect when the late lay rector restored the chancel. There was some contradiction as to the design of the proposed new communion table, and the Chancellor said the question was raised whether it was a *bond-fide* table at all. It was quite a mistake to imagine that the decisions against stone tables sanctioned a sham one made of wood. Mr. Prideaux, Q.C., in his "Churchwarden's Guide," doubted their legality. And the Court of Arches in "Bradford v. Fry," which had never been overruled, disallowed steps round the north and south side of a communion table, on the very ground that they made it look like an altar. He himself had always followed that judgment, and meant to do so until it was overruled, and not merely disregarded by some inferior Court, or by architects and clergymen unlawfully. The Chancellor severely commented on the conduct of the vicar. He refused the faculty, and condemned the promoter, Mr. Miller, in the costs.

WHAT IS A BUILDING?—At the Ilfracombe Petty Sessions, on Friday, Albert Edward Copeland was summoned by the urban district council for having erected a building without depositing plans. Mr. Seldon, for the council, said Mr. Copeland had erected a building, known as the Harmonic Retreat, opposite the Victoria Pavilion, without sending in any notice or plans to the council. The building was of wood and canvas. There was a stage, upon which during the season performances had been given. By the sides of the stage were two boxes used as dressing-rooms. The council, in the interests of the ratepayers, asked for a penalty. Mr. Seldon quoted several cases bearing out his contention that the Harmonic Retreat was a building within the meaning of the Act. Mr. Brede (clerk to the council) and Mr. Prouse (surveyor) having given evidence, Mr. Finch asked the bench to inspect the place. He argued that it was not a building within the meaning of the Act, but simply a marquee, which could be removed in two hours. That at once showed its temporary character. The council only had power over permanent buildings, as to their stability, air space, prevention of fire, and those with roofs and chimneys, showing they were meant for occupation. There was none of that in connection with the Harmonic Retreat. The Bench, having viewed the spot, were of opinion by a majority that the Harmonic Retreat was not a building within the meaning of the Act, and therefore dismissed the summons.

ARBITRATION AWARD AT IDLE, LEEDS.—Mr. John Hepper, of the firm of Messrs. Hepper and Sons, Leeds, auctioneers, has made his award as to the sum to be paid by the Idle Urban District Council to the Misses Crompton-Stansfield, of Esholt Hall, for the land adjoining the river Aire at Buck Mill, Thackley, which has been taken by the district council for the purpose of their sewage disposal works. The total area of the land to be acquired by the council is 14a. 24p.—12a. 2r. 16p. of land and 1a. 2r. 8p. of river-bed and goit. The amount claimed by the Misses Stansfield in their notice of claim was £4,000; but when before the arbitrators at Leeds, in July last, this claim was reduced by them to £3,542 10s., being £200 per acre for the land, and £100 per acre for half the river-bed and goit, plus 10 per cent. for compulsory purchase, and £600 for the consequential damages caused by the severance of this part of the estate from that adjoining. It was urged on behalf of the council at the arbitration that the price to be paid by them should not exceed £1,100. Mr. Hepper has awarded the Misses Stansfield £1,906, being £1,636 10s. less than the reduced sum claimed by them, and £806 more than the price contended for by the council.

IN RE C. W. KING, OF NEWCASTLE-ON-TYNE.—At the Newcastle Bankruptcy Court, last week, Chas. William King, contractor, came up for his first examination. Debtor's liabilities amounted to £3,403, and his assets were £5,042 8s. 8d. The debtor, a native of London, said he went to Dar-

lington in 1872. Until 1879 he was inspector of various public works. In 1879 he started building on his own account. The whole period of his active building covered four years from 1879 to 1883. He built houses at Gateshead, the Vegetable Market in Newcastle, the Corporation stables, the Sanatorium on the Quay, and new streets. From the result of these works he put £12,000 by in cash and unencumbered property. In 1883 he realised his property, retired, and went to live at Cheltenham. He lived on the rents coming from his houses; his income was from £300 to £400 a year. In 1894 he returned to Newcastle, the reason being that his sons were growing up, and one wanted to enter into business at Newcastle. His capital during the time he had been away from Newcastle had diminished. Practically his first loss was due to his having made himself responsible for the carrying out of a contract entered into by his old manager. He lost money on the transaction, amounting to between £2,000 to £3,000. He estimated the gross value of the property he had mortgaged at £8,700. The last important contract he had was the building of a board school in Newcastle. Prior to that he had the Gallowgate Baths, over which he lost something like £3,000. That was due to delays and the bad weather. He thought the contract price was a reasonable one. The school board price was £12,400, and the contract that was afterwards accepted was £2,000 more; but there were two good men below debtor in price, although debtor's was accepted. The examination was adjourned for a week.

IN RE E. S. GUNN, HARWICH.—At the Colchester Bankruptcy-court on Sept. 20th, Edwin Stephen Gunn, builder and contractor, residing and carrying on business at Fernlea-road, Harwich, came up for his public examination. The summary of the debtor's statement of affairs shows gross liabilities to the amount of £1,240 7s. 9d., of which £909 9s. 9d. is expected to rank as dividend, and there is a deficiency of £378 7s. 11d. The Official Receiver's observations are to the effect that debtor about 15 years ago executed a deed of assignment. The debtor asserted that he supposed he must have done work with inadequate profit, but he was not scholar enough to keep such books as were necessary to ascertain the profit and loss on various jobs. As far as the Official Receiver was able to judge, this appeared to be a case in which failure was due mainly to debtor's neglect to have his books posted up frequently. The Registrar declared the examination closed.

HEWING STONE IN THE STREETS.—George Cona-beer was summoned to the Guildhall police-court on Tuesday for hewing stone in Wood-street. The evidence of two constables showed that defendant chipped flag-stones on the pavement, and some chips, similar to those produced, flew about to the danger of the public, as defendant had not the screens up that his employers had provided him with. Mr. Vickery, solicitor, appeared for Messrs. Mowlem, the defendant's employers, and urged that, as contractors for the pavement repairs in the City, they were bound to do this work when notified of defects. All unnecessary chipping was avoided, and everything possible was done so as not to inconvenience the public. The City Police Act, under which defendant was summoned, did not say anything about screens. On this occasion screens had been provided, but had been taken down so that pedestrians could pass. Mr. Alderman Halse said Messrs. Mowlem did almost all they could to prevent accidents, but in this case their men had not kept the screens up they were provided with, and defendant would be fined 5s. and costs.

A technical school is about to be erected for the Llanberis School Board, from plans by Mr. R. G. Thomas, M.S.A., of Menai Bridge. The contractors are Messrs. E. Thorpe and Son, of Llandudno, whose tender, the lowest sent in, has been accepted at £2,617.

With regard to the proposed new lock below Putney, the combined committee representing the districts of Hammersmith, Fulham, Chiswick, Brentford, and Isleworth, on the Middlesex side of the river, and Putney, Barnes, and Mortlake on the Surrey side, are now considering a report which has been submitted to them by Mr. Pritchard, C.E., who says that the best position for the proposed sluices is a point by the river on the Middlesex shore from the Broomhouse, Dock-lane, to land directly opposite on the Wandsworth side, and about five miles below Putney Bridge. The cost of the works is approximately estimated at £250,000, and four years would be occupied in the construction. The combined committee have also received an independent report from Messrs. Stevenson and Burstal, engineers, Burstal, who recommend the erection of a lock and half-tide weir, either from Broomhouse Dock to the Osier Beds a little above the Wandle outlet, or, alternatively and preferably, just below the Wandle outlet. They add that, having consulted Messrs. Ransomes and Rapier, of Ipswich, who constructed the Richmond sluice, they estimate the cost at £180,000.

WATER SUPPLY AND SANITARY MATTERS.

CARLISLE WATER-SUPPLY.—The present water-supply of Carlisle has, by a high authority, been practically condemned. At present the water is taken from the river Eden, near the town, and pumped into a reservoir at Harbottle Hill, whence it gravitates to the houses. Three proposed schemes have been proposed by the Water Committee are three in number. One is a scheme to obtain a supply by gravitation from the river Gelt, about eleven miles from the city, which would yield 2½ million gallons daily, at a cost of £129,320. The second is a pumping scheme, by which the water would be pumped from the river Eden near Cotehouse Island, about ten miles above the present intake, at a cost of £90,599, if a daily supply of 2½ gallons were taken, or of £65,989 if a supply of one million 650,000 gallons a day were deemed sufficient. The third scheme contemplated the extension and improvement of the existing works to yield a daily supply of one million 650,000 gallons at a cost of £38,679. Mr. Eaton, C.E., Sheffield and Westminster, was called in to report, and he recommended the adoption of the scheme for the supply of water by gravitation from Gelsdale, which he estimated could be carried out for the sum of £120,000.

CLUBBIDEAN RESERVOIR.—This reservoir of the Edinburgh and District Water Trust, in the Pentland Hills, is at present empty. It is in the hands of Messrs. Young, contractors, undergoing repairs. There has been a leak through the embankment for several years, and though not of an alarming nature, it was recently decided to find out the cause of it, and make the embankment watertight before the good weather ended. In digging down where the water appeared at the tail of the embankment, it was found that the ground was of a very loose, rocky nature, with numerous fissures in the rock, and it was through these cracks that the water was making its way below the puddle wall. What will now be done will be to cut deeper than the old foundation of the puddle trench, and fill up the fissures with concrete and clay—a good supply of the latter material being found near the reservoir.

HEATH TOWN, WOLVERHAMPTON.—The formal opening of the new works in connection with Heath Town sewerage scheme took place on Saturday afternoon. The sewage is conveyed five miles from the district, and is there treated. The contract for the works is in the hands of Mr. H. Holloway, of Wolverhampton, whose tender amounted to between £11,000 and £12,000. Mr. R. E. W. Berrington, of Wolverhampton, is the engineer.

MAIDSTONE.—The outbreak of typhoid fever at Maidstone has assumed alarming proportions, the total number of cases exceeding a thousand, and so far there have been over thirty deaths. Such a widespread onset of the disease could have only one origin—namely, polluted water—and the borough authorities have accordingly turned their attention to the water supply, which is furnished by a private company. They have found that one of the springs at Tutsham, near Farleigh, was surrounded by land which had been poisoned by refuse, and the supply from that source will forthwith be stopped. It is stated that the town council only has the water supply tested once a quarter, and that the Water Company themselves not only have no periodic analysis of their supply, but have actually discontinued the use of their filters at Farleigh as an unnecessary expense. An inquiry into the causes of the epidemic was commenced by Dr. Theodore Thomson, from the Medical Department of the Local Government Board, on Wednesday.

MANCHESTER.—A meeting of owners and ratepayers of Manchester convened under the provisions of the Borough Funds Act was held on Friday evening in the Manchester Town Hall for the purpose of consenting or otherwise to the scheme of the Rivers Committee for dealing with the sewage effluent by conveying it, by means of a culvert, into the Mersey. The Lord Mayor presided, and submitted a formal resolution giving consent to the scheme, and authorising the corporation to take the steps necessary for carrying it into effect. Mr. Alderman Thompson, chairman of the Rivers Committee, seconded the motion, and explained the position of the committee in the matter. Dr. Pankhurst and other speakers opposed the motion on the ground that the present system of purifying the effluent had not had a fair trial, and on a vote being taken, the motion was defeated by a large majority. The Lord Mayor and other members of the city council demanded a poll, which, it is understood, will be taken as early as possible.

An interesting ceremony in connection with the ancient grammar school at Ludlow took place on Tuesday week, when the building was formally reopened after being renovated and enlarged at a cost of about £1,500. The work was carried out by Mr. J. Thompson, of Peterborough. The school now affords accommodation for a larger number of boys than hitherto.

Our Office Table.

NEWCASTLE-ON-TYNE is one of the few large cities which hitherto has possessed no art gallery, but a committee of the corporation have just unanimously adopted a report, which, if agreed to by the council, will remove that defect. The proposal, originated by Mr. Harkus, is to utilise as a gallery the upper floor of the building already in existence in Elswick Park, the lower portion of which contains the Lough collection of sculpture. The rooms are well lighted, and would provide a space of from 65ft. by 35ft. The only objection to the scheme is that the site is a considerable distance from the centre of the city. Already promises have been made by several well-known local gentlemen to present the committee with a number of valuable pictures for the benefit of the public, and no doubt a liberal response will be made by others to an appeal for further aid in this particular direction. A report will be presented to the city council at its next meeting to carry the proposal into effect.

The final meeting of the shareholders of the Tower Subway Company was held on Thursday in last week, at 21, Great George-street, Westminster. The company was formed in 1868, and, in addition to the ordinary capital of £12,000, the sum of £7,830 was raised by preference shares and £6,600 borrowed on mortgage debentures. The Tower Bridge having injuriously affected the tolls of the company, the Corporation was called upon to pay compensation. This was fixed by the arbitrator at £11,500. The mortgage debentures and other debts have now been paid, and the subway sold to the London Hydraulic Power Company for £3,000. The object of the meeting was to distribute the money in hand to the shareholders. The balance in hand was stated to be £5,927 0s. 6d., and the directors recommended the distribution of £5,250, being at the rate of 5s. 3d. in the pound. The directors were also rewarded £100 each for their trouble in fighting the case with the City and effecting the sale.

The annual statement of the Dean of Guild for Glasgow, which has just been published, shows that the past year has been one of great activity in the building trade in that city—the busiest, indeed, since 1875-76. In two-roomed houses particularly there has been an exceptional boom, over 2,750 tenements of these having been put up in twelve months. Probably the most impressive fact in Dean of Guild Graham's statement is that the value of the buildings authorised during the year was £1,851,005—an increase of no less than £560,000 over last year, and £830,000 more than the average of the last ten years. Glasgow seems, indeed, to be on the crest of a wave of building speculation somewhat similar to that of 1872-77, which was succeeded by a depression that found its lowest point in 1881.

In June last Sir Benjamin Stone, M.P., inaugurated a movement for the collection and preservation of photographic records of all objects and scenes of interest in the British Isles. The idea was to follow the example set by Birmingham, and to establish a National Photographic Record Association. A committee was appointed to prepare rules and by-laws, and generally to arrange the constitution of the association. A meeting of the executive was held on Wednesday afternoon in the rooms of the National Photographic Association, 12, Hanover-square, when Sir Benjamin Stone, M.P., who took the chair, explained the objects of the society. He said that their intention was to deposit the photographs, with explanatory notes, in the British Museum, where they would be accessible to the public under proper regulations. The society was practically launched. He moved a resolution to the effect that application be made through the proper channel for the permission of Her Majesty to allow her name to appear as the patron of the association. This was seconded by Sir E. Maunde Thompson and carried unanimously. The rules having been approved, on the proposition of Mr. Ralph Neville, F.S.A., F.R.I.B.A., seconded by Mr. C. E. Fagan, Sir Benjamin Stone was elected first president of the society, and a council was appointed. The meeting expressed its desire to work in harmony with provincial societies, to whom they would be willing to loan selections of photographs. A series of 100 photographs taken by the president in the Houses of Parliament was accepted as a nucleus of a collection.

In connection with the Church Congress, now

being held at Nottingham, the 19th annual Ecclesiastical and Educational Art Exhibition was opened on Monday night by the Mayor (Mr. Alderman Fraser). The exhibition is held in a wooden building, erected for the purpose on a plot of ground adjoining the Guildhall, and which had been placed at the disposal of the executive by the Corporation. As on previous occasions, the exhibition is divided into two sections—the trade or general division and the loan collection. In the trade division are examples of the manufactures of the leading ecclesiastical and educational firms from all parts of the country, and the loan collection includes more than 400 exhibits, including chalices, in which the exhibition is very rich, reliquaries, embroidery, patens, medals, seals, manuscripts, and early books and engravings. The Bishop of the Diocese leads with his pastoral staff and cope. The Southwell Cathedral plate is also on exhibition, and the Corporation of Nottingham have lent their regalia and plate.

APPROPOS of the discussion which has arisen in Dublin concerning the importation from England of a peal of bells for St. Patrick's Cathedral in that city, Mr. R. M. Butler, M.R.I.A., a Dublin architect, writes that the custom of calling in English architects to design buildings in Ireland, to the detriment of Irish practitioners, prevails to a surprising extent. At the present time, he points out, the following works are now in progress under English architects:—Messrs. Power and Son's distillery (Mr. W. D. Caröe, architect to the Ecclesiastical Commissioners, London); Mr. John Jameson—residence at Howth (Mr. Darbyshire, Manchester); Lord Carysfort—church at Arklow, cost over £25,000 (Sir A. W. Blomfield, London); Lord Iveagh—residence, Farnleigh, Castleknock, and St. Stephen's Green (Mr. Wm. Young, London); new hotel, Sackville-street (English architect); Kilkenny Cathedral (Sir A. W. Blomfield, London).

At the annual meeting of the Cumberland and Westmoreland Antiquarian and Archaeological Society, held at Penrith on Friday, Chancellor Ferguson gave an account of the work done at Furness Abbey during September, under the superintendence of himself and Mr. W. H. St. John Hope. The foundations of the buildings round the cloister garth had been uncovered, and carefully planned and measured, and it became apparent that the refectory or frater had been pulled down, and two new ones erected side by side. This was done to evade the statute, which directed that Cistercians were not to eat meat in the frater. So they built two. In one, the "lean frater," they had no meat, but on three days in the week they dined on meat in the "fat frater." The kitchens and other domestic offices were also examined and measured. A discovery was made about the church—that the Cistercians rebuilt it at an early date, using the old ashlar work over again; hence stones with mason marks of the Norman time were found in Perpendicular work. This should, Mr. Ferguson thought, be a caution to archaeologists not to be too confident in dating a building by the mason marks on it, nor in speculating about families of masons with hereditary mason marks. Some unknown rooms were discovered at the abbey, but more work has still to be done.

In our account of the Theatre-planning and Construction Section of the Victorian Era Exhibition, Earl's Court, last week, we referred to a model fire-resisting curtain, shown by the United Asbestos Company, Limited, as being Messrs. Clarke's patent, and constructed by Messrs. Clark, Burnett, and Co. for the Lyric Theatre. This was rather a stupid mistake. The curtain was an invention of Mr. E. Bull, architect, of Manchester, and Mr. J. Alfred Fisher, the manager of the United Asbestos Company, Limited. The curtain stood a practical test of fire successfully in the Queen's Theatre, Manchester, on August 17, 1890, when, although the whole of the auditorium was destroyed, the stage and properties thereon were preserved intact.

Mr. A. M. Kinnison, assistant surveyor of main roads for the Leek District of the Staffs C.C., has been appointed surveyor to the Leek Rural District Council out of a large number of applicants.

At the last meeting of the Urban District Council of Rushden (Northants) Mr. W. B. Madin, C.E., who for the past eight years has held the office of assistant town surveyor and water engineer of Leek, was appointed surveyor out of a large number of applicants.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Engineers. "Filter Presses for Sewage and Sludge," by James Croll. Royal United Service Institution. 7.30 p.m.
Liverpool Architectural Society. Opening Address by the President, W. E. Willink, M.A., A.R.I.B.A. 6 p.m.

WEDNESDAY.—Edinburgh Architectural Society. President's Address. Dowell's Rooms, George-street, Edinburgh. 8 p.m.

FRIDAY.—The Architectural Association. Inaugural Address and Distribution of Prizes by Hampden W. Pratt, F.R.I.B.A., President. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

OCTOBER 8th, ANNUAL GENERAL MEETING, 9, Conduit-street, W. 7.30 p.m. Distribution of Prizes. Address by the President. Mr. HAMPDEN W. PRATT. Exhibition of Prize Drawings and Students' Work.

E. HOWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

THE SURVEYORS' INSTITUTION

(INCORPORATED BY ROYAL CHARTER).

Temporary Address—

SAVOY STREET, VICTORIA EMBANKMENT, W.C.

EXAMINATIONS, 1898.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of students will be held on the 19th and 20th of JANUARY NEXT.

It is proposed to examine Candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland, and Northumberland, at Manchester. Candidates from other counties in England and Wales will be examined in London.

Irish Candidates will be examined in Dublin.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers, and Building Surveyors (held under the provisions of the Charter), qualifying for the Fellowship and Associateship of the Institution, will commence on the 21st of MARCH NEXT.

English Candidates for the Professional Examinations will be examined in London.

Irish Candidates will be examined in Dublin.

Particulars as to subjects, course of examination, prizes, scholarships can be obtained of the Secretary.

All applications for the Professional Examinations, Divs. II., III., IV., and V., must be sent in before the 31st of OCTOBER, and applications for the Students' Preliminary Examination before the 30th of NOVEMBER. The necessary Entry Forms for the various Examinations can be obtained of the Secretary.

Sir Philip Magnus will, on Monday evening next, distribute the prizes and certificates to the students of the plumbing trade classes at the Polytechnic, Regent-street.

The President of the Board of Trade, when laying the foundation-stone of the Passmore Edwards Public Library, St. George's in the East, on Wednesday, referred to the progress made in recent years in providing the East-end with institutions for the instruction and recreation of the people, and said that, out of the eighty parishes into which London is divided, from fifty to sixty had adopted the Public Libraries Act. The library, which has been built from designs by Mr. Maurice B. Adams, F.R.I.B.A., was illustrated in our last issue.

Colonel W. L. Coke, M.Inst.C.E., one of the Local Government Board Inspectors, held an inquiry at Leicester, on Tuesday, into an application of the town council to borrow £30,200 for a new public park, £33,719 for the extension of its electric lighting plant, and £1,200 for a branch free library.

The Dean and Chapter of St. Paul's Cathedral have selected a position in the central nave, near the north-west quarter-arch of the dome, which is now being prepared for the reception of the noble picture of "Time, Death, and Judgment," the generous gift of the artist, Mr. G. F. Watts, R.A.

The Leith Corporation on Tuesday elected Mr. W. A. Bryson, consulting engineer of Glasgow, as electrical engineer, at a salary of £300 a year. There were 22 candidates for the appointment.

At Wednesday's meeting of the Halifax Chamber of Commerce, the President announced that the Midland Railway Company would next Session proceed for a Bill to connect their line with Huddersfield and Halifax, but would not at present go further north.

The Canadian Government is inviting artists to send competitive models of a Jubilee statue of the Queen, to be erected on the Parliament terrace at Ottawa, and also of a statue of Alexander Mackenzie, the first Liberal Premier of the Dominion.

The Duke of Devonshire will lay the foundation-stone of the Jubilee Memorial Chapel, in connection with Giggleswick School, Yorkshire, on Thursday in next week.

At the quarterly meeting of the Court of the Worshipful Company of Plumbers, held at the Guildhall on Wednesday, Alderman Richard Hind was sworn into the office of Master, Mr. Frederick Machin to that of Warden, and Mr. Charles Hudson to that of Renter Warden for the ensuing year.

An agreement has been made between the Great Western Railway, the London County Council, and the Paddington Vestry as to the arrangements for reconstructing and widening, at a cost of £17,000, the railway bridge and the approaches at Westbourne Park. The thoroughfare is to be 50ft. wide between the pavements.

Trade News.

WAGES MOVEMENTS.

EAST LANCASHIRE MASONS' AND PLASTERERS' STRIKE.—An important correspondence has been passing between the masters and workmen in order to bring about a settlement of this strike, which has been going on since May. An offer of arbitration on the part of the masters has been repudiated by the men, who demand an advance of from 8d. to 9d. per hour.

LEEDS.—Three months ago the plasterers' labourers employed in Leeds gave notice of their intention to demand an advance of 1d. per hour on the present rate of wages, making it 7d. per hour. A deputation from the men had an interview last week with the masters, who offered 1d. advance. This the men declined. The masters have conceded 7d., and the advanced rate came into force on Saturday last. Considering the contracts in hand, some extending over more than two years, the masters urged the shortness of the notice; but, as stated, they had to yield.

NELSON, LANCs.—On Saturday all the operative plumbers in Nelson came out on strike, consequent upon the masters refusing to grant an advance of from 8d. to 9d. per hour, in pursuance of notice served six months ago, which terminated on Friday evening.

CHIPS.

In the York Consistory Court, held in the Minster on Thursday in last week, before the Rev. W. Haworth, acting as Surrogate, faculties were decreed to vicars and churchwardens as under:—Levisham, to extend the clergy and choir vestries, and to make other alterations; Swinton, to rebuild the church, which was destroyed by fire on the 24th of March, 1897; Sherburn-in-Elmet, to affix two additional bells in the tower; Carlton, to fix a clock over the porch; Bramham, to insert a stained-glass window in the church, in memory of the late Mr. George Lane Fox.

Henry Pumphrey, foreman at Whitley Brick-works, near Tynemouth, was cleaning some machinery on Thursday in last week when his neckerchief, which was tied in a slip knot, caught in the cog-wheels, and the noose was tightened so quickly that he was strangled before any assistance could be rendered.

The poll decided on by a majority of eight to six at the last meeting of the town council of Launceston on the question of the site for Mr. J. Passmore Edwards' generous gift took place on Wednesday at the Guildhall. At 8.30 the mayor declared the result of the poll to be as follows:—For Westgate, 111; for Northgate, 369—majority for Northgate site, 258.

The fire at Ravenstone, Bucks, although a bad one, was not so calamitous as was at first reported. It resulted in the destruction of seven cottages, one house slightly larger, and several farm buildings. The number of persons burnt out of their homes was only 26, and, as several houses in the village are unoccupied, there was little difficulty in finding accommodation for them all. The damage to houses, furniture, barns, and farm produce can scarcely be as much as £1,200, about half of which is covered by insurance.

A special meeting of the town council will be held on Tuesday next, to consider a report presented by the Docks Committee, embodying plans and estimates for the proposed new docks, and other works at Avonmouth. The estimated cost of the works proposed is about £1,550,000. It is proposed to construct a new dock of over forty acres in extent, giving upwards of 5,000ft. of quay space, with an exceptionally wide entrance lock. Then there is to be a large graving dock, granary and shedding will have to be erected, and the works will also include a landing stage, with railway connections with both docks.

In February, 1896, the Church of St. Paul, which Sir Charles Seeley has built for the new parish of Daybrook, was consecrated by the Bishop of Southwell. Since then, however, important additions have been made, notably a tower and spire, 150ft. in height, and an octave of bells. The temporary font and pulpit have also been replaced by others in harmony with the beauty of the church. On Saturday week the new font, pulpit, and bells were dedicated by the Bishop of Derby. The font is of white Mansfield stone with marble shafts. The basin, heptagonal in shape, is carved and traceried. At the angles are a series of canopied figures representing Truth, Faith, Hope, Charity, Courage, Industry, and Purity. Both in regard to the material used and the style of workmanship the pulpit corresponds with the font. The panels contain carved groups depicting the Saviour, St. Paul, and John the Baptist preaching. The canopied figures at the angles are St. James, St. John, St. Peter, and St. Paul.

A meeting was held on Friday of the sub-committee of the Lord Provost's Committee of the Edinburgh Town Council appointed "to consider and report as to the completion of the North Bridge-street improvement scheme, and whether the scheduled area should be exposed for sale in one lot, or in lots of convenient size, or if, under the circumstances, it is expedient for the corporation to undertake the rebuilding of that area in whole or part; also to report if any alterations are necessary on the plans approved by the magistrates and council." Opinion was sharply divided as between the council undertaking the rebuilding of the street—a course which was advocated by the treasurer—and the proposal to put the area up for sale in blocks, which was advocated by the Lord Provost. Nothing was decided, and the meeting was adjourned.

On Wednesday week the foundation-stones of new hand-made paper mills at Bersham, near Wrexham, were laid by Mrs. Kenyon. The mill is to cost about £4,000, exclusive of machinery.

At the board-room of the Foleshill Workhouse, on Friday, Dr. R. J. Reece, Local Government Board Inspector, held an inquiry into the proposal by the Foleshill Rural District Council to borrow £5,790 for the purchase of land and the erection of an infectious hospital for the Union. Mr. T. F. Tickner, architect, produced the plans of the proposed building, the site of which is in Church-lane, Little Heath, between the canal-bridge and the church. The hospital would be divided into an administration block, isolation block, ward block, and laundry block; and the building would be three stories high. There would be 18 beds, but accommodation could, on emergency, be provided for 20 or 24 cases at one time, and for three different kinds of diseases in patients of both sexes.

The announcements of dissolutions of partnerships in Friday's *Gazette* include L. Lewis and T. D. Williams, builders' merchants, Liverpool and Liscaud, under the style of Lewis, Williams, and Co.; S. W. S. Saunders and C. D. Newton, road, sewer, and general contractors, Bournemouth and Southampton, under the style of W. H. Saunders and Co.; and E. J. Harland and J. D. W. Ashton, brick merchants, Bexley, under the style of Harland and Ashton.

After a general debate lasting three days, the Swiss National Council adopted on Friday by one hundred and twelve votes against twenty-one, the preamble of the Bill for the purchase of the railways by the State.

On Friday afternoon, while William Hillman, 20 years of age, a joiner, was fixing a bracket on the grand stand at New Brighton Tower Grounds, the scaffold upon which he was standing gave way, owing to the force of the wind, and he fell to the ground, a distance of 60ft. The unfortunate man was killed on the spot. This is the seventh death in connection with the works.

The life-size marble statue of the late Judge Thomas Hughes, which is to be erected at Rugby by old Rugbeians and others, has been intrusted for execution to Mr. T. Brook, R.A., who will carry out the work forthwith. Towards this object over £1,200 has been subscribed, and any further donations that may be received will be devoted to the Boys' Clubs which have been established both in London and Birmingham in connection with the Rugby School Mission.

A fire broke out early on Saturday morning in the saw mill of Messrs. Astell Brothers, who have an extensive wood-yard at a spot near where the Midland and London and North-Western lines cross at Bedford. The place was completely burned out, and several valuable machines were destroyed, while the engine was damaged and the large flywheel was cracked.

Mr. Herbert Ford, F.R.I.B.A., of 21, Alderman-bury, has taken into partnership Mr. H. L. Ford (his son) and Mr. W. J. Burrows (his chief assistant). The firm will trade as Ford, Son, and Burrows.

The Lachine rapids, near Montreal, have been successfully utilised for the production of electricity by a company of local capitalists. The formal opening of the new works took place on Saturday. From 20,000 to 25,000 horse-power is procured at a cost of nearly 2,000,000dols., and furnishes electricity for lighting and motive purposes to Montreal and the adjacent municipalities.

The foundation-stones of a new Wesleyan chapel and Sunday-school were laid at Castleton, Derbyshire, on Friday. The cost will be about £1,500.

Colonel A. G. Durnford, R.E., an Inspector of the Local Government Board, attended in the council chamber, Town Hall, Ipswich, on Thursday in last week, to hold an inquiry in reference to an application by the town council, as local sanitary authority, for permission to borrow £4,600 for completing the works of sewerage, in accordance with plans prepared by the borough surveyor (Mr. E. Buckham), who gave evidence as to the scheme.

LIST OF COMPETITIONS OPEN.

Leeds—Wholesale Dead Meat Market and Abattoir	£100 (merged), £50, £25	John Harrison, Town Clerk, Municipal Buildings, Leeds	Oct. 8
Dorking—Workhouse Infirmary (65 beds, £1,000 limit)	(No first) £15, £5	Gao. Soales, Clerk, High-street Dorking	" 13
Pickering & Kirbymoorside—Gravitation Water-Supply Scheme	No Premium	Robert Kitching, Clerk to Pickering R.D.C., Pickering	" 16
Colne—Technical School, Free Library, and Public Hall (£5,500 limit)	£50, £35	Alfred Varley, Town Clerk, Town Hall, Colne, Lancs	" 20
Wolverhampton—Free Library (selected Architects)		The Town Clerk, Wolverhampton	" 28
Eastcote and Northwood, near Ruislip—Sewerage Scheme	£10 for Combined Scheme, £15 for Eastcote, and £25 for Northwood. No premium offered; no Assessor named	C. Woodbridge, Clerk, R.D.C., 33, High-street, Uxbridge	" 30
Southend—St. Alban's District Church	15,000 dol. M-x	Rev. E. C. Kimber, Avenue-terrace, Southend-on-Sea	Nov. 20
Mexico—Legislature Palace (1,500,000dol. limit)		Secretary Public Works, Mexico City	" 30
Cardiff—Town Hall and Law Courts (A. Waterhouse, R.A., Assessor—£200,000 limit)	£500 (merged), £300, £250	J. L. Wheatley, Town Clerk, Town Hall, Cardiff	Dec. 4
Nottingham—Laying-out and Planting Basford New Cemetery	£100, £50	Samuel G. Johnson, Town Clerk, Nottingham	" 15
Nottingham—Designs for Basford Cemetery Buildings: Chapels, Crematorium, Lodges, &c.	£100, £50	Samuel G. Johnson, Town Clerk, Nottingham	" 15

CHIPS.

The new reservoir just constructed for the Cardiff town council at Taff Vavr, was formally opened yesterday (Thursday) by the chairman of the water-works committee.

The centenary of Donizetti, the composer, was celebrated at Bergamo, on Sunday, by the unveiling of the statue of the musician, carved by the Neapolitan sculptor, Signor Jerrace.

A convocation in connection with Durham University was held at the College of Science, Newcastle-on-Tyne, on Saturday, when the honorary degrees of Doctor of Literature was conferred on Miss Jane Ellen Harrison, the well-known student of classical archaeology and interpreted Greek art. Miss Harrison, who has previously received the degree of LL.D. from Aberdeen, is the first lady recipient of an honour from Durham University.

The Poet Laureate has consented to open the new Science and Art School at Ashford, on Wednesday week, the 13th of October.

Mr. T. J. Rastrick, the oldest architect in Hamilton, Ont., died on Sept. 13. He was of English birth, and was educated as a civil engineer.

It was remitted to Mr. Morham, the Edinburgh City Superintendent, by the plans and works committee of the town council on Friday, to obtain estimates for the erection of the new baths at Glenogle-road, Edinburgh.

The Cumberland and Westmoreland Antiquarian and Archaeological Society held their second meeting of the season on Friday and Saturday. They assembled at Penrith on Friday, and the programme included a visit to Edenhall, Langwathley, the Long Meg stone circle, and the Parks tumulus at Kirkoswald.

In the list of adjudications in bankruptcy in Tuesday's *London Gazette*, the name appears of John Ebenezer Lash, of Ruabon and Wrexham, architect and surveyor.

A new Presbyterian church in Gordon-road, South Byker, was opened on Sunday. It has been built from plans by Messrs. Badenoch and Bruce, of Newcastle-on-Tyne.

At the London Mansion House, on Friday, Walter Thomas Hooker, a builder, of Shirley, Southampton, was committed for trial upon a charge of libelling Sir Walter Prideaux, solicitor to the Goldsmiths' Company. Bail was refused.

The Sanderson memorial window which has been placed in the Trinity Presbyterian Church, Northumberland-road, Newcastle, was unveiled on Friday. The artists are Messrs. Atkinson Bros., of Newcastle-on-Tyne.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2231.

FRIDAY, OCTOBER 8, 1897.

IMITATION AND IMITATORS.

IT has been said that "Imitation is the sincerest form of flattery," and in this view and spirit we must regard a great many of the noble works which have been bequeathed to us, whether in architecture or painting. Have not the Romans left us examples of their admiration of Greek design in edifices which to this day are models of Classical taste? Are not the "Orders" themselves and their application to the more varied purposes of Roman civilisation proof of the admiration they held for Greek architecture? Was not the peristyle a Greek form which those daring adapters made their own? Though they borrowed also largely from the Etruscans, and combined the arch and vault with Greek forms, nevertheless no one can deny that they were, to as large an extent as their local circumstances permitted, imitators of the Greeks. Turning to Mediæval times, the builders of our cathedrals and churches closely followed their predecessors—not, indeed, slavishly, but with sufficient closeness not to be regarded as innovators. Contemporary works abound in which the same details and methods are used, even though the craftsmen were not the same. During the period of the Renaissance we find the most illustrious men copying what they conceived to be worthy of imitation. In all these instances a spirit of reverence for the past prompted the imitator; he knew very well if he set aside all that was good belonging to his predecessors, and relied solely on his own skill and ideas, he would be taunted as an eccentric or innovator, without being able to prove the superiority of his design; for, after all, there is a good deal of the egotist in the man who dares to place his own creation before the world, when there are better examples at hand. We are not contending for a slavish adherence to precedent when a departure is called for. For instance, an architect sees a façade he likes; but it would be bad imitation for him to appropriate it bodily or in part, windows and all. A technical school or new baths, for which no authority can be found, could hardly justify an architect in copying Mr. So-and-so's elevation of a building for another use. It would hardly be flattering to the original designer, who had thought he had produced something appropriate. Many bad imitations will occur to anyone who has observed contemporary works. They are always without a meaning, such as taking a feature and grafting it on a totally different building; for example, a church tower or cupola, or an entrance. Mr. Jerryman copies one of Norman Shaw's bay windows in his new villa, which may be in a very commonplace style, or a fireplace treatment suitable only for brick and stone in an ordinary dwelling. A good imitation reflects credit on both the original artist and adapter; but then it is not always the most literal. The good imitation discovers some adaptable feature and makes it its own; some motive that strikes the artist as being appropriate. If we apply this test to the general run of copies, we soon find out where they disappoint us. The feature is taken without the meaning; the style is imitated without any reference to the adaptability of the building; we even find the eccentricities and irregularities of the artist copied. The bad imitation thus discredits itself and its producer, and always tends to satirise the original by pointing rather to its defects and weaknesses.

In the good sense of the term all our best architecture may be included, even as we have said, those developments which we are accustomed to regard as original. Imitation in the right sense has always been going on; but since the 16th century the tendency has been more to copy buildings than to imitate the methods of their builders. We may see glaring cases of this during the Gothic and Classic revivals, when replicas of ancient buildings were produced; and this sort of reproduction has been going on to our own day, but with more knowledge. We know, for example, that the "Gothicist" of those pseudo days thought nothing of copying a pointed window, tracery and all, from Salisbury or Lincoln for his client's residence, without any idea of the different uses of the two buildings. A buttress was introduced where it was not wanted simply for ornament, and bosses, pinnacles, and gargoyles placed anywhere. Then we notice they were reproduced, not by the old, but by new, imperfect methods. They were often in brick, plastered over, and the bosses and carvings were cast in cement. Even a Gothic arch or a quoin or a pointed window was constructed in quite a modern fashion, with regular courses of uniform size; and it was not till the "sixties" that the modern architect and mason began to find out the Mediæval methods of construction.

In the best imitations it is difficult to discover where the influence of tradition ends and copying begins. Take any of our great buildings, St. Paul's Cathedral, the Houses of Parliament, or the Law Courts. Wren had the works of the great Cinque Centists before him, but no one can say that he copied any great building, except to take his inspiration from St. Peter's, at Rome. The two edifices are quite unlike. Externally the great work of Michael Angelo has only one order and an attic, that of St. Paul's two. If Wren had followed St. Peter's in this, he would have avoided his sham screen walls which inclose nothing over the real aisles; and if he had taken the great Roman example as a guide, he would have also avoided the other great sham of an outer timber and leaden dome, and the lantern would have been real, supported by the dome, and would have added to the interior effect instead of being merely an ornament. But we can admire the general proportions externally, while admitting the superiority of St. Peter's as a great construction. Nor will any one assert that the Houses of Parliament is a copy of any building. Though its exterior is covered with details and ornament, derived from 15th and 16th century examples, the architect has shown boldness and adaptation. We have imitations of other building. In Pall Mall, clubhouses are to be seen which reproduce features from the Farnese Palace, and Library of St. Marks, at Venice, with more or less success. The Louvre and the Pantheon, at Paris, are inspired from Italian examples, and these have been reproduced in many modern buildings, though no one can say how much of either is a copy and how much original. Again the Renaissance of Italy, France, and Belgium have supplied models for most of our recent buildings. No one can deny to those countries an influence in the design of our best works. If we take leading Gothic buildings, we shall find the same principle at work. Many of the works of Scott are studious imitations of 13th-century buildings—if it had not been for his genius they would have been mere copies; but he made them his own. An old proverb says: "One man may steal a horse out of a field, but another may not look over the hedge," and this is very true about those who imitate. "Genius borrows nobly." The artist of genius can appropriate; but he who does so without that gift only merits the

name of pirate. The lesson is worth remembering. And has not one of our best modern essayists said that "Next to the originator of a good sentence is the first quoter of it"? It has been said that Shakespeare was more original than the authors he quoted; and may we not say the same of every artist who has made his own the traditions of his craft? In the hands of a master the elements of any style are combined or modified in such a manner that a new result is attained. Have we not seen well-known Gothic precedents and details made to assume new form and life in the hands of a Pugin, a Sedding, a Pearson, or a Bentley? Few can trace back to their original sources the combinations and forms of beauty found in the works of these masters, whether it be only a piece of tower design, or the design of a font or a piece of furniture or ironwork; and yet the germs may all be found in a few old buildings or Mediæval examples.

Architects practise several sorts of imitation. Some take ancient models, others modern ones. There is always a fascination in taking old work; but the danger is that we imitate those portions which are the least adapted to our present wants. It may be an entrance of an old house, or a gable end of some baronial hall. We engraft it in a modern house built possibly of a different material; we lose all sense of proportion and harmony; the appropriations look out of place with the rest of the new work. Our designs are "shreds and patches." The gifted architect pursues another course. He takes an old manor or hall which he has studied carefully in plan and detail, and he designs his new work as far as possible on these old lines; but it is not a patchwork—he takes the motive of the original or some portion of it. He probably knows several old houses of the period, and he is able to adopt their spirit without closely copying any one feature. He knows how to generalise from the study of a particular period or style, and that is just what the mere cribber cannot do. Men who have made their mark in any particular field of design are generally zealous students of traditional treatment. They are the last to rely on unaided thought. On this ground the imitator takes his stand: he knows he cannot go wrong if he understands the various ways the great men of previous ages have worked. Not that he follows any one, but it puts him in a position of forming an opinion. The designers of the best periods of our furniture, for example, were all men of this kind; they had learned the elements of their craft from a study of their predecessors' work. Thus, our Chippendales, Hepplewhites, Sheratons, and their contemporaries were men who had studied 16th and 17th century traditions, Flemish and French influences. These designers of furniture were greatly indebted to the decorative interior plaster-work of the Brothers Adam, of the woodwork of the Louis Quatorze period, and even of the carved stonework of the buildings. Such men as Vanbrugh, James Gibbs, and William Kent derived all their inspiration from the early revivalists of Classicism, Inigo Jones and Wren;—as they, in their turn, became the authorities on all matters of architecture and decoration in the last century. Yet we cannot say that Chippendale's designs or those of Sheraton's were mere tame reproductions. They infused their own taste into their work, and produced furniture at once graceful and refined. So, in the same sense, we can take any number of modern designers of ornament who have followed the traditions of Classic, Mediæval, Renaissance, Chinese, Persian, or Japanese ornament, who, by mastering the principles of one or other of these styles, have been able to give us designs for wall-papers, curtains, ceilings, and other fabrics worthy of the past. In

short, we have tried to indicate the work of one class of imitators—those who bring to their task judgment and a sound knowledge of traditional treatment; but imitators are made up of other kinds as well. We have those who design who have no knowledge of the traditions of their art, and who depend more or less on modern examples. They base their designs on works by architects more or less eminent in their profession, and are not over-desirous of going to the original. They are second-hand imitators; but perhaps they do better at this than venture on their own or any unbeaten paths. They find safety in following. But there is a third class of men who, while they would reject with indignation the term “imitator,” have been unconsciously, it may be, imitating all their lives. Their lack of reverence for the past, their claim to be original, and their desire for independence of all tradition, have served to give their works in a few instances an interest; but despite all they say, their designs evince as close an observance of style and precedent as any of their compeers. Then we have the ignorant imitator—the man who has no judgment or discrimination; but of this class we need not speak. It is sufficient for our purpose to show that in the majority of instances of design and craftsmanship imitative processes are commonly found, and that in the best works the authors have followed a law of observing points of agreement and similitude in the works of others. Under the lowest conditions—“Inferior eyes that borrow their behaviour from the great”—imitation may be better than novelty.

PROFESSIONAL INSTRUCTION.

THE irreducible minimum of knowledge necessary for those who practise architecture has been rather obscured by the attempts to raise the qualifications of its members. Instead of teaching a few things well, authorities on professional education have been tempted to put before the student a large number of subjects more or less allied to the calling of architects, for which only a superficial knowledge can be expected. This attempt to raise the qualifications of the architect has rather defeated itself by keeping a large number of students back from an ordeal they are not willing to undergo. Imagine an architect's pupil attempting to become proficient in such varied and opposite sciences as chemistry, mathematics, physics, and geology by a course of lectures, to be followed by another course treating of building construction, and the various trades and arts of which it is composed. No doubt an intelligent youth will acquire a general smattering of these subjects, but of what practical use or application is a question of doubt. If they are gone through before he enters an architect's office, it is ten chances to one that he will quickly forget all he has learned by the time his term expires, and that during his pupilage he will relieve his mind of all his school training. Is it at all probable that a pupil will trouble his head about the mathematical principles involved in a piece of construction he may be engaged on, or that he will be able to apply his mechanical learning to the stresses of a roof or the equilibrium of an arch, &c. It is very doubtful whether he retains in his memory the rules he learned respecting the composition and resolution of forces, and the application of those principles to practical building. Does he remember the principle of “moments” sufficiently to be able to put them to any account? How far, too, does his knowledge of geology come to his aid when he is visiting any building?—or his chemistry smattering help him in his study of the solvent properties of acids on stone? It seems to us much of the practical value of this pre-pupilage training is almost

lost, except, indeed, as a discipline, and all educational methods are valuable as disciplinary. In fact, school or college training can give all that is necessary in a general academical sense. Far better to postpone the professional course till the actual time of pupilage, and the second year of the term seems to be an appropriate time for the pupil to begin a course of instruction on these subjects, so that they may be carried on concurrently with his practical office work. If this could be managed agreeably to the master, and without overtaxing the pupil, what a gain it would be to the student, for the course of studies could be so arranged that it would help the student just when he is beginning to pick up his facts and experience. He wants to know, for instance, why walls of brick are made of certain thicknesses, generally by additions of half-a-brick; what bond is; why footings are formed as they are; how concrete and mortar are made. At that very time he would learn the *rationale* of the whole thing. Natural doubts as to the composition of brick, the varieties of stone, the qualities of timber, would speedily be set at rest by lectures on these subjects, which no master could afford to give himself. As he advances in his office experience, he wants to know why this and that is done? why roofs and partitions should be framed as they are? and a hundred other questions of a constructive kind will suggest themselves for solution. At this juncture the pupil will begin to feel a real interest in discovering the reasons why and wherefore. He will find his progress wonderfully assisted by the alternate aids of the drawing desk at office, and the classroom lecture or demonstration; by having to draw the construction to scale, and hearing the theory explained. Thus, theory and practice will go on hand in hand, and the mathematical demonstration will, having something practical associated, be more clearly understood and remembered than if given as a school subject months or years before the practical exemplification appears.

But it may be asked, what ought the minimum of attainments to be? We answer, just sufficient mathematics to enable the student to work out a formula, or to solve equations on structural questions; just enough mechanics to enable the student to determine the stresses of a structure of stone, timber, or iron. Sufficient geological knowledge may be given to enable the pupil who has any curiosity to find for himself to what particular stratum or formation a particular stone belongs, and from what bed it has been obtained, and to know the varieties and properties of the great limestones and sandstones of his country, at least. To expect a young man who has a dozen or more very important and practical subjects to take up and become familiar with in a short period, to know more, is to expect him to do an impossible thing. Of what immediate use, for instance, would it be to question him on the specific gravity and chemical constituents of any of the Plutonic rocks or greenstones, or in what strata the serpentine rocks of Canada are to be met with, in what series, or in what group. It will be enough if he knows sufficient mineralogy or chemistry to enable him to describe the mineral character, the specific gravity, the percentage of silica, lime, and other properties and durability of stones which are in use every day. In physics, ventilation, heating, and sanitary science he ought to know sufficient to enable him to understand all that is necessary to healthy habitation and construction; all beyond we should advise him to defer till after his term has expired, and he thinks of preparing for one of the professional examinations, when a more advanced and comprehensive course might be gone through at the option of the candidate. Till this period arrives, we think the pupil's attention and study should be limited to a few of the main scientific facts

and principles of his art, and these should be learned thoroughly instead of being mixed up with a lot of irrelevant matter that may never be wanted, or, what is quite as stupid, their points of application to architecture and building obscured or lost sight of amid a vast number of distinctions and details. The courses of instruction given at King's College, University College, and at the technical schools and colleges in London afford the pupil facilities for carrying out the arrangement we suggest.

In this connection we may mention a Bill, the sections of which are before us, providing for the examination of architects and regulating the practice of the profession in the State of Illinois. The Ontario Association of Architects have already taken a similar course. The examination will have special reference to the construction of buildings, and will test the knowledge of the candidate in the strength of materials, and as to his ability to make practical application of such knowledge in the ordinary professional work of an architect, and in the duties of supervisor of mechanical work on buildings, especially in the laws of sanitation. The Bill has passed the Legislature, and is a proof that Trans-Atlantic architects are beginning to see the advantages of a certificate of competence.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—V.

By AN ASSOC. INST. ELECT. ENGS.

THE GENERATION OF ELECTRICITY.

MAGNETIC FIELDS.—Electricity may be produced in a variety of ways. For commercial purposes, such as electric lighting and the transmission of power, in which cases the quantity of electrical energy required is usually large, the only method at present of supplying the necessary quantity is by transforming mechanical energy into electrical energy by dynamo machinery. We shall therefore consider briefly the fundamental principles, and the different types of dynamos used for lighting purposes. As many are no doubt aware, the two essential parts of a dynamo are—(1) the pole-pieces or magnets, and (2) a rotating bundle of conductors forming the armature. To understand the function of the magnets, we must refer to some elementary

FIG. 3.

principles of magnetism. Everyone at some time or other has had some experience with bar or horseshoe magnets, and we shall assume that the effect which a magnet has on a compass needle, the tendency of a compass needle to set itself in a definite direction in space, as well as the powerful manner in which a magnet attracts pieces of iron and steel are well known. These properties, possessed by all magnets, imply the existence of force, and each impresses us with the fact that magnetic force can be transmitted across space, and that the surrounding medium is under a strain. Technically, any region or space within which magnetic force manifests itself is termed a magnetic field. All magnets and the earth have magnetic fields, and everywhere in such regions the magnetic force has a definite direction and magnitude. If iron filings be sprinkled upon a sheet of paper placed over a bar magnet, it will be found that the filings arrange themselves so as to form curious yet beautiful curves connecting the two ends of the magnet.

Such a picture is shown in Fig. 3, and as it graphically represents the directions in which the magnetic force acts, it is very useful as giving an insight into the nature of magnetic fields. It will be observed, for instance, that near to the ends of the magnet the filings are crowded more closely together, whilst at other parts of the

magnetic field the filings are less densely distributed. Faraday, who adopted this method of investigating magnetic phenomena, conceived the idea of denoting the strength of a magnetic field at any point by the closeness of the filings, and, as a result, introduced the "line of force" theory, a conception which has enabled physicists to grasp and explain many electrical and magnetic phenomena previously not understood. A line of magnetic force is an imaginary line in a magnetic field, which at every point is in the direction of the resultant magnetic force at that point. A field of unit strength is assumed to have one line per square centimetre, and the number of lines of force per square centimetre is a convenient method of representing the strength of a field. From the above figure giving the magnetic field of a bar magnet in one plane, it appears as if the magnetic force springs from two centres of force or points of maximum intensity, situated very nearly at the ends of the magnet. Such points are called the poles of the magnet, and the quantity of magnetism, acting as if concentrated at a pole, is termed the strength of the pole. Important as Faraday's conception of the line of force theory undoubtedly was, it was as nothing compared with his later discovery (in 1831) respecting the induction of currents. For a long time previous to 1831 it had been known that a very close connection existed between electricity and magnetism; but it was not until Oerstedt, of Copenhagen, in 1819, made the discovery that currents of electricity set up and maintain magnetic fields around the conductors through which they are passing, that the true connection between electricity and magnetism was understood. In fact, the conductor is equivalent

FIG. 4.

to a magnet so long as the current lasts, and the magnetic field set up is identical in its properties with the field due to a bar magnet. If a picture be obtained (by means of iron filings) of the field set up by a current, it will be found that the lines of force are circular (the filings being arranged in concentric circles about the wire as a centre), and that the magnetic influence extends some distance from the wire. The strength of the field at any point depends upon the strength of the current and the distance from the wire. Such a field is shown in Fig. 4, *abcd* being a piece of cardboard in a horizontal plane, and *w* being the conductor threading the cardboard vertically. The direction of the current is denoted by the arrowhead.

When the wire is coiled, as in the upper part of Fig. 5, we have an electro-magnetic spiral, helix or solenoid, and upon investigating the magnetic field which is set up when a current circulates through the coils, we find that within the coil it is intense and uniform, and that its direction is parallel to the axis of the coil, except at the ends. The lines of force are denoted by the dotted lines in the figure. Externally the magnetic field exactly resembles that of an ordinary bar magnet, and, so far as its magnetic properties are concerned, the coil is an ironless magnet so long as the current lasts. It is important to notice that the magnetic field and its properties completely disappear immediately the current ceases.

As is well known, unmagnetised iron and steel become magnetised when placed in a magnetic field, so that if a rod of iron or steel be placed within the coil, as in Fig. 5, B, the metal is strongly magnetised when the current passes. The hollow coil, Fig. 5, H, is simply a magnetising coil, the magnetic field of which is of definite intensity, being represented by H lines per square centimetre. With a soft iron core inside (Fig. 5, B) the intensity of the resulting field for the same current is represented by B lines of force, B being much greater than H, from which we see that the presence of the iron increases the intensity of the field by (B - H) lines per square centimetre. What actually takes place is that the H lines due to the current

magnetise the iron by induction, and thus create (B - H) lines in the iron core. The result of placing iron in the coil is two-fold—(1) It concentrates the lines of force, iron being a good conductor of magnetic lines of force; and (2) it increases the number of lines by induction.

B is known as the magnetic induction. With the quality of iron used for dynamos, B is one

FIG. 5.

thousand or more times H. The arrangement represented by Fig. 5 B is termed an *electro-magnet*, and, as we shall presently see, it is essential to have very intense and uniform magnetic fields for the production of currents of electricity by mechanical means. In practice such fields are produced by arranging one or more pairs of electromagnets, as shown in Fig. 6, so that in the space S the field is very intense and uniform, as shown by the dotted lines. The parts P, P, E, M, and Y are the iron parts of the dynamo, E, M being the cores of the electromagnets (the coils of wire not being shown), Y is the yoke connecting the cores, and P, P are the pole-pieces. The pole-pieces are arranged so as to concentrate the lines of force between the poles of the cores, and are also shaped so that the armature may rotate in the space where the field is intense.

Induction of Currents.—The phenomenon with which we are mostly concerned, however, is the generation of an electrical pressure by the rotation of the armature in a magnetic field, and, as we have already mentioned, it was in 1831 that Faraday discovered that a current is induced in an independent circuit placed near a magnet whenever the relative positions of the two change. This discovery was the most important and brilliant achievement of the many announced by Faraday, as it marks the beginning of a new era in the history of electricity and magnetism, and undoubtedly it is the foundation upon which the whole superstructure of electrical engineering has been built.

Faraday's discovery, it will be observed, was the converse of that of Oerstedt, and Faraday appears to have clearly foreseen that the setting up or changing the strength of a magnetic field of force around a conductor would generate a current in the conductor (if it formed a closed circuit) just as the starting of a current in a conductor sets up a magnetic field of force around it.

FIG. 6.

To get a clear insight into the cause of induced currents, let us consider what takes place when relative motion takes place between a magnet and a closed coil of insulated wire. As we have already explained, the medium surrounding a bar magnet is filled with lines of force which radiate from the N. pole on all sides, and it is obvious that when the coil is placed near the pole of a magnet, as at A, Fig. 7, more lines of force will pass through it than when it is farther away, as at B in the same figure. Consequently, when

the coil is moved from A to B a change is produced in the number of lines of force passing through the coil, and when this takes place an induced current is set up in the coil, which, however, lasts but for a moment. If the coil be moved towards the magnet, the number of lines of force will be increased, and a momentary induced current will be set up in the opposite direction. But we know that if a current be produced there must also be an E.M.F. set up in the coil, and this is known as the E.M.F. of induction. This E.M.F. is set up (when the above changes take place) whether the circuit is closed or not, the E.M.F. of induction always being produced when the intensity of the magnetic field surrounding the conductor is changing, and the magnitude of the E.M.F. set up is a measure of the rate of change in the intensity of the magnetic field. The two extreme cases are, when the magnetic field is set up around the conductor and when it collapses, and it is immaterial whether the conductor is introduced into a magnetic field or is removed from it, or whether a magnet is brought near the conductor or is removed from it. The existence of the induced momentary currents may be shown experimentally by inserting a delicate galvanometer in the conducting circuit.

The Dynamo.—We thus see that the broad features underlying the production of induced E.M.F.'s is the interaction between a magnetic field and a conducting circuit, and we may mention here that it is to the credit of engineers that mechanical means were soon devised and efficient machines constructed, with the result that the momentary induced currents discovered by Faraday may be used on a commercial scale.

FIG. 7.

The dynamo, however, does more than interlink a conducting circuit with a magnetic field. It produces an intense magnetic field, and permits of the rotation of an armature in that field, so that the lines of force are cut at a rapid rate, and an electrical pressure set up in the rotating armature; in addition to this it also collects and delivers to an external circuit an unlimited quantity of electricity without interruption. We scarcely need point out that the mechanical energy expended in driving a dynamo is greater than the electrical energy produced; it is, however, difficult to understand how the mechanical energy is absorbed. We have seen that the magnetic field is under a strain, and it owes its properties to the medium being able to withstand the application of the stress, whilst in the conductor forming the armature the field breaks down in consequence of the energy being conducted away, so that the mechanical power has to be continually supplied to build up the field (in the conductor) as the conductor is being rotated. The energy conducted away may in its turn do useful work in the external circuit.

As we have indicated, the armature is usually the moving part, although in some machines we have the converse arrangement—i.e., rotating field magnets and stationary armature. Generally generators are divided into two distinct types of machines—i.e. (1), the direct continuous-current dynamos, and (2) alternators. The latter class are typical of the machine so far explained, since we have not mentioned any arrangement for rectifying the alternating character of the current produced. A little reflection will show that a coil of wire rotated between the pole-pieces will be emptied and filled twice each revolution; consequently the direction of the current will be reversed twice each revolution, and, as the armature makes a large number of revolutions per second, the character of the current will be that of a wave rising and falling the same number of times per second—that is, we have an alternating current. Except in central stations for supplying large and extended areas, this type of generator is not in general use; consequently we shall deal specially with the direct continuous-current dynamo, and show how the alternating currents are changed into direct currents.

Fig. 8.

The Armature and Commutator.—The armature in many respects is the vital part of the generator. It consists of spirals of insulated wire wound on an iron core. When we remember that the function of soft iron placed in a magnetic field is one of concentration, it will be seen why iron cores are used. We have already mentioned that the magnitude of the electrical pressure set up in the rotating armature is proportional to the rate at which lines of force are looped with the conducting coil, and it is evident that this rate, and consequently the E.M.F. produced, will be increased by augmenting the number of lines of force passing through the coils and also by increasing the speed. These iron cores are of two kinds, giving rise to two fundamental types of armatures, known as the ring and drum armature respectively. With the ring armature, as the name implies, the core is of the nature of a ring, or, more correctly, a hollow cylinder built up of a large number of soft iron discs bolted together, and the wire is wound on as shown in Fig. 8 I.

Fig. 8 II. shows a section of the core with the method of connecting the wires to the commutator segments. The reason the core is built up of discs, and the plates electrically separated from each other by paper, as they always are, is to prevent the production of eddy currents in the core. These currents are always produced in large quantities when a solid mass of conducting material is alternately magnetised and demagnetised, and as they must of necessity spend themselves in the material, immense quantities of heat are produced, and this, of course, means so much waste. The core, built up as we have explained, is rigidly secured to the rotating shaft by means of a hub or spider-frame made of some non-magnetic material, as shown in Fig. 8 I. The conductor may be one continuous coil wound in section as shown, the ends of each section being metallically connected to

in the external circuit, to which the commutator is connected by means of the brushes. Commutators are not used in alternators, the undulating character of the current being given to the external circuit by means of positive and negative collecting rings.

(To be continued.)

NOTES ON SURVEYING AND LEVELLING.—I.*

By WALTER TESTER.

THERE are several textbooks which deal with the construction, adjustment, and reading of the theodolite and level, and it is not proposed in these articles to discuss that portion of the subject, but to consider some examples of surveying, setting-out, and levelling with these instruments which have actually occurred in practice. There will also be introduced incidentally many practical points which arise on any large architectural or engineering works, which are dealt with by the men on the ground, and which the men in the office never bother their heads about. Any average surveyor knows how to set and read the theodolite and level in the office; but let him be sent out on to the site and required to set out some work on the ground, and he will find himself confronted by a number of obstacles and difficulties never thought of in the office. The ground is perhaps exceedingly irregular and covered with trees and brushwood, or perhaps building materials and plant are in the way of his lines.

It is the object of these notes to try and give him an insight into the manner in which such difficulties are overcome, by examples based upon works actually carried out, and, in order to make everything as clear as possible, some of the drawings, dimensions, and data from which these works have been executed will be reproduced.

The examples are taken from works recently completed, or now in progress, at the New Brighton Tower grounds, under the management of, and from designs prepared by, Messrs. Maxwell and Tuke, the architects and engineers, and it is by their kind permission that many of the drawings accompanying these Notes are reproduced.

The intention in these articles is to make the surveying operations as carried out at the New Brighton Tower works a groundwork or basis for an instructive series of examples in the use of the theodolite and level, and in surveying generally. It must, therefore, be understood that these notes are not necessarily a description in detail of the methods there employed, but that the latter have been more or less modified to suit the requirements of these examples.

It will readily be understood how admirably suited for the purpose the New Brighton Tower works are from the following classification of the proposed articles:—

- (1) Survey of site and preliminary levelling operations.
- (2) Setting out tower buildings, octagonal in shape, with four wings off alternate sides of the octagon.
- (3) Setting out the base of a steel tower, also octagonal on plan, with eight main pillars, one at each corner of the octagon.
- (4) Setting-out the athletic grounds, consisting of central football-field, around which is a running-track, and outside the running-track, and separated from it by a grass verge, is a cement cycling track.
- (5) Setting-out a circular building under the end of cycle track.
- (6) Setting out approach roads to the buildings,

* The illustrations by kind permission of Messrs. Maxwell and Tuke, the architects and engineers.

also walks and drives in various portions of the grounds, lake, &c.

SURVEY OF SITE.

Let us imagine our surveyor sent over to New Brighton, with instructions to make an accurate survey of the site shown on the plan, Fig. 1, and to get a series of sections up the cliffs at the river front, and as many levels as he can in a limited time. He should previously have made sure that his instruments are in adjustment, and all his tackle in working order, and he should have provided himself with two chains in case of accident. His first care will be to have a good look round the site and to make up his mind the best way to get his lines through. He finds that there are many obstacles in his way—the ground being densely covered with trees and brushwood, and being exceedingly irregular in outline, consisting for the most part of blown-up sandhills. The site is an old family residence, and the family being still in possession, the surveyor is to do as little damage as possible, and is on no account to cut down any trees to clear his lines. The accompanying plan, Fig. 1, will give a correct idea of what the site is like, and we will suppose that the surveyor has provided himself with a copy of the Ordnance Survey to 2500 scale, or 208-33ft. to the inch (the 3750 scale is not published), which will help him considerably to localise points on the ground. Having taken a thorough look round and familiarised himself with the position of the buildings and other features, he should by this time have made up his mind how to arrange his main lines. His first object is to get the boundary of the estate surveyed, and in this case it is well defined, a wall having been built all round the grounds.

The plan, Fig. 1, shows the lines selected, and it will be as well to give a few words of explanation why they are adopted. The line A B is first chosen practically parallel to the boundary-line at this side. It is kept as close up to the boundary as possible, so as to reduce the length of offsets, thereby diminishing the chance of meeting with obstacles on the offset lines, this part of the ground being covered with trees; it will also otherwise facilitate the work. The portion at the top of the cliff is first fixed so as to clear all trees, and it is then produced down on to the river front by means of the theodolite, the instrument being set at a point in the line near the top edge of the cliff, and the vertical hair being made to coincide with a pole placed at A; then, the instrument being clamped, the telescope is turned completely over, and the line produced in the opposite direction. This is on the assumption that the instrument in use is a transit theodolite; if it is not, the only way is to set round an angle of 180°, and it is advisable to do so even with the transit, as a check to see that the axis of the telescope is in adjustment. The line A B should be run well out on the river front, and two points M and B marked on it. These points should be retained by driving a long nail or an iron bar into the rock which we will suppose crops out here and there above the sand. The theodolite should next be placed over the point B, and a right angle set out off the line B A in each direction towards K and C. The reasons for having two lines at the river front are these:—(1) The point B being well out from the cliff, a good long sight can be obtained along the line B A, making the angles A B C, A B K, truly square off B A. (2) The line K C is too far away from the front boundary, so that L M has to be used for the offsets. (3) It is required to get a series of parallel sections up the cliff at the river front, and the two parallel lines are to be used for setting these out. This is also the object of making these lines square off B A, it being the intention to use that line for the first section. All that need be done to mark out the other sections is to measure out along each of the lines B K and M L a series of points, the distance apart of the sections, and taking the corresponding points in each line, they can be sighted up to the top of the cliff; M L and B K being kept well apart, and the ground at the river front being nearly level, the section lines can be accurately and quickly marked out. Of course the surveyor does not set these section lines out yet, but simply retains the requisite points.

The next line the surveyor settles is one along Egerton-street, marked C D, and this presents little difficulty, as the ground is clear; the only point to be noted is that he will have to fix the portion of the line near D first, and produce it towards the river with the theodolite, as described for A B, marking the point C. The portion D F

Fig. 9.

successive pairs of commutator bars, C B in the figure, on which the brushes (B) press. The function of the brushes, which usually consist of copper gauze pressed together, is to establish communication between the armature coils and the external circuit. They play no other part in the production of electricity.

The drum winding will be understood from Fig. 9, from which it will be observed that nearly all the wire forming the armature is actively engaged in cutting the lines of force, since they are all external wires; whilst with the ring winding less than half is used for that purpose, all the internal wires being unable to cut the lines of force. With both kinds of winding the wire is wound compactly, and since there is a powerful pull exerted on the wires which resist the motion of rotation when a current passes through the armature, the conductors are bound together by binding-wire, so as to prevent the armature conductors flying asunder.

The commutator is built up of wedge-shaped bars of hard copper, phosphor-bronze, or gun-metal, insulated from each other by thin strips of mica. The function of the commutator is to rectify the current, it being simply a device by means of which the alternating currents in the armature are made to flow in one direction only

NEW BRIGHTON TOWER

PLAN OF SITE

FIG. 1.

of this line is required for the boundary of the estate, which comes up to Egerton-street just here, and it is, in any case, desirable to put the full length of Egerton-street on the plan from the point F down to the river front. The line CD also serves to complete the closed figure ABCDE, of which more will be said presently. The line DE is for taking both sides of the short street shown on the plan, and it is not necessarily at right angles to CD; if it is not made so, the angle CDE will require to be measured. The surveyor finds he cannot conveniently produce the two lines BA and DE to meet, owing to the height of the boundary wall and the ground on the estate side being low-lying. He therefore closes up the figure with the line AE, the point A being on a rise of the ground he is able to see over the boundary wall to the point E.

The surveyor must measure accurately with his theodolite each of the angles ABCDE (it will not be necessary to take the angles B and D, as they are set out at right angles with the instrument), and the sum total of these angles, if accurately measured, will amount to

540°. And here the opportunity will be taken of pointing out a useful little rule for finding the sum of the angles of any closed rectilinear figure.

FIG. 2.

Take a figure of shape shown on the sketch (Fig. No. 2), having five sides. Select a point inside the figure, and join a line to this point from each of the angles.

The area of the figure is now split up into five triangles, and as the three angles of every triangle add up to 180°, the sum of the angles of the five triangles is $5 \times 180 = 900^\circ$. There are obviously 360° in the five angles at the central point, and deducting 360 from 900 = 540° for the sum of the ten angles at the corners of the original figure. This method applies to any rectilinear figure, whatever the number of sides, the rule to find the sum of the angles being—multiply the number of the sides in figure by 180 and deduct 360. It also applies to a figure of the shape shown in the sketch (Fig. 3), containing an angle exceeding 180°, taking, of course, the angle as dotted. The surveyor should always, if possible, make a closed figure as here shown, as he can then check his angles in the way explained; and if they do not add up to the correct total, he will have to go over them again to find where the mistake lies.

We now come to the main figure CGHJK (Fig. No. 1) of which the lines KC and CG are already marked out. The surveyor walks over ground from F towards J, with a view to fixing a line adjacent to the boundary, and

he finds that this is the most irregular and difficult portion of the site to get his lines through. He decides that the easiest way to deal with this line is to let it cross to the outside of the estate near J, the ground thereabout having been levelled for a school playground. Standing on a ridge about midway between H and J, he can see towards F as far as point H, which is at the top of a sharp rise, the ground near F being a deep hollow; this ridge is the only spot from which he can see towards J. He sends a man with a pole to a point near H, which can be seen from the ridge, and he finds that the only point on the line D F from which this pole can be seen is at G by looking through the entrance gateway. It should be understood that there is a high wall along Egerton-street, from G to F, and that he cannot possibly see point H over this wall. He can now fix the points G and H, and setting his theodolite on the ridge between H and J, he can produce a line towards J by turning the telescope over, as already described if a transit, or by setting round an angle 180° if not. Point J can now be marked. In the same way this line can be produced towards F by setting the theodolite at H. There is no difficulty

FIG. 3.

about the line J K, as it runs down a portion of ground belonging to the estate formerly used as an entrance road; the only point that needs mentioning is that it will have to be produced down on to the river front in the way described for lines A B and D C by turning the telescope of the theodolite over. Having completed the closed figure C G H J K, he should next take each of the angles, and these, when added up, should come to 540° as already explained. The point L should be marked on the line J K, making K L equal to B M (K L should be measured along a line square off K B, if the angle at K is not a right angle).

All the main lines being fixed, and the angles accurately taken, it only remains to measure the lines and take the offsets in the usual way. However, care must be taken in working up the cliff, to get the chain up level, and to see that where it is held up off the ground that it is plumb over the point. It is better, if the surveyor can spare the time, to measure all the main lines first before taking the offsets, working up the slopes with the tape, which can more easily be held up level, and carefully plumbing up where the tape is held off the ground with a plumb-bob. He will have to go over the lines again, and take the offsets, and this will be a check on his lengths. He will in this way satisfy himself that his main dimensions are correct, and, being sure on this point, should have no difficulty whatever in plotting the survey.

FILLING UP THE INTERNAL FEATURES.

The surveyor has not much choice in selecting the lines for putting on the drives, walks, &c., and he cannot do better than let the lines follow them in direction as shown on the plan (Fig. 1), taking as long lengths as the bends in the roads will permit, and joining the lines at the ends into the main ones of his survey. In this way he will make two closed figures, A N O P Q K B and Q R S T U B K, and each of the angles of these figures should be accurately measured (where not already taken) with the theodolite, and the sum of the angles of each closed figure checked by the method already given.

Advantage should be taken of any open spaces to obtain cross measurements to tie the lines

together, and any further lines that are required, as for instance, N W or X V can easily be connected to those already fixed by angles and measurements; in fact, the surveyor can form a number of secondary closed figures. It will readily be understood that when the main lines are accurately fixed in position there will be little difficulty in tying on the buildings, and offsetting the drives and walks in the usual way. The surveyor can also take any measurements and notes for filling up on his plan the portions of the ground which are covered with trees, or for putting on any other features of the ground. His sections will also help him in this respect.

NOTES FROM PARIS.

THE ancient and fine Chateau d'Amboise, the birth and death-place of Charles VIII., and in 1850 the prison of Abd-el-Kadir, is at present undergoing a thorough restoration and transformation in view of making the building more suitable for the purpose of inhabitation. The chateau, situated amidst magnificent gardens on the hill-side overlooking the town of Amboise, was, on the death of the Comte de Paris, bought by the Duc d'Aumale with the intention of installing it as a retreat for the old servants of the family of Orleans. The work of restoration and reconstruction is proceeding fast, the fine Louis XIII. pavilion is nearly completed, and it is intended that the building shall be completely finished and installed for 1899.

The Ouest Railway Company have now submitted to the Minister of Public Works the plans and elevations of the new station which it is proposed to raise on the Esplanade des Invalides, and which will form the terminus station of the Moulineaux railway on the left bank of the Seine. It will be remembered the discussion and bitter feeling which the idea of building a railway station on the fine esplanade caused some little time ago, and the protests made by the Amis des Monuments Parisiens against the spoiling of the esplanade and the view of the Hotel des Invalides, protests which, however, gave way before the promise that the station should be built entirely underground. This station will, however, be much more important than was supposed by the defenders of the esplanade, for it will receive the important lines of the Ouest railway from Brittany and Normandy via Versailles and Mantes, as well as several suburban lines; it is, therefore, found impossible to establish the whole building entirely underground as was promised; the façades will rise considerably above ground, and it is regarding the aspect of the elevations above ground that the Minister will have to decide. There will be two buildings, one on either side of the esplanade, and the station will be connected by a platform on both sides with the new bridge Alexandre III. The buildings are designed in the Louis XIV. style, which is that of the Hotel des Invalides; but, although the elevations are somewhat effective, it is doubtful if they will be at all in keeping with the palace built by Louis XIV. for the veterans of his armies.

The Union Centrale des Arts Decoratifs has decided to open a competition for the purpose of provoking the creation of original designs and objects of decorative work destined to figure at the Exposition Universelle of 1900. The programme states that the various compositions should present a certain harmony of purpose and unity of idea, such as designs for the fixed or movable decoration of the dwelling, furniture, utensils, &c., or, again, the ornamentation of the person, such as silks, cloths, jewels, &c. Each competition is fully open to artists and artisans, and the greatest liberty is given to the inventive genius of the competitors and the choice of the ideas they may present. The purpose of the Union Centrale des Arts Decoratifs is to give an incentive to the production of new ideas, which shall not only serve for the embellishment of the luxurious dwellings of the rich, but also be available and fit to enter into the existence and homes of the less wealthy; and, in view of this, the competitors are advised to search out and create objects of moderate price and general utility, and resist giving way to the usual temptation to produce only works of an exceptional richness and costly execution. Prizes to the value of £1,300 are offered, and it is expected that these various competitions will result in the production of artistic novelties suitable to the age, and logically adapted to the many new materials and means of execution which the end of this century places at the disposal of art-workers.

The work of constructing the new bridge Alexandre III., which will cross the Seine in the axis of the Invalides and join the Champs Elysées to the esplanade, is now rapidly advancing. One of the two immense caissons is completed, and is very nearly sunk to its proper depth, the other is nearing completion, as regards construction. The bridge will measure 358ft. in length between the abutments, and 132ft. in width. Its axis coincides with that of the Invalides, but the bridge will not quite form a right angle with the Seine quays. The bridge is being constructed of steel, and will have three articulations, one at each abutment and one at the centre, forming one low-centre arch. The dimensions of the caissons are 145ft. by 110ft. and 13ft. high, and will contain 208,000c.ft. of masonry and concrete. The construction of these two enormous caissons is being undertaken by MM. Daydé and Pillé, two well-known and experienced constructional engineers.

The demolition of the Palais de l'Industrie is now completely terminated, and the architect of the new palais, M. Girault, will at once commence setting out the foundations of the new building.

The Office of Inspection of the Quarries of the Seine has just published an interesting album of plans, sections, and particulars of all the known ancient quarries and catacombs which undermine whole quarters of Paris. As all particulars are given of the exact positions, heights, and widths, and depths under the surface, this album will be highly useful to all intending purchasers of building land in Paris and to the contractors for the building work; it will also help to avoid the unpleasant discovery, now so often made after purchasing ground for building, of the deep quarries which may undermine the site, and which necessitate costly walls of masonry and deep foundations for the proposed building; it will also enable the contractors to estimate to a near degree the cost of the foundations, which, in many cases at Paris, forms one of the most important items in the cost of building. In two recent buildings which the writer has undertaken the quarries under the site necessitated foundation walls to a depth of over 40ft., and in the smaller building the nine masonry pillars destined to support a simple two-story house were carried down to this depth, costing a considerable sum, and affording an unpleasant surprise to the client, who had no idea of the nature of the subsoil when he purchased the ground. The superficies of the quarters of Paris which were employed for excavating gypsum and building-stone is estimated at 7,800 acres, and, of the twenty arrondissements of the city, seven only are free from any known excavations, all the other quarters being more or less undermined. The abundance of these two materials for building is probably one of the chief causes which tended to produce such a rapid development of the old City of Lutèce. The 14th arrondissement is simply honeycombed with underground quarries, which develop a length of nearly 800 miles, of which 280 have been consolidated at various times. The distance from the level of the streets to the roofs of these quarries varies from 23ft. to 100ft., and the average height of the galleries is 6ft. The catacombs or ancient ossuaries have a superficies of 500 acres only. A large proportion of these various galleries, some of which are superposed in three tiers, have been filled-in to a certain extent, or have, as was done with those under the Buttes Chaumont, been destroyed by blasting, and the fissures formed on the upper surface filled in. After the many serious accidents which took place in 1774 the Government began to look into the question of inspection and consolidation, but it was not until 1813 that any serious measures were taken. Since that time a great deal of work has been done in strengthening some of the galleries and filling-in others, and, owing to the constant danger of a subsiding in one or other of the streets, a continual and careful inspection is made; but it is thought probable that there still remain a large number of galleries which have not as yet been discovered.

One of the first of the more important competitions for the buildings of the Exposition of 1900 has lately been opened by the Ministre de la Guerre for plans and designs for the buildings to contain the exhibitions of war and marine, and the military exhibition, to be placed on the Seine quays, near the Champ de Mars. The buildings will be important and occupy a considerable space; that of war will cover 65 acres, and that of marine 32 acres, while the exhibitions of modern and ancient implements of war will occupy 25 and 37 acres respectively.

The well-known and respected Parisian archi-

tect, the late M. Henri Blondel, not long ago one of the richest of his contemporaries, has just died in absolute poverty. Born at Reims in 1822, he since rose from the state of a simple workman to that of an architect intrusted with the most important private work at Paris, from 1855 to his death, and during this time contributed greatly to the embellishment of Paris. His ability and knowledge of business enabled him to find work where others saw little to be done, and he created many vast works of enterprise and speculation. He constructed the buildings for the Caisse des Dépôts, on the Avenue de l'Opéra; the Passage de l'Industrie, on the Boulevard Sebastopol; the immense shops of the Belle Jardinière; the vast Hotel Continentale; the new Quartier Marbeuf, and the Bourse de Commerce on the Rue du Louvre. Two years ago, however, at the age of 72, through a stated error of judgment on his part, or, it may be by reason of a suite of unlucky circumstances, he was found debtor for the sum of 25,000,000f. and declared bankrupt, and other misfortunes followed in the wake of this; the once-rich architect, flattered by all, was abandoned even by those who had become rich through his enterprise, to struggle through the two years of life left him. He was awarded the Medal of Private Architecture by the Société Centrale des Architectes in 1878, after the inauguration of the Hotel Continentale, and shortly after was made Chevalier de la Legion d'Honneur.

A series of interesting experiments are now being made with various materials and substances capable of rendering light materials incombustible, in view of the buildings of the Exposition, and every really practical means of avoiding the danger from fire is being sought after by the Administration. The large wooden building in the Avenue Rapp, which will be used for the general offices of the Exposition, will be at once rendered fireproof by one of the substances proposed; but, as it is probable that incendiary experiments will not be tried on this building, an accident will be necessary in order to show the efficiency in a large building of the means of fireproofing employed.

It is possible that a very important and interesting competition will be opened at an early date for a palace destined to receive the various royal hosts who visit Paris from time to time. There is much complaint that Paris possesses no special building for this purpose: the royal visitors are housed, as best may be, in mansions hurriedly installed for each special reception; and as in 1900 it is hoped to receive more than one royal guest, it is proposed that a convenient and luxurious mansion be erected, and to be called the Palais des Souverains, one practical suggestion being that the ground now occupied by the picturesque, but inglorious, ruins of the Cour des Comptes, be utilised for this purpose.

The Ecole des Beaux Arts, which, for several years has been menaced with ruin, is being restored and repaired. This building is one of the oldest of Parisian monuments—it was in former times the celebrated Hotel de Chimay. The Ecole des Beaux Arts, which now occupies the ancient building, was instituted in 1648 by Louis XIV. after a report made to the king by the celebrated painter Le Brun, and was suppressed in 1793. In 1795, however, it was again installed and united to the Académie d'Architecture.

One of the most interesting buildings of the Exposition will be the Palais du Bâtiment, if carried out according to the proposed scheme. The idea is to construct a building which will form a practical application and example of all the newest materials for building work, and all the most improved systems of the art of construction, ventilation, heating, &c.; the most interesting specimens of decorative work for the interior of private buildings, and the latest and most improved applications of sanitary work, electricity, and all the new practical inventions of all kinds suitable to building which this age of research and invention can produce. The idea is certainly very interesting, and the conferences which it is proposed to hold in the building would not be less so; but it seems doubtful if the idea could be properly put to execution, for unanimous decisions on the perfection or superiority of such or such a system or method to be employed could hardly be arrived at.

The corporation of Edinburgh have under consideration a report by Mr. Herring, their engineer, recommending that the gasworks should be removed from the valley between the Old and New Town to some other site elsewhere.

CONSTRUCTION OF ARCHES IN CONCRETE.—XII.

THE construction and testing of the third example of the large bridges of 76ft. span now claims our attention. But, previously to describing it in detail, it will be instructive to refer to Figs. 1 and 2, which record the results

FIG. 1.

FIG. 2.

omitted in the diagrams. The concrete arch was given a width of 16ft. and a uniform depth of 2ft. 9in. For some reason, which is not by any means clear, the concrete used was not of uniform consistency, but was mixed in three different

FIG. 3.

FIG. 4.

proportions, 2 to 1, 5 to 1, and 8 to 1. The first two of these were employed at the intradosal and extradosal points, where, by *a priori* calculation, stresses of a tensile character were anticipated, while the body of the arch was built with the third composition. They were all three thus prepared. Fairly hard sandstone was broken to a 1½ in. gauge, the gravel and sand were procured from the bed of the river Danube, and the Portland cement was of an approved and tested quality. In all the three mixtures or classes of concrete the volume of the Portland cement was

were observed to have occurred near the springing of the opposite and unloaded semi-arch. Upon the removal of the load, the arch returned to its normal position—righted itself, in fact—as its deflection amounted to only 0.12in. At the same time, the cracks practically closed up; but this recuperative action was only of a temporary character, for no sooner was the load again superimposed than they reopened. It was not, however, until a rate of loading equal to 2.06 tons per foot run was attained that the existing fissures evinced any signs of increased

FIG. 5.

FIG. 6.

constant. Calling this volume unity, the proportions of the other ingredients were as follows: In the first mixture, gravel ½, broken stone ½, sand 1; in the second, gravel 1½, broken stone 1½, sand 2; and in the third, gravel 3, broken stone 2, and sand 3. Four mixers were at work, two gangs of punners and cement masons, and the laying and ramming of the material was carried on with the greatest regularity from each of the abutments to the crown of the arch.

dimensions. With a total surcharge of 83.315 tons, equal to 2.2 tons per running foot, the arch gave way at three points, fairly approximating to the section where the first fissures appeared. The maximum deformation or vertical displacement on the unloaded half-arch did not exceed 0.36in., and the corresponding horizontal deviation was limited to 0.26in.

While the task of breaking up and removing the *membra disiecta* of the fallen structure was in

course of accomplishment, some very valuable and interesting information was obtained bearing upon the general construction of arches of concrete, built on the simple system. In the first place, the evil effect of employing different mixtures of concrete was abundantly in evidence. It was found that in every part of the structure where the concrete was not of uniform composition it separated into regularly distinct layers. For example, the 2 to 1 and the 5 to 1 mixtures, represented by the thick black lines in Figs. 3 and 4, parted completely from that of 8 to 1, forming the body of the arch between them. This circumstance, which is certainly somewhat peculiar, is the more to be wondered at because the three different descriptions of concrete were laid on so quickly that there was every facility for their becoming thoroughly amalgamated and incorporated. It was no question of permitting a layer or layers of one kind to partially set—even to a trivial extent—before the other was laid on it. There was no original straight joint, either vertically or horizontally, in the whole mass. It might be said, in attempting to explain this curious phenomenon, that the concrete might not have been sufficiently well rammed in some parts of the work, and hence there would have been a decided and readily comprehensible tendency for the successive layers to detach themselves the one from the other. This theory, however, will scarcely bear serious and close investigation. To begin with, the greatest care was taken that the ramming of the concrete should be done in the most workmanlike and efficient manner possible, and there is not the slightest doubt but that it was so done. Furthermore, the severance between the different mixtures was universal throughout the whole structure, and not observable only at certain places, as it would have been, had it been due to insufficient ramming. It may, therefore, be safely accepted, judging from the practical and unimpeachable evidence before us, that although there is no theoretical argument against the employment of various descriptions of concrete in one and the same structure, yet the exigencies of practice clearly indicate that but one uniformly-constituted mixture is the best to adopt. A further examination of the *débris* revealed the fact that parts of the concrete were considerably harder than others, and the cause of this difference was distinctly traced to the employment of the three kinds of material. The effect of protecting the concrete in the loaded half arch from the action of the sun, does not appear to have been attended by the beneficial results expected, as there was a considerable amount of humidity discovered in the body of the work. In the other unloaded half, which had not received the same amount of attention as its fellow, there was no evidence of any undue dampness. It should be remarked that the thrusts on the points of support, were efficiently provided for, since the plates of asphalt introduced at each springing performed their duty without flinching—that is, without undergoing any perceptible deformation. Although plates or layers of asphalt or asphalted felt inserted at the springings serve to possibly distribute the load more uniformly over the bearings, it is very doubtful whether they are of much use, so far as allowing any small angular movement to take place. They cannot be said, on the one hand, to have all the advantages of a complete encasement, nor, on the other, do they impart to the arch the benefits of the pin, hinge, pivot, or other form of thorough articulation. They probably occupy an intermediate position, and fulfil a half-and-half kind of duty.

It ought to be stated that the authorities conducting on a scale of magnitude quite unparalleled in the annals of construction the tests and experiments under notice, strongly opposed the use of different mixtures of concrete, and the result amply confirmed their just condemnation of all such heterogeneous compounds. It has been suggested that if a different form of arch had been adopted, which would have restricted to very narrow limits the tensile stresses, the separation would not have taken place. There is one point deserving of attention in comparing the arch of concrete with the similar examples built of brick and stone. It is that the depth of the first, as shown in Fig. 3, is uniform, whereas in the other two it increases from the crown to the springings. In the brick arch the increase is effected by successive radial offsets, and in that of stone it is gradual and regular. There is no question that the depth of the concrete arch

should have been increased in the same direction, if not in the same proportion, as in the other two structures. Independently of all practical considerations, the theory of the arch clearly indicates the necessity of this mode of construction, as we shall point out. Let W equal the total load in tons, dead and moving or live load, uniformly distributed over the arch; put R equal to the ratio of the span to the rise, and S and S_1 for the stresses at the crown and at the springings, then we have for the former—

$$S = \frac{W \times R}{8}$$

and for the latter—

$$S_1 = S \sqrt{1 + \frac{16}{R^2}}$$

It is true that these values have to be slightly varied according to the particular manner in which the arch is attached to its supports; but this does not affect the principle we are contending for. Or it may be thus stated, taking θ to represent the angle between the direction of the compressive stress = S_1 at any point of the arch, and the remainder of the notation as before. Then—

$$S_2 = S \times \sec. \theta;$$

but as the value of S is a constant quantity, that of S_2 will vary with $\sec. \theta$, or as it may be expressed—

$$S_2 \propto \sec. \theta;$$

and since the secant of any angle varies as the value of the angle itself, we have at the crown—
 $\sec. \theta = 1$ and $S_2 = S_1$.

At the springings θ is a maximum and $S_2 = S_1$.

It has been already mentioned that specimens of the mortar, whether lime or Portland cement mortar, and of the concrete were taken at random during the construction of the arches, and subjected to breaking tests. These varied, for cement mortar, as might be expected, with the different proportions in which the ingredients were mixed, from a minimum of 440lb. to 500lb., and as a maximum to 570lb. per same unit. It must be admitted that these discrepancies, although they are not of a magnitude or importance sufficient to invalidate the results arrived at, yet they do certainly, to some extent, detract from their value. Unless, in making experiments for the purpose of comparing the relative powers of resistance, either of different simple materials, or of structures built of different materials, the conditions are as nearly identical as human skill and forethought can make them, they do not give the thorough satisfaction they would otherwise do. There is an element of doubt, a factor of uncertainty introduced into the results, which cannot be altogether eliminated, and which it is exceedingly difficult to adequately or inadequately, as the case may be, allow for.

CHIPS.

New board schools are in course of erection on St. John's-green, Colchester. Messrs. Grimwood and Son, of Ipswich, are the contractors.

The Trinity Brethren have decided to erect a lighthouse at Pendeen, North St. Just. The point selected is close to the coastguard buildings. It has a full sweep of dangerous coast. Gurnard's Head lies three or four miles N.N.E.

The new chancel of St. Andrew's Episcopal Church, Wishaw, was dedicated on Saturday afternoon by the Bishop of Glasgow and Galloway.

An inquiry has been held in Sheffield with regard to the scheme of the London and North-Western Railway Company for the provision of workmen's dwellings in place of those to be demolished on the erection of the new goods station at the rear of Wharf-street.

Grove Academy, Broughty Ferry, the first portion of which was erected seven years ago, has within the past few months been completed according to the original design, and it was formally opened on Monday by Sir Henry Craik, secretary of the Scottish Education Department.

A difficulty has arisen in connection with the Wentwood scheme of water supply, now in course of construction for the corporation of Newport, Mon., a trench 90ft. deep having been filled with concrete, which has been pronounced defective. Mr. Baldwin Latham, who was consulted, recommended that the concrete should be taken out to the width of one yard, and to the depth of the bottom of the trench. The work is estimated to involve an outlay of £20,000. The undertaking of the Newport Water Works Company was taken over in June, 1888, by the Newport Town Council.

OBITUARY.

A PROLIFIC creator of graceful and vigorous Shakespearian and historical characters and a munificent donor to the art collections in the principal English cities has passed away in the death of Sir JOHN GILBERT, R.A., the octogenarian President of the Royal Society of Water Colours, which occurred at his residence at Vanbrugh Park, Blackheath, on Tuesday last, after long suffering from paralysis. Born in 1817, in the village where he died and where he had lived all his life, John Gilbert early manifested his genius, and at the age of nineteen had his first pictures exhibited simultaneously at the Royal Academy at Somerset House, and at the Suffolk-street gallery of the Royal Society of Water Colours, the latter being entitled "The Arrest of Lord Hastings by the Protector, Richard Duke of Gloucester." In 1839 he exhibited at the British Institution, and for half a century his work, both as historical painter and leading artist in black and white, has been constantly before the public. Much of his best work was expended in drawing on wood for reproduction in the pictorial periodicals. It will be recollected that for years he drew all the illustrations for the novels and novelettes which appeared in the *London Journal*, and although much of his work necessarily now appears old-fashioned, the quality was always good and he never repeated himself. His illustrations to Shakespeare, Cervantes, and Longfellow were alike sympathetic, graceful, and firmly drawn, with brilliant effects of light and shade, while the way in which he instantly responded to the unanticipated demands made on his pencil proved his versatility, individuality, and originality. He will be long remembered by his book illustrations not less than by his historical and imaginative paintings, which he produced with equal facility in oil or water media; but it must be admitted that he ever displayed a greater mastery over line than colour. Elected an Associate of the Society of Water Colours in 1852, and a Member the following year, he became President in 1871, a position he has since held, save for resignation, followed by re-election in 1888. He was knighted in 1872, was elected an Associate of the Royal Academy in the same year, and in 1876 became a full Academician. In 1893 he made known his purpose, which he had cherished for many years, of presenting his own collection of works to the nation. His first idea was to build a gallery for their reception and present both building and fixtures to the nation; but he abandoned this scheme in favour of presenting them, suitably framed, to the Guildhall City Art Gallery and the permanent Art Galleries of Manchester, Birmingham, Liverpool, and Blackburn. Sir John Gilbert was never married, a fact to which the nation owes the generous distribution of his best productions. The funeral will take place to-morrow (Saturday) at 2.30 p.m. at Lewisham Cemetery.

A new theatre is about to be built in Stamford and George streets, Altrincham, from plans by Mr. Beasley, at a cost of from £5,000 to £7,000.

In view of the approaching completion of the People's Palace, erected on Glasgow Green by the Corporation, a proposal is under consideration of the council to hold an arts and crafts exhibition in the buildings to be opened about Christmas. The intention is to make the exhibition one of first-rate character, and not to confine it to local contributors only, but to have the collection as widely extensive and representative as possible.

The old post office premises in Queen-street, Wolverhampton, which are not now required by the post office authorities, as the business has been transferred to the new building in Lichfield-street, were offered for sale by auction on Friday. The structure, which is three stories high, with large basement rooms, was erected by the then architect to her Majesty's Office of Works, at a cost of over £10,000. The biddings were started at £2,000, and went up to £2,900, when the lot was withdrawn.

The improvement trustees of Glasgow Corporation have decided to erect three four-story tenements of shops and single and two-room dwelling-houses in Stobcross-street, at an estimated cost of £5,310. The gross annual rental is expected to be £437 15s., of which, after allowing 25 per cent. for upkeep and management, and interest at the rate of 3½ per cent. on the cost of building, £142 8s. 4d. will remain as net rental, being equivalent to £3 8s. 10d. per square yard for the 827 square yards occupied. It is proposed that the 570 square yards adjoining the property should be leased to the Police Department for the erection of a public washhouse.

Building Intelligence.

BASSETT, HANTS.—A new church is in course of erection on the east side of London-road, Bassett, situated between Red Lodge and the turning to North Stoneham Park. Over 30 years ago between £3,000 and £4,000 were promised towards the erection of such a church, but the scheme fell through. The subject was again brought forward early this year. Mr. E. P. Warren, Westminster, was selected as the architect, and prepared plans for a church, which will seat from 400 to 500 persons when completed. The committee only propose to complete a sufficient portion of the church to seat 200 persons, at an estimated cost of about £2,400. The building is in course of construction by Messrs. Holloway Bros., contractors, of Battersea, and the dedication-stone was laid on Wednesday week. The church is dedicated to St. Michael and All Angels. It is to be roofed with a groined vault, and the deep buttresses built to resist the thrust of this vault are placed internally, and pierced with arches to form continuous narrow passage-aisles, the outer walls of which are mere curtain walls connecting the buttresses, and roofed over with a low-pitched roof immediately below the tall nave windows. The nave is thus divided into a succession of deep arched bays. The chancel, which is a direct continuation of the nave, is formed by omitting the passage-aisles, and making the side walls almost flush with the inner faces of the buttresses; at the same time raising the floor, and providing steps for approach. The nature of the structure has been ruled by the strictest considerations of economy, and there has been no desire or attempt to follow an historic style. The materials are local bricks, red for external facing, and Monk's Park stone for all dressed work of doorways, windows, &c. The roof will be covered externally with green slates. For the present the south transept and the two westernmost bays of the nave will be omitted. The church, when completed, will be 99ft. long, and the nave will be 25ft. wide, and, with the aisles added, the total dimensions across will be 37ft. There is to be no tower; but it is finally intended to have a stone bell-cote on the west gable.

BIRMINGHAM.—The date of the formal opening of the new corporation meat market and slaughter-houses in Bradford-street has now been definitely fixed for Wednesday, the 27th inst. The ceremony will be performed by the Lord Mayor. The members of the Birmingham Clerk of Works and Builders' Foremen's Association visited the new meat market on Saturday afternoon, and were conducted through the building by the clerk of works and the foreman (Mr. Todd). The members were pleased with the interior of the market, and especially with the novel and ingenious arrangements for the slaughtering of the cattle. At the conclusion of the visit a vote of thanks was accorded to the architects (Messrs. Essex, Nicol, and Goodman) and the builder (Mr. John Bowen) for their permission to visit the market, and to the clerks of works and foreman for their explanations of the various parts of the building.

MIDDLESEX HOSPITAL.—It has been decided to considerably enlarge and partly reconstruct the existing buildings of the medical school amalgamated with this hospital. The plans for the new school have been prepared by Mr. Keith D. Young, F.R.I.B.A., and will necessitate the pulling down of part of the buildings on the west face of the hospital garden. The museum will be untouched, as will be the large lecture theatre. The new block will contain two wings set at right angles and facing respectively the hospital garden and Union-street. The latter site, with a frontage of some 80ft., has been acquired for the purpose of the extension. The new garden block will contain on the ground floor a complete chemical department, consisting of lecture theatre, chemical laboratory and lecturer's room, and private laboratory. On the upper floor will be housed the Pathological department, consisting of a large laboratory, which can be used for lecture purposes, and of a bacteriological laboratory and lecturer's room. This department will be in direct communication with the post-mortem department. The basement and ground floor of the new Union-street block will be occupied by the physical laboratory and by the physiological department, whilst the whole of the upper floor, some 120ft. long, will be occupied by the dissecting-room and anatomical classroom. The work is already

commenced, and the new school buildings are to be ready for use next year.

PORTRILL, WOLSTANTON.—About twelve years ago a new church, dedicated to St. Andrew, was erected at Porthill, near Wolstanton, Staffs, to provide accommodation for the population residing in that part of the township, and in view of the rapidly-increasing population consequent upon the opening out of the Watlands estate for building purposes. The new church gave accommodation for 400 people, and cost nearly £4,000. The addition of a southern aisle with transept, south entrance, and porch was left for future effort when the necessity for increasing the accommodation arose. This work has now been taken in hand. When the extension is completed, additional seating room will be provided for 106 persons, besides giving 50 more seats in the west end in the space hitherto used as a vestry. The extension will correspond in style with that of the original church, having Hollington stone dressings and Macclesfield parpint facings. The floor will be of wood blocks laid on concrete, and the passages will be paved with encaustic tiles. There still remains to be added to the church the upper part of the tower and a side chapel or vestry at the east end, when the church, which is on the main road between Newcastle and Tunstall, will be a complete example of the Early English style. The architects are Messrs. Wood and Hutchings, of Tunstall and Burslem (Mr. Wood being the architect of the original structure), and the contract, which amounts to £780, has been let to Messrs. Yorke and Goodwin, of Tunstall. The foundation-stone of the extension was laid on Saturday.

STECHEFORD.—The foundation-stone of the new church of All Saints, Stechford, near Yardley, was laid on Monday by the Viscountess Newport. The church will consist of a nave, north and south aisles, baptistery, chancel, chancel aisle, and vestry. The nave, including the baptistery, will be 87ft. long and 20ft. 2in. wide, the aisles 10ft. wide, and the chancel 30ft. by 19ft. The total length of the church will be 117ft. 3in., and the width across the body of the church 44ft. 8in. The church when completed will accommodate 504 adults. The eastern portion of the church and three bays of the nave are to be erected first. The west end, with tower and spire, will be erected as soon as funds will permit. The exterior will be of brick with terracotta dressings, the interior of brick with Bath stone dressings, the style being Gothic of the Decorated period. Messrs. Collins and Godfrey, of Tewkesbury, are the contractors, and Mr. J. A. Chatwin, of Birmingham, is the architect.

CHIPS.

The Local Government Board have sanctioned a loan of £4,200 to the local district council of Erpingham, East Norfolk, for the Mundesley waterworks.

Mr. Henry Ross, architect, Accrington, has been commissioned to prepare plans for the part first to be erected of the new technical school for Padiham, Lancs, the cost not to exceed £4,500.

The town council of Ipswich have consented to the proposal of the Great Eastern Company to greatly extend the system of their tramways.

Messrs. Beesley and Son have forwarded their estimate to the Epsom Rural District Council for the drainage of Cobham. The amount works out at £15,540. The matter has been deferred for a fortnight.

At the last meeting of the Glasgow Corporation, a recommendation to have the portion of Castle-street alongside the Royal Infirmary laid with Altracaz paving was adopted. The price to be paid the Alcatraz Company is 8s. per square yard—5s. when the work is done and 3s. at the end of four years, during which period the portion laid will be maintained by the company.

After some years' discussion, the Wimbledon District Council have finally decided upon an electric-lighting scheme for the whole of the parish. About 900 public arc-lamps will be provided, and 5,000 incandescent globes for private consumers, at an estimated total cost of £32,000. Application for a loan to cover the amount will be made to the Local Government Board. Mr. Arthur Preece has been appointed engineer.

A large villa three stories in height is about to be erected in Drummond-terrace, Crief, for Mrs. Murray. The following are the contractors: Mason, Mr. A. Crerar; joiners, Messrs. James Stothard and Sons; and slaters, Messrs. S. Drysdale and Son. The architect is Mr. R. Ewan, Glasgow.

Mr. Charles N. J. Oliver has been appointed Chief Commissioner of Railways for New South Wales in place of the late Mr. E. M. G. Eddy.

A Local Government Board inquiry was held at Broadstairs by Mr. Walter A. Ducat last week into an application by the Broadstairs and St. Peter's Urban District Council for power to borrow sums of £17,800 for a new drainage outfall and works, and £1,060 for the erection of public lavatories.

Several ornaments have been given to the Collegiate Church of Southwark, including a metal choir screen, a pair of silver altar vases, and a silver altar cross.

The Secretary of State for India has accorded sanction to the construction of a bridge of 56 spans of 150ft. over the Godavari River at Rajahmundry at an estimated cost of 5,969,718 rupees.

Satisfactory progress continues to be made with the new post office in Meadowside, Dundee. The roofing of the main buildings is now practically completed, and the builders are engaged in carrying up the north wall of the sorting office. The foundations of the sorting office are completed. The joiners are now at work in the interior of the building.

Mr. Walter A. Ducat, Local Government Board inspector, held a public inquiry at Ramsgate last week relative to the application of the town council for sanction to borrow the sum of £20,500 for gasworks purposes; and also £12,875 for the purchase of a land adjoining Princes-road, the construction of a refuse-destructor and depot, making of new streets, &c.

Brussels is to have a permanent memorial of the Diamond Jubilee in the addition of a chancel to the edifice of Christ Church, of which the first stone was laid by her Majesty's representative, Sir Savile Lumley, afterwards Lord Savile.

An interesting gathering took place on Monday in the Council Chamber, York, for the purpose of doing honour to Ald. Sir Joseph Terry, the "father" of the York Council, by presenting him with a life-sized portrait in oils. The portrait represents Sir Joseph in his robes as Lord Mayor, an office which he held on four occasions. The picture is the work of Mr. George Fall, of York, and is to be permanently hung in the council chamber.

At a meeting of a sub-committee of Edinburgh Town Council on Monday, it was resolved to recommend that designs should be asked for the erection of a memorial of Wallace and Bruce, the cost to be defrayed from the Hugh Reid bequest, which has now at its credit a sum of about £3,000. It is suggested that the statues of the heroes should be placed on two of the pedestals of the North Bridge, and that on the other two pedestals there should be erected the statue of John Knox at present in the quadrangle of the New College, and one of Burns, to be provided at the expense of the corporation. The Lord Provost's committee of the town council has adopted the former proposal, but have postponed decision as to the Knox and Burns statues.

At the half-yearly meeting of the Court of Governors of Owens College, held at Manchester on Tuesday, it was announced that Mr. R. C. Christie had offered £50,000 for the erection of a College Hall. The chairman also announced that two anonymous friends of the College had offered a sum of £10,000 for the erection of suitable buildings for the physical laboratory of the College, and a further sum of £5,000 towards its maintenance. A third gift was announced, Mr. Edward Holt, a member of the Manchester City Council, having given £1,500 towards the cost of the newly-erected gymnasium. The Governors passed resolutions accepting the gifts and thanking the donors.

In the theatre of University College, Gower-street, on Tuesday, a numerous company assembled to witness the presentation of awards obtained by the students during the past year, at the examinations in connection with the Faculties of Arts and Laws and Science Classes. Mr. J. F. Rotton, the treasurer, presided and distributed the prizes. The Dean's Report stated that the past year had been a notable one, and that the Government had increased the annual grant to the college from £1,700 to £3,000. The college had benefited during the past session by the trust funds in connection with the Pender Memorial to the extent of £5,000, and the Chadwick Trust, the trustees of which decided to found a chair of municipal engineering.

A large block of buildings being erected in Virginia-street, Liverpool, for the Shore Porters is making good progress. The building, which will be six stories high, has a frontage to Virginia-street of 92ft. and 85ft. to Shore-lane. This corner block is intended to be used for bonded stores and warehouse purposes. From the base to the first floor the front is of rustic ashlar, and above that hammer-blocked, and on the west wing there will be a turret rising from the third story. Mr. Alexander Cheyne, Ashley-road, Liverpool, has the contract for the mason work.

Engineering Notes.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—The 24th voluntary pass examination of candidates for the offices of municipal engineers and surveyors to district councils, carried out by this association, was held at Birmingham on Friday and Saturday. Twenty-one candidates presented themselves for examination, the written portion of which was taken on the first day. The greater portion of Saturday was occupied with the *vivâ voce* section of the examination. The examiners were: (1) For engineering as applied to municipal work, Edward Pritchard, Birmingham (past president); (2) building construction, A. M. Fowler, C.E., Manchester (past president); (3) sanitary science, J. Lemon, M.Inst., Southampton (past president); (4) municipal and local government law, J. T. Eayrs, Birmingham (past president). Mr. Pritchard acted as superintending examiner.

PROPOSED WEST RIDING EXTENSION OF THE MIDLAND RAILWAY.—The Midland Railway Company's engineers and solicitors visited Halifax on Tuesday to confer with the Corporation and Chamber of Commerce in regard to the proposed extension of the Midland line in that district. The company propose to branch off from their main line at Royston, between Normanton and Sheffield, and to make then for Thornhill. Here there would be a fork, one line running through the Spen Valley to connect with the Midland again at Bradford, while the other line would pass round by way of Huddersfield and Elland to Halifax. The station at Halifax would be for a time the terminus of this extension. But it is understood that a further extension might eventually be added north from Halifax, thus obtaining a still more direct course north and south than the Spen Valley route would give. The Midland Railway Company will seek power in the ensuing session of Parliament to proceed with these extensions.

CHIPS.

A new town hall is in course of erection at Conway. Mr. T. B. Farrington, borough surveyor, is the architect, and Messrs. Thorp and Son, of Llandudno, are the contractors.

The sanitary committee of the Middlesbrough Corporation have decided to construct an 8ft. sewer at a cost of £10,000, with the object of more efficiently draining the marsh district.

The three great asylums belonging to the county of Lancaster are so overcrowded that it has been decided to build a fourth, almost equal in size to those already existing. This new institution will be situated at Winwick, near Warrington. The contract for the building has just been given to Mr. Robert Neill, of Manchester, for £253,000. The electric lighting will cost a further sum of £14,000.

For building the new church of St. Matthew at Chapel Allerton, near Leeds, the tender of Messrs. Stephen, Bastow, and Co., of Bristol, has been accepted at £13,276. Mr. G. F. Bodley, A.R.A., of Grey's Inn-square, W.C., is the architect.

At a meeting of the City Commissioners of Sewers on Tuesday, a large deputation of owners of property, inhabitants, and others interested in the trades carried on in Thames-street and adjacent thereto, waited upon them to urge the importance of at once widening Lower Thames-street between Fish-street Hill and Botolph-lane. The roadway between Fish-street Hill and Botolph-lane is only 16ft. wide, and the traffic has been recently augmented by the widening of other parts of Thames-street, the opening of the Tower Bridge, the increase in the supply of foreign fruit, and the large numbers of holiday folks going to the various steamers and pleasure-boats. The traffic might be doubled by the removal of 15 old houses. The improvement might be effected at once. The memorial was referred to the Finance and Improvement Committee for consideration.

The parish church of Newburn is being restored from plans by Messrs. Hicks and Charlewood, of Newcastle-on-Tyne. A new porch, with massive walls of undressed stone, is being erected at the south entrance, a vestry has also been added. Internally, a new reredos of oak panels with Caen stone columns has been introduced, and the church has been paved with marble. The carved wood-work in the interior has been executed by Mr. Ralph Hedley, Newcastle, the marble by Messrs. Beall, of the same city, and the carved stone figures by Messrs. Milburn, of York, the marble floors by Messrs. Emley, Newcastle, and the paintings by Messrs. Bacon Bros., of London.

On Tuesday Sir Redvers Buller, as lord of the manor, will lay the foundation-stone of the new church of Emmanuel, which is to be erected in Okehampton-road, Exeter.

The Chiswick Urban District Council received on Wednesday from Mr. A. Sanderson, of Chiswick, a letter intimating his intention of making to the district a free gift of No. 1, Duke's-avenue, for the purposes of a free public library. The property consists of a large modern-built mansion, containing a number of lofty and commodious apartments. The council accepted the gift with thanks.

St. Peter's Church, Sumner-street, Southwark, was reopened on Sunday week, after being closed for seven Sundays for painting and decoration. The work has been carried out by Messrs. Heaton, Butler, and Bayne. A screen has also been erected, designed by Sir Arthur W. Blomfield, A.R.A.

The dedication of a new stained-glass window in the west end of St. Alphege, Canterbury, in commemoration of the Diamond Jubilee, took place on Sunday week. Some fragments of ancient glass have been carefully placed at the bottom of the present window. In the small spaces at the head appear the two dates 1837 and 1897, and a representation of the Queen. Two of the lights are devoted to scenes in the life of St. Alphege, and the third depicts the scene of the meeting between Ethelbert and Augustine at Ebbs Fleet.

A new hall and institute were opened at Cwmaman on Monday. The building comprises reading-room, billiard-room, game-rooms, and library, and has cost over £3,000.

The Bristol Town Council on Tuesday, after a discussion lasting 3½ hours, instructed the Docks Committee to promote a bill in Parliament next session for constructing a new dock and other works at Avonmouth, at a cost of over a million and a half. The scheme provides for a dock of forty acres in extent with a depth of 30ft., an entrance lock 850ft. long, a graving dock 810ft. in length, and granary transit sheds, landing-stage, two piers in the Avon, &c.

A new Station Hotel has been erected at Pelaw near Gateshead, from designs by Mr. James W. Frazer, A.R.I.B.A., of 49, Grey-street, Newcastle-on-Tyne; the contractor being Mr. G. H. Hodgson, of Sunderland. The accommodation provided, besides the usual bar and sitting-room, is a dining-room, a billiard-room, and bedroom and sitting-room accommodation for visitors. Stabling accommodation is provided at the rear of the premises in a yard. The building faces, and is in close proximity to, Pelaw Station, and is carried out in red bricks with stone dressings, the two gables on the front being half-timbered.

The new Camberwell School of Arts and Crafts, which will be held in the Leighton memorial building presented to Camberwell Vestry by Mr. J. Passmore Edwards, will be opened at the end of October or beginning of November. It has not been possible at present for the London Technical Education Board to make any definite announcement as to the classes that will be held; but it is probable that special provision will be made for the art training of those who are engaged in the different branches of the building trade.

On Sunday the mosaic work and the alabaster dado on the east wall of the sanctuary of All Saints' Church, Aden-grove, Stoke Newington, were dedicated by the vicar. The work was designed and executed by Mr. Daniel Bell.

Crediton's memorial in commemoration of the Queen's reign has taken the form of a drinking fountain, which has been erected on a site given by General Sir Redvers Buller, the lord of the manor, situate at the junction of East-street and Charlotte-street. The fountain, which was designed and built by Mr. Hubert Berry, is of Yorkshire stone from the famous Robin Hood quarries. It is 9ft. high, and 8ft. 6in. wide at the base, and it has two drinking troughs for cattle, one for dogs, and there are cups for wayfarers. The fountain was inaugurated on Saturday by Sir R. Buller.

A new technical institution is commencing its work at Hackney this session. This is the Hackney Technical Institute at Cassland House, South Hackney, which has been started by the London Technical Education Board in connection with the education committee of the Hackney Vestry. It is hoped that, if sufficient funds are forthcoming, this institute may become the nucleus of a future polytechnic. The work of the institute is at present devoted entirely to the building trades, classes being provided in carpentry and joinery, painters' and decorators' work, plasterers' work, and plumbing.

The joint public health committee of Selkirk Town and County Councils have resolved to proceed with the erection of a joint hospital for infectious diseases for burgh and county at Milnshot Park, and offers amounting to £1,810 have been accepted. Mr. James Bartie, county surveyor, is the architect.

COMPETITIONS.

HARRISBURG, PENN.—All the plans received in the late abortive competition to secure an architect for the Pennsylvania State capitol to be built at Harrisburg have been returned to the competing architects. The protest of Governor Hastings against the action of the Commission in rejecting all the plans and calling another competition has been followed by the resignation of Professor Warren P. Laird, the representative of the Commissioners on the Board of Experts.

Many and various aids have been brought before the monumentalist and marble-worker to enable him to obtain a smooth surface free from scratches and a good finished appearance, where the lead combines with the marble, as in the case of leaded letters. "This," writes a correspondent, "is accomplished quickly and surely with the application of a well-known brand of soap and the ordinary polishing felt. The mason will find it a useful addition to his kit; but it 'won't wash clothes.'"

A new infants' school and classroom addition to the girls' school at Bitterne, near Southampton, were opened last week. The new erection, constructed on the south end of the Bitterne Church of England Schools, provides accommodation for 172 infants, while the girls' school has been extended so as to accommodate 66 more pupils. The infants' school is built of red brick, with slate roof. It measures 43ft. by 22ft., and the classroom 22ft. by 20ft. The girls' classroom is of white brick, in unison with the old buildings. The buildings have been constructed by Messrs. C. and A. Witt, of Bitterne, under the supervision of Messrs. Mitchell, Son, and Gutteridge, architects, of Southampton, at a cost of £1,050.

The Birmingham Board of Guardians on Wednesday resolved to proceed with alterations and additions to the block for male epileptics at the workhouse infirmary, at a cost not exceeding £1,600; with the erection of a new laundry at the cottage homes, Marston Green, and to the laying of water-mains at the homes, at a cost of about £1,050; and with the provision of a new dining-hall and storage accommodation at the workhouse, at an expenditure of about £2,300.

The new public halls just erected at Uddingston, N.B., were formally opened on Friday. The building is near the Caledonian Station, and comprises a large hall to seat 1,000, and a lesser hall to accommodate about 250. Besides, there are two cloak-rooms and two committee-rooms. Under the stage there are dressing-rooms and kitchen, and on the stage level a green-room. The total cost has been £3,500.

At their last meeting the city council of Coventry decided to raise the salary of Mr. Coddington, the manager of the sewage works, from £275 to £300 a year. They also agreed to purchase for £50,275 land at Baginton for the purposes of the new sewage scheme and disposal works.

As a permanent memorial of the Queen's Diamond Jubilee, improvements are being carried out at Berwick Infirmary, under the supervision of Mr. John L. Miller, architect. The new accommodation consists of two nurses' bedrooms, servants' double bedroom, bathroom for attendants, and the heating of the institution. The cost of the work will be nearly £500.

The corporation of Ipswich accepted, with thanks, at their last meeting the gift from Mr. J. Dupins Cobbold of 1½ acres of high-lying land situate on the old Racecourse, on the south-eastern side of the town, as a public recreation ground. At the same meeting it was decided to exchange 1½ acres of outlying land for 2½ acres adjoining the high-level reservoir in Park-road, and to take steps for building a new fire brigade station in New Bond-street in lieu of the existing one in Waterworks-street, the site of which will be absorbed into the water-works, now owned by the corporation.

There was considerable excitement at Barmouth on Friday in consequence of a Sheriff's officer having taken possession of the offices of the district council for a claim of £1,800 made by the contractors of the drainage works.

At the adjourned licensing meeting at St. Columb, last week, a provisional license was granted for a new hotel, to be built in front of Dennis House, Padstow. The architects are Messrs. Crickmay and Son, and one of the firm stated to the Bench that the estimated cost, exclusive of furnishing the interior of the premises, was £8,000.

A report issued by the town clerk of Blackburn shows that the following public works are to be undertaken for that town as necessity arises:—Tramway purchase and conversion to electricity, £100,000; sewerage, £38,000; recreation-ground, £12,000; markets, £28,000; municipal lodging-house, £17,000; wood-paving, £11,000; cemetery extension, £12,000; refuse destructors, £15,000.

Our Illustrations.

NEW BUILDINGS, LIVERPOOL.

THESE buildings are being built for Mr. Thomas H. Ismay, and are intended to be occupied in part by the well-known White Star Steamship Company. The site at the bottom of James-street, and fronting to the Goree Piazza, has a commanding view of the River Mersey, from which the building is an object of considerable importance, owing to its boldness of parts and its great height above the surrounding buildings. The materials are Aberdeen granite for the base, Edwards's red Ruabon brick facings, Portland stone dressings, and green roofing slates. The floors are fireproof throughout; the entrance-hall and staircase are faced with polished grey granite, and form a spacious and stately entrance to the various offices. There are two electric elevators, and arrangements are made for a mail-chute, with a letter-box on each floor. There are spacious vaults in the sub-basement, and on the upper floors there are toilet arrangements for both males and females on separate floors, with keepers' residences on the upper floor. The ground and first floors are handsomely fitted up for the White Star line in oak and walnut, a special feature being the rubber flooring in the main corridor, and the marble counters, with gunmetal and glass screens, inclosing the clerks from the main corridor. The works have been executed by Messrs. J. Henshaw and Sons, of Liverpool, under the supervision of Mr. Allen Lloyd, clerk of works. The architects are Messrs. R. Norman Shaw, R.A., and Mr. J. Francis Doyle; the drawing was exhibited at the Royal Academy.

ROOD LOFT, LIMOGES CATHEDRAL.

THIS work is dated 1533 A.D., and its detail is exceedingly refined and thoroughly characteristic of its period. The freedom of the boldly-treated scrolls flanking the central composition of this bay calls for special remark, with the spiritedly-modelled boys bearing torches. The same feeling is illustrated by the figure work in the pilasters, of which enlarged details are given in the accompanying drawing, to which a National Silver Medal was awarded to Mr. Rowland D. Rawcliffe, who made this study from the cast in South Kensington Museum.

"MOUNTFIELD," MEADVALE, REDHILL.

THIS house was built for Mr. Alfred Machin, from the designs of Mr. H. D. Searles-Wood, F.R.I.B.A., of 157, Wool Exchange, Colman-street, E.C., by Messrs. Bagaley and Sons, of Meadvale. The walls are of local red brick, the upper part of half-timber and rough-cast. The roofs are covered with Broseley tiles.

NEW BANKING PREMISES FOR THE LONDON AND MIDLAND BANK (COVENTRY BRANCH).

THE old banking premises belonging to the London and Midland Bank, and formerly the Coventry Union Banking Company, situated at the corner of High-street and Little Park-street, Coventry, have been pulled down, and new premises have been erected by Mr. Charles Haywood, jun., Coventry, from the designs of Mr. Frank Barlow Osborn, architect, Birmingham. The frontage to High-street is 30ft. and to Little Park-street 90ft. The new buildings, which have been designed in the Elizabethan style of architecture, are executed in Hollington stone and red bricks, and comprise, in addition to the banking premises, several suites of offices, situated on the ground, first, and second floors. The fine and spacious banking-room, which is 40ft. long and 34ft. wide, is arranged to accommodate 26 clerks, and is approached from a vestibule at the corner of the two thoroughfares. The internal fittings are made of polished walnut, and the bank counter, which is 32ft. long, is arranged to accommodate five cashiers. The manager's office faces High-street, and is so arranged as to be easy of access from the vestibule, banking-room, and private speaking-box; the vestibule is lined with glazed faience. The strong-rooms, which are very spacious and secure, are situated in the basement, a hydraulic lift being provided, communicating with the banking-room over. The remaining portion of the basement is appropriated to the use of store-rooms, lavatory, heating chamber, &c., the whole being executed in a thoroughly fire and thief-resisting manner. The banking premises are lighted by electric light. The total cost was about £10,000.

DESIGNS FOR BRONZE DOOR FURNITURE.

THE hinges, &c., illustrated, were designed with the intention of combining a fresh and decorative treatment with utility; first, considering the practical end to be gained, and then weaving into the construction as much appropriate symbolism as possible. The hinges are based upon the T-shaped arm, with branches above and below, which, gathered into a conventional mass, grasp and strengthen the timbers of the door, while, on analysis, the knocker presents the primitive form of a hammer, resting against a plate to receive its blows.—PHIL. W. SMITH.

"MISS CRANSTON'S," GLASGOW.

THIS pencil drawing, from the Royal Scottish Academy Exhibition, shows the vestibule of some business showrooms at Glasgow, in which some very richly-elaborated wainscot work has been carried out from the designs of the architect, Mr. G. Washington Browne, A.R.S.A. We have not been favoured with any particulars.

HOUSE AT NEWMARKET.

THIS house has recently been erected at Newmarket for Mr. E. H. Leach, the well-known veterinary surgeon. The house is faced with red bricks from Mr. Mark Gentry, Sible Hedingham, Essex. The windows have brick mullions, with red Mansfield stone heads, transoms, and sills. The roofs are covered with permanent green slates. There is stabling for eleven horses behind the house, with food-lofts, &c., over. Messrs. Heaton and Gibb, of Newmarket, are the architects, and the work has been carried out by Mr. A. J. Bateman, the contractor.

NEW PREMISES FOR MESSRS. J. ARNOTT AND CO., LIMITED, BELFAST.

FOR over fifty years the Belfast branch of the well-known firm of John Arnott and Co., Limited (Dublin, Belfast, and Cork), have occupied extensive warerooms in Bridge-street, and it is but natural that in the extending requirements of their business they should acquire the historic corner site, abutting on High-street, just adjoining their Bridge-street premises, and so obtain an entrance from High-street as an auxiliary to their other entrances. We present an illustration of the new buildings and extensions now in course of erection on this corner site, from the design of Messrs. J. J. Phillips and Son, 61, Royal Avenue, Belfast; the builders are Messrs. H. Lavery and Sons, of Cambridge-street, Belfast.

The three-light west window in St. Laurence's Church, Alycechurch, has been filled with stained glass as a Jubilee memorial, and was unveiled on Monday. Messrs. William Pearce and Co., of Bridge-street, Birmingham, carried out the work.

CHIPS.

The members of the Eastleigh Urban District Council have raised the salary of their surveyor, Mr. J. Evans, from £150 to £200 a year.

The Barrow-on-Soar District Council have instructed Messrs. Simpson and Harvey, architects, surveyors, and sanitary engineers, of Alliance Chambers, Leicester, to prepare an entirely new system of drainage for the parish of Birstall.

A stained-glass memorial window has just been placed in the chancel of the parish church of Haseley, Warwick, the subject being the visitation of the Virgin Mary to Elizabeth. The work has been carried out by the firm of Hardman and Co., Birmingham.

Sewerage works are in progress at Princetown on the summit of Dartmoor. For nearly 20 years a scheme has been in contemplation by the Duchy of Cornwall, Local Government Board, or Prison Authorities, all of whom are interested in the question. Plans have now been prepared by Mr. Bellamy, of Plymouth, which have obtained the approval of all parties. The contractor is Mr. E. Duke, of Plymouth, who has already a strong body of men at work. The work on the prison property will be done by the convicts. The cost of the whole scheme will be nearly £3,000.

At Annersley, where the extension of the Great Central Railway to London will effect a junction with the existing system of the company, progress is being made with large sorting sidings, and a number of men are actively occupied in the erection of an engine-shed of large proportions. A signal cabin has been opened at the point where the London extension actually commences. At the Nottingham Central Station excavations at present occupy nearly the whole attention of the contractors. Substantial progress has been made with the steel work of the Parliament-street bridge at Nottingham. The stations at Ruddington and East Leake are approaching completion.

An ornamental drinking fountain will be erected in the Diamond at Clones in honour of her Majesty's Diamond Jubilee. The fountain will be 12ft. in height, and 6ft. wide at the base. It consists of an octagonal base, with eight columns, above which are eight semi-circular arches, with cusps. On these arches are eight shields, with devices on each shield. The whole will be surmounted with a dome and ornamental finial. The contract for the fountain and its erection has been intrusted to Messrs. M'Mahon and Gray, Clones.

On the summit of a hill, known as How Tallon, Yorkshire, nearly 1,500ft. above sea level, a barrow has been opened, and some discoveries made. The barrow is 60 yards in circumference and 6ft. high. A quantity of human bones, a stone cist, four flint arrow-heads, and a flint scraper were found in the portion dug into. One of the arrow-heads was barbed, the others leaf-shaped, and the edges are serrated. A small pottery urn, with a worked pattern upon it, was found interred with the remains of one human body.

The contractors (Messrs. J. and W. Lowry) in demolishing some old buildings behind Collingwood-street, in Newcastle-on-Tyne, to make way for the erection of a new block of offices, have come across a very large number of dressed and wrought stones, which have evidently formed part of some ecclesiastical structure at present unidentified, and, indeed, the old stable-walls would appear to have been almost entirely built from the remains of some previously demolished church. The mouldings bear evidence of belonging to various periods, from Early English to Late Decorated.

For three centuries there existed over the monument of Cardinal Pole in Canterbury Cathedral a representation of the arms of the late Prelate, supported by two angels, and, the escutcheon being historically interesting, the late Canon Jenkins proposed before his death that these arms, which contained sixteen quarterings, some of them of families which have since become extinct, should be repainted. It is this work which Cardinal Vaughan and the other Roman Catholic visitors of a fortnight since have undertaken to provide funds for, as a recognition of the kindly welcome and courtesy extended to them. The tomb will be left exactly as it is, simply being enriched by the reproduction of the arms.

The parish church of Bothwell, N.B., is about to be restored from plans by Dr. Rowand Anderson, of Edinburgh. At the same time, the buildings facing Main-street, at present obstructing the view of the church, will be removed, and an entrance gateway will be provided at the west end of the grounds, with gate, lodge, and conservatory, also inclosing the grounds there with parapet-wall and railing. In addition to this, it is proposed to erect a monument to the memory of Joanna Baillie, daughter of Dr. Baillie (minister of Bothwell parish in 1762), the well-known poetess and dramatist. The monument is to be of brown-buff terracotta, will stand about 16ft. high, and have four faces, panelled, enriched, and suitably inscribed.

ARCHITECTS

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

DUNDEE INSTITUTE OF ARCHITECTURE.—The annual report of this institute states that the number of members remains as last year, 45, and also that of honorary members at 10, whereas, of the associates, one died and 15 have resigned, leaving a total of 123. The finances are in a healthy state, the balance in hand being £29 10s. 6d., the total expenditure being under £90. A feature of the report is that full abstracts are given of the various addresses delivered before the members during the past season.

THE GLASGOW INSTITUTE OF MEASURERS.—The seventeenth annual meeting of the Glasgow Institute of Measurers was held in the Building Trades Exchange, Glasgow, on Monday, Mr. Colin Young, I.M., president, in the chair. The annual report of the council was submitted. The funds of the institute amount to £289 12s. 9d., an increase of £13 0s. 1d. during the year. The successful competitors in the professional examination for assistants and apprentices, conducted by the council, were present, and received their prizes and certificates. A grant was made (as in previous years) to the Technical College for prizes in the architectural and building construction classes. The office-bearers for the ensuing year are:—President, Colin Young; vice-president, John Currie; secretary and treasurer, Thomas N. Hill, F.S.I., 180, Hope-street; auditors of professional accounts, John H. Ramsay and John Muirhead; other members of council: Robert Reid, G. B. Walker, James Cameron, Archibald B. Watson, James D. Herbertson, John Baxter, John H. Allan.

LIVERPOOL ARCHITECTURAL SOCIETY.—The first ordinary meeting of the fiftieth session of this society was held at the Law Library, Union-court, on Monday evening. A large number of members attended. Mr. W. E. Willink, M.A., president, in his opening address, contrasted the population and buildings of Liverpool fifty years ago with the present time. Liverpool in 1848 was not what she will be in 1898. Then the total number of her inhabitants was well under 353,000, not much more than half of the present population. The buildings of the town, public and private, showed little of the affluence which was so evident in the streets of to-day. The number of men who appeared in the directory under the heading "architects and surveyors" was then 85—now it was 240. He urged upon the students—study. No good work was done by ignorance, and bad work was not likely to be the result of the humble and conscientious examination of great work of the past. Whatever they studied, let them study to develop the artistic conscience, that faculty of criticising their own work by the application of unvarying standards, by which alone they could enjoy the conviction that, whatever their faults, they were on the right lines. A vote of thanks was proposed by Mr. T. D. Barry (one of the founders of the society) and seconded by Mr. George Bradbury.

PERTH ARCHITECTURAL ASSOCIATION.—This association was formed last Wednesday week, and the following office-bearers and committee appointed:—President, Mr. George P. K. Young, A.R.I.B.A.; vice president, Mr. Robert J. Gildard; secretary, Mr. William M. Page; treasurer, Mr. John S. Jarvie; committee, Messrs. Wilson, Dan A. Stewart, John Anderson, and Thomas McLaren. It is intended to have classes in design, construction, &c., for the students under able leadership, with monthly lectures, and the session opens in a few weeks' time with a lecture by some prominent architect, by which time also a complete syllabus will be drawn up.

SANITARY INSPECTORS' ASSOCIATION.—The annual meeting of the Sanitary Inspectors' Association was held on Saturday evening at Carpenters' Hall. Mr. W. W. West, of Walthamstow, presided. The annual report showed that there were 583 members on the books. The Institute of Certificated Sanitary Inspectors had thrown in their lot with the association. As the Superannuation Bill, intended to help the members, in conjunction with other public servants, had not met with the success expected, the council had decided to take the necessary steps to have the measure framed by the association reintroduced, in the belief that the claims of the association would be conceded by Parliament. In this connection the council expressed their pleasure in acknowledging the continuance of the policy of the Local Government Board, in urging

local authorities to appoint their inspectors permanently. Owing to the death during the year of the president, Sir B. W. Richardson, Sir John Hutton had been elected to fill the vacancy. The invitation to hold the provincial meeting next year at Newcastle has been accepted. On the motion of Mr. Dee, seconded by Mr. Gardner, of Worthing, the report was adopted. The financial statement indicated that there was a small balance in hand. Mr. T. G. Dee, of Westminster, then took the chair as the elected chairman of the council for the coming year. In alluding to the Maidstone epidemic, the chairman said he thought the case of that town only showed that where there was no Government analysis of the water supply of a town, the sanitary inspector should be empowered to see that water companies supplied a pure article. The question of the admission of lady members to the association was adjourned.

SOCIETY OF ENGINEERS.—At a meeting of this society, held at the Royal United Service Institution, Whitehall, on Monday evening, Mr. G. Maxwell Lawford, president, in the chair, a paper was read by Mr. James Croll, entitled "Filter Presses for Sewage Sludge." The author first referred to the filter press as being the most commonly adopted method for reducing the moisture contained in sewage precipitation works, and then described the two methods of introducing the sludge into the machine. He next described the filter-pressing machinery at the works of the Richmond Main Sewerage Board. This consisted of six filter presses and appliances for the direct forcing and the air-pressure systems. The advantages and disadvantages of the different processes were discussed, together with trials of the various filtering materials, lime, &c.

CHIPS.

The newly-restored Protestant church at Cronberg, near Friedrichshof, was consecrated on Wednesday week, in the Empress Frederick's presence.

Mr. T. Honess, owner of three houses in Beresford-street, Walworth, was summoned to the Lambeth Police-court on Friday for neglecting to comply with an order of the court to carry out certain work on the property. For the defence it was stated that the houses were to be sold, and that the holidays had caused delay in completing the sale. The magistrate ordered the defendant to pay a penalty of £30 and costs.

The harbour trustees of Dundee have adopted a report by Mr. Buchanan, their engineer, recommending that the wall at the Eastern Cattle Wharf be reconstructed at a cost of £9,000, the wharf having recently shown symptoms of moving forwards towards the river.

At Grange-over-Sands a public hall is about to be added by subscription to the offices for the urban district council to be erected on the site of Laurel Bank. The public room is to be 70ft. by 30ft., and will accommodate 500 persons, with an ante-room 21ft. by 11ft. 6in., dressing-rooms and a cloak-room. A gallery can be added afterwards if desired. The total cost will be £1,380. The plans have been prepared free of charge by Mr. Ward, a local architect.

The Earl of Dumfries, elder son of the Marquis of Bute, accompanied by his brother, Lord Ninian Crichton-Stuart, performed the ceremony of laying the foundation-stone of a new Roman Catholic church at Mountain Ash. The church is situated near the main road between Mountain Ash proper and the village of Penrhiwceiber. The architect is Mr. Bernard Smith, F.R.I.B.A., Gray's Inn-square, London, and the contractors are Messrs. Collins and Godfrey, of Tewkesbury. It is estimated to cost over £3,000, of which sum £1,600 is now in hand.

The resignation of Mr. H. Percy Boulnois, city engineer of Liverpool, was submitted to the health committee of the corporation on Thursday in last week, and was accepted with much regret. It is understood that Mr. Boulnois has decided to enter into private practice in London as a consulting engineer.

Some 20,000ft. of tallow wood have been forwarded from Grafton, New South Wales, to the order of the Lancashire and Yorkshire Railway Company. Orders are in course of execution for other English railway companies.

The scheme for the decoration of the interior of the Royal Exchange is rapidly approaching completion. The ninth picture—that presented by Sir Samuel Montagu, Bart., representing Charles I. demanding the surrender of the five members at the Guildhall—is almost complete, and will be unveiled by the Lord Mayor very shortly. It is from the brush of Mr. Solomon J. Solomons, A.R.A.

Mr. John Kelley, building inspector of Boston, Mass., died in that city on September 19.

The formal opening of new union offices at Leigh took place yesterday. The cost of the extensions, which comprise offices, boardroom, tram wards, and laundry, has been about £12,000.

The members of the Dublin branch of the National Association of Operative Plasterers held their first annual dinner in the Burton Restaurant, Duke-street, Dublin, on Saturday evening. There were seventy seated to dinner. The toast of the "N.A.O.P." was proposed by the president of the branch, Mr. Joseph Kelly, and was responded to by Mr. J. D. Hopwood and Mr. Thomas Snythe. The toast of "Our London Brothers" was acknowledged by Messrs. Allwood and Lindo. After the toasts were drunk a concert was held in the billiard-room.

Burlington Baptist Chapel, London-road, Ipswich, has been reopened after the execution of internal repairs, alterations, and decorations, the work including the rearrangement of the gas-fittings, the provision of incandescent burners, and the substitution of cathedral for quarry glass in all the windows. The works have been carried out from plans by Messrs. Eade and Johns, of Ipswich, by Messrs. Stearn and Son, of the same town. At the same time the organ has been altered and enlarged by Messrs. Bishop and Co., of London. The total outlay exceeded £600.

At the last meeting of the City Court of Common Council, the town clerk read a letter from Mr. Edwin Lawrence, M.P., offering to present to the corporation a portrait—presented by the Ward of Walbrook—of his brother, the late Alderman Sir J. Clarke Lawrence, and also a picture, given to him by the King of the Belgians at the same time as that presented to the late Mr. Alderman Besley, and now the property of the corporation. The Rev. R. H. Hadden also offered, on behalf of the subscribers, the memorial portrait, by Mr. A. C. Cope, of the late Prebendary Rogers. The gifts were accepted, with thanks, and it was stated that Lord Rosebery would unveil the Rogers portrait early in December.

The Government laboratory has been removed from Somerset House to new buildings in Clement's Inn-passage, Strand, which were opened last week. Of the 38 rooms, the largest is devoted to the staple function of testing and estimating the alcoholic strength of the exciseable liquids, and is fitted up with retorts, electric agitators, and evaporating chambers. A polariscope room adjoins the chief laboratory, and a cold storage-room close by is kept at the requisite low temperature by a brine-producing engine. A photographic room has the Röntgen rays apparatus fitted up for use, and another laboratory is devoted to bacteriological work and water analysis. The building has been constructed from plans prepared by Dr. Thorpe, the principal chemist, and put into shape by Sir John Taylor, K.C.B., of H.M. Office of Works, under whose directions the laboratory has been erected. It consists of three floors and a basement, and accommodates about a hundred workers.

The death took place on Friday of Alderman William Chadwick, of Heywood, at his daughter's residence, in Manchester. The deceased, who was in his 70th year, was one of the best-known men in the district. Originally a weaver, he became the first lamplighter in the district, but afterwards amassed wealth as an auctioneer. At one time he was partner in an extensive building business. A staunch Radical, and in early days a Chartist, he represented his party on the old local board, and, since the town was incorporated, on the town council, having been three times elected an alderman.

Messrs. Garrett and Haysom, of East-steet, Southampton, have recently completed, for erection in the Roman Catholic Cathedral at Demerara, a tablet to the memory of a late official of the Royal Mail Company, Mr. Maguiness, subscribed for by his fellow officers. The tablet has been executed from a design by Mr. J. D. Haysom. It is carved in statuary marble, on a red marble background, and takes the form of a shield, with oak and laurel springing from behind it.

A meeting was convened at Castletown, Isle of Man, on Thursday in last week, of employers of labour interested in the building trade of Castletown, with the object of forming a Masters' Association. Only seven employers turned up, and, after some discussion, a committee was appointed to wait on the absent employers and ask them to join the association if one was formed. The meeting was adjourned to receive the committee's report.

The Library, Museum, and Arts Committee of the Liverpool Corporation have decided to accept the tender of Messrs. Joshua Henshaw and Sons, for the erection of the museum extension and the technical schools on a site running from the present museum to Byron-street, at a cost of £89,224. The work is to be carried out from the designs of Mr. E. W. Mountford, F.R.I.B.A., of London, which were selected in competition.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—S. B. W.—R. J.—T. F.—M. H. and Co.—C. H. S. (Dudley).—G. P.

Correspondence.

"TEAK" AGAIN.

To the Editor of the BUILDING NEWS.

SIR,—I have not the numbers with me for reference, but I remember that there are contained in the letters of two of your last correspondents statements that teak is not oily because it is gritty, and that it must not be fastened with iron, because both iron and teak will rapidly decay in contact.

The popular idea of teak is that it is very hard. That is not so: it wears under attrition as much as would the best dense yellow deal, taking, for instance, Dantzie deals as a standard. When worked and shaped to use it does not crack or shake, and it keeps its shape without warping; but is not difficult to split if it is desired so to use it. It is about as hard as black walnut. Probably, the reason why it is thought to be so hard is that it resists the attacks of both fungus and worms, its secretions being acrid and bitter, and relished by neither. It is also difficult and expensive to work, not because it is hard, but because it contains in its pores the so-called "grit" which turns the edges of the tools. Although not of excessive hardness for wear under foot as in stair treads, it has the advantage of giving good safe foothold and not wearing slippery; this, probably, also on account of the filling of the pores referred to. I have been talking the matter over with a builder who was, twenty years ago, a shipwright-carpenter at Blackwall, and his idea is that the so-called grit is a very hard gum or resin, which fills the pores, and which, when attacked by the tool, granulates into minute hard particles, so making the wood difficult to work, much in the same way as is shown in some kinds

of hard, dry pitch-pine, to the condition of which some saw-mill men apply the term "brassy." But, whatever is the cause of the "grittiness," it is a fact that the wood is both oily and gritty. One of your correspondents appears to wish to imply that if the wood is gritty it cannot be at the same time oily;—there he is in error, there is nothing incompatible in the simultaneous existence of the two conditions.

As to the decay of teak and iron in contact, I should like to read more definite particulars. What does your esteemed correspondent Harry Hems say? At first I thought that this must be the effect of the wood and metal in contact in presence of sea-water; but my shipwright friend knows nothing of such a result, and does not believe it. He was engaged about twenty years ago in the building of the *Kaiser* warship for the German Government, and the *Independencia* for the Italian Government. In those vessels, built by Samudas and Dudgeons respectively, both firms of eminent shipwrights with great experience of teak timber, the vessels were built of iron ribs with $1\frac{1}{2}$ in. iron plates. Iron armour was attached outside with teak packing under from 7 in. to 14 in. thick, and the inside was lined with $1\frac{1}{2}$ in. teak boarding, and both boarding and packing were attached to the iron by means of iron bolts.—I am, &c., W. R.

ON THE USE AND ABUSE OF THE OPEN CHANNEL IN SANITARY DRAINAGE.

SIR,—The open-channel, straight and curved (both semicircular and $\frac{3}{4}$ -round in section), as now made in beautiful glazed ware, is of the greatest value, both for the bottoms of man-holes to convey sewage, and also above ground for rain water and clean waste conduits; but, directly it is used above ground for carrying greasy or impure wastes, as from urinals, it becomes an intolerable nuisance, only rendered less in degree by constant attention and cleaning, in itself an insanitary and disagreeable operation.

The leading feature in all true sanitary work is to reduce all fouled surfaces as much as possible, and the man who makes a scullery sink or a urinal discharge into a long open-channel, which in turn discharges into a gully, shows either his ignorance of, or contempt for, the above-mentioned canon of sanitation. Curiously enough, this insanitary practice is asked for in two such dissimilar and divergent districts as Croydon, which owes so much of its healthfulness and repute to sanitation, and Cambridge, which, to put it mildly, does not come up to the Croydon standard.

It is too often overlooked that this bad custom is simply a relic of barbarism. In the days of our grandfathers such waste-pipes were either directly connected with drains or made to discharge untrapped over traps (too frequently "bell-traps.") Any smell arising in, or from the trap then promptly passed up the waste-pipe; but, in these more civilised days, a smooth-drawn lead trap is fixed immediately under the fitting, the waste-pipe of which then discharges into a circular self-cleansing gully outside the house. No smell from the gully can pass up the waste-pipe, and the introduction of a long or short open channel, with the object of preventing a thing which is already impossible, is a work of super-erogation as well as an evil.

Recently, I have had to alter the drainage of an important institution where a tremendous amount of cooking is done, and consequently a vast quantity of grease accumulates, or, I may now say, used to accumulate. I found the scullery sinks discharging into open glazed channels with much splashing and fouling of channels, walls, &c. Not satisfied with this large and entirely unnecessary fouled area, the authors of the scheme had caused these channels to discharge their offensive contents into large rectangular grease-traps which retained the grease upon the premises, and the sour smell of the putrifying grease in these channels and traps pervaded the place, the grease offending the eyes and the stench the nose; in fact, sickness and sore throats were attributed, no doubt justly, to the horrid effluvia.

All this has been swept away. The sinks now discharge properly through ventilated and trapped lead waste-pipes (with expansion joints) into circular flushing-rim gullies in the open air, and large automatic flush-tanks discharge through flushing pipes of ample area into these gullies at sufficiently frequent intervals to break up all the grease and sweep it through and out of the drainage system without trouble or attention. All smell

has been removed simply by reducing fouled surfaces to a minimum.

This is only another proof, among many, that this old-fashioned and sanitariously bad requirement should be removed from sanitary by-laws.—I am, &c., CHAS. E. GRITTON,

A.M.Inst.C.E., Mem.Soc.Architects.

IRISH AND ENGLISH ARCHITECTS.

SIR,—You note in the last issue of the BUILDING NEWS, an animated controversy *re* bells for St. Patrick's Cathedral being obtained from England, which has called forth a letter from an Irish architect, naming English architects now doing work in Ireland. To those acquainted with the majority of modern architecture in Ireland it will be welcome news to hear that such men as Sir A. Blomfield and W. D. Carie are among those adding to the architecture of Ireland. Of course, it is not to be presumed that there are no able architects in the country. There are several who will equal the English architects, and their work is a credit wherever seen; but, on the other hand, there are some whose work, to say the least, might be improved by many pupils of one or two years' training, and yet some of these men are doing the greater part of the work there. It is a well-known fact, too, that a great deal is done by English draughtsmen and "ghosts," few of the leading offices being without their English assistant; in fact, I know of several architects who will not have their own countrymen as assistants, and always go to England if in want. The necessity is well known by those acquainted with Ireland, and Mr. Thomas Drew, the president of the Royal Institute of Architects of Ireland, has drawn attention to the fact that, if they want any extra help, the backwardness of Irish assistants necessitates them sending their work to England to be done. It is not, however, to be presumed by this that there is plenty of chance for English assistants; on the other hand, there is a necessity for such a caution as was seen in your advertising columns some 18 months ago. Concerning the importation of English bells, we know there is always a shouting when opportunity is giving against anything English; yet I know Irish architects who always (or nearly so) go to England for various work, not only bells, for their Catholic churches. What is to be done if Irishmen won't keep up to the times? Their own countrymen are not likely to send the orders to England if obtainable in their own land, especially for their own churches.—I am, &c.,

GOTH.

POOR MORTAR.

SIR,—If your correspondent "H. C. S." will tell "his" readers why air is in a pulverulent state when freely exposed to lime, he will "have something to say worth occupying your space with." In the course of forty-five years' intimate connection with building operations and building operations, the term "oxide of lime" has never once been applied to lime by chemists or non-chemists in my hearing. Your correspondent misses the point of my letter to you—it was merely to plead for accuracy and simplicity in the use of scientific terms when describing materials used in building, and their inter-action one with another. "H. C. S.," for instance, applies to a common well-known substance the names "lime," "oxide of lime," "calcic oxide," "oxide of calcium," and "CaO," all in a few lines. If "H. C. S." writes for people who are already well acquainted with the subject this does not matter; but if for students or the general public, then, applying so many different names to the same substance may lead to confusion. With reference to the closing paragraph of Mr. Busbridge's letter, it is probable that the Romans kept their lime moist in covered pits. Like most others engaged in building, the writer had an idea that lime once set was useless as a cementing material. Experiment showed this notion to be false; for lime, which had been made into putty and allowed to set—that is, to get quite dry and hard—was stronger when pounded up and made into mortar the second time. Briquettes, lin. square in section, carried only 8½ lb. after a month in the first case, whilst, in the second case, the briquette sustained a weight of 13½ lb. before fracture.—I am, &c.,

W. E. M.

The death was announced on Friday of Mr. John Fail, of Messrs. A. and J. Fail, contractors, Glasgow. He had been in business for over forty years, and his firm laid all the tramway lines in Glasgow.

Intercommunication.

QUESTIONS.

[11796.]—**Rough Cast.**—It is desired to have a portion of building done in rough-cast plastering of a good rich chrome colour. How is this done, and how should it be specified, and with what proportions?—W. C. DE B.

[11799.]—**Woodwork of Windows.**—Will some reader inform me which way to take out quantities for painting the woodwork of windows?—STUDENT.

[11800.]—**Ink.**—Several ink perspectives which I have lately seen had a moist appearance, as if the ink were still wet. Can any of your readers inform me how this effect is produced—whether it is by a special kind of ink, or by a wash laid on when the ink is dry?—A. INGLIS.

[11801.]—**Essex.**—Can any of your readers inform me which is the best local stone and facing brick for a large building near to Shoeburyness?—INQUIRER.

[11802.]—**Flashings.**—I should be glad to know the advantages and disadvantages of the two methods (A and B) of flashing the side of a chimney head. The former is

generally used in Scotland, and the latter quite common in the South of England, but with lead soakers underneath the slates or tiles. What is the full definition of the term "flashing"? Does the apron constitute a part of the flashing, as all the flashings are not specified to have aprons? Should a flashing ever be without an apron? If so, in what position?—GALLATOWN.

[11803.]—**Surveyor's Chains.**—I would feel much obliged if some of your readers would inform me where to obtain 100ft. surveyor's steel chain, and what would be the price? Each link 1ft. in length. Chain to be used for railway line.—ROMEO.

[11804.]—**Building Construction.**—I wish to know the best books to use for Honours stage (S. and A.) Building Construction? I know of Rivington's; but it is not sufficient to answer questions on architecture, sewerage, plumbing, &c.—HONORIS.

[11805.]—**Fireproof Plaster.**—Will some reader kindly give me any particulars of a material that will not crack or crumble or peel if exposed to great heat? Is the "Asbestic" suitable, and how can I use it?—TYRO.

[11806.]—**Fixing Marble Slabs to Inside Walls.**—Which is considered the best way of fixing marble in thin slabs to a new brick wall? Are there any precautions necessary to prevent fracture in case of the settlement of the brickwork? I should be glad to have any advice.—A. H. R.

[11807.]—**Bath and Sink Wastes.**—What trap for outside the wall of a house will satisfy the provisions of the Local Government Board? These wastes are to be discharged in the open air over a channel to a trapped gully. Information will oblige a—CONSTANT READER.

[11808.]—**Disconnecting House-Drains.**—Many methods for doing this are before the profession, but they are too elaborate and costly for general use. Is there a simple and inexpensive way of disconnecting the house-drains from sewer?—A BUILDER.

REPLIES.

[11794.]—**Parpoint Facing with Brick Lining.**—Parpoint wall facing with brick lining makes a very good and strong bond, if properly specified and carried out. This class of stone walling should be specified 3in. to 5in. deep, and 5in. in the bed, backed with either 4in. or 5in. brickwork, as required, walled with a cavity and a through stone every superficial yard, thus making the wall strong and well tied in.—ALBERT C. FREEMAN, 21, Green-street, Morecambe.

[11796.]—**Joists.**—If the ceiling joists are well seasoned, they will last for many years; the lime of the concrete is a preservative to some extent. No doubt it is better to ceil to laths fixed to joists than to plaster on the concrete. Ventilation or a current of air could be secured by boring holes through each of the ceiling joists in a few places, and to ventilate the space by a small opening in the outer wall. But there is a better way by using the expanded metal lathing for the plaster, and so avoid all wooden joists—the metal lathing is secured by hooks fixed in the concrete. The ceiling is thus suspended by small hooks below the concrete, thus allowing an air space and making a capital fire and sound proof ceiling. Send to the Expanded Metal Company, Ltd., Upper Thames-street, E.C., for particulars.—G. H. G.

[11797.]—**Contracts.**—I am very doubtful if any claim can be made under the circumstances related by

"Surveyor," as the contract was accepted and carried out, and the contractor can plead that his tender was accepted as a whole unconditionally. If the items were liable to correction, there may have been some ground for making the claim. Has the error been pointed out? As to liability for inaccurate quantities, a builder can obtain relief in equity if he finds a mistake in the bill of quantities, if he can show that the architect knew of it; and that being so, it is fair that any mistake the contractor on his side makes should be rectified. The case of "Neill v. Midland Railway" may help "Surveyor."—H. T.

[11797.]—**Contracts.**—"Surveyor" has opened an important question. Supposing the contractor had extended the 50s. as 50d., which of the two sums would "Surveyor" have considered he would have been entitled to place to the credit of his client? I have always considered a provisional sum in a bill of quantities to be a "fixed" one, entirely under the control of the architect (or surveyor), no matter how it has been treated by the contractor. If he ignores it (and probably obtains a contract by so doing), is the client to have the cost of his building increased if the provisional work be executed, or suffer by it not being done, through a contractor's negligence or wilfulness? If a provisional sum be magnified, it militates against the tender being the lowest; if it became a rule to deal with the "extended" sum (if it differs from the provisional amount), difficulties must arise. Having stipulated that a contractor shall provide a certain sum of money in his tender for something (seen or unforeseen) to be done, nothing more, nor less, should be considered when squaring-up the contract; whether he increases, reduces, or omits it is entirely his affair. In the quantities for the erection of a large public institution in a suburb of London, the provisional sum of £2,000 was inserted for carving. The contractor omitted to "extend" it; nevertheless the carving was executed, and no extra was allowed.—THOMAS S. JEROME, F.S.I.

CHIPS.

Colonel C. H. Luard, R.E., an inspector of the Local Government Board, held an inquiry in the council chamber, Cowpen, Blyth, on Friday last, into an application by the Cowpen Urban District Council to borrow £4,700 for works of private street improvement.

Ald. Hind, J.P., of Stockton, has just been elected and installed Master of the Worshipful Company of Plumbers. When Mayor of Stockton, in 1884, Ald. Hind was invited to become a member of the Company, and thereafter made a Liveryman and Freeman of the City.

At the Parochial Hall, St. George, Bristol, on Friday, Mr. C. March held an inquiry respecting the application made by the St. George Urban Council for loans of £6,898, £5,041, and £520, to be used for works and street improvements.

The Victoria Hall, Ancoats, erected by the Manchester and Salford Mission at a cost of about £9,000, was opened on Thursday in last week.

Considerable progress is being made with the demolition of slum property in Southampton, embracing the square between Blue Anchor-lane and Simnel-street. The work is being carried out under the supervision of the borough engineer, Mr. W. B. G. Bennett. Very little brickwork remains to be seen above the hoarding, and Blue Anchor-lane is closed to the public, together with King John's Palace.

At Shrewsbury last week, a block of board schools in St. Michael's-street were formally opened. The schools have been erected from the plans of Mr. A. E. Lloyd Oswell, architect, of Shrewsbury, and the contract was taken by Mr. T. Pace, also of Shrewsbury. The ground floor—the girls' school—consists of a general room, from which open out two classrooms (each capable of accommodating 60 children), cloakroom, and lavatories. On the mezzanine floor are the schoolmaster's rooms. The boys' school, which is situated on the top story, is a counterpart of the girls'.

Colonel A. J. Hepper, R.E., Inspector of the Local Government Board, held an inquiry at Wombwell, on Friday, in reference to an application to borrow £4,000 for the purposes of street improvement. There was no opposition to the application.

Trinity College Parish Church, Edinburgh, which has been in the hands of the painters and electricians, was reopened on Sunday, after renovation and decoration of the ceiling, walls, and iron columns. These decorations contrast well with the grey stone walls of the apse, which is constructed with the material that formed part of the original church built in 1462. Electric light installation has been introduced. The work was carried out by Messrs. J. and T. Harvey, painters, Forth-street, and Messrs. John White and Co., plumbers, South St. Andrew-street, Edinburgh.

Dr. Thomas held an inquest on Friday at St. Giles's Coroner's Court on the body of Thomas Henry Yeomans, aged 56, master builder, lately residing at 24, Marchmont-street, Bloomsbury, who on the previous Tuesday night was found dead, suspended by the neck from a beam in the store-room at his workshop in Drury-lane. After hearing the evidence of the son and brother of deceased, the jury returned a verdict of "Suicide while of unsound mind."

LEGAL INTELLIGENCE.

CASES UNDER THE BUILDING ACT.—SECTIONS 56 (3), 59 (1), PART VII. FIRST SCHEDULE AND BY-LAWS.—WOODEN INCLOSURES, PARTY WALLS, &c.—(A. Payne district surveyor of East Hackney (South) and North Bow v. William Slater. North London Police Court, before Mr. Frederick Mead.)—Mr. W. Slater appeared in person. The district surveyor said defendant had made a washhouse addition at back of 21, Lauriston-road, Hackney, converting the wall of adjoining house into a party-wall, without carrying out the rules as to party-walls with regard to it. He had erected an inclosure at the back of yard, of wood, with door and two windows, instead of a brick wall; he had also erected a copper and irregular chimney; he then allowed some time to elapse, and converted the whole into a building by putting a roof on. Defendant had carried out an addition at the same premises before in 1893, and stated that the things complained of had been done a long time before, and tried to mix up the case with the work done in 1893. The magistrate took sometime to consider his decision and gave judgment on Oct. 1, 1897. He stated that he had come to the conclusion that the work done by the defendant came within the Act, and must be done according to the rules. He inflicted a nominal fine of 10s. and 12s. costs, and intimated that if the work was not amended to the satisfaction of the district surveyor, the defendant would be liable to further penalties.

There was but little improvement in business at the Auction Mart last week, the absence of saleable properties being very marked. The aggregate amount of sales effected was £35,499. There was, however, a notable increase of successful transactions in the provinces, the demand for land continuing to show a firm upward tendency.

Although the restoration of the priory church of St. Bartholomew the Great is practically completed, further portions of the original building are still being found. During the last fortnight some 20ft. of the exterior wall of the north side of the Lady chapel have been uncovered whilst removing the earth from the site of Lady Saye and Sele's almshouses, which, until recently, abutted on to this side of the church. This wall will now be left permanently exposed.

The memorial stone of intermediate schools at Newtown, Mont., was laid on Thursday in last week. The building will be of brick with slated roofs, and will accommodate 70 boys and 65 girls. There will be an assembly hall seated for 150, six classrooms, laboratory, workshop, cooking and laundry rooms. The total cost will be £3,700 including site. Mr. W. H. Thomas, of Oswestry, is the contractor.

At the instance of the Strand Board of Works, the owner of five houses in White Horse-yard was summoned to Bow-street Police-court on Friday to show cause why they should not be closed. When the case was called there was no response, and it was stated that the landlord had not been near the houses for four or five months, even to collect the rents. It was also said that the dwellings, in which forty-three people were housed, were in a very dilapidated state; some of the staircases were dangerous; the water had been cut off, and the sanitary arrangements were defective. Sir James Vaughan made a closing order, but suspended it to enable the tenants to obtain other lodgings.

The ceremony of laying the corner-stone of a new chapel in connection with the Convent of the Little Sisters of the Poor, Gilmore-place, Edinburgh, was performed on Friday by Archbishop Macdonald. The building, which has already been commenced, is being erected by Messrs. Wm. Beattie and Sons from plans by Mr. James M. Monro, Glasgow. It is in the Romanesque style, and is intended to accommodate about 250 persons. Besides the chapel proper, there will be behind the sanctuary a number of sacristies for the use of the Sisterhood. The cost will be about £3,000.

A meeting of the General Purposes Committee of the Blackpool Town Council was held on Wednesday week, when the question of providing a tower for the new town hall was discussed. The design of Mr. R. B. Edmondson was submitted, and a tender handed in for the work, the amount for which was in advance of the last by £2,000. In answer to a question the town clerk stated that the cost of the new town hall, including the site, but not the tower, had been £40,172 so far. After several objections had been made to the heavy expenditure, a resolution was moved recommending the council to accept the tender.

At Tuesday's meeting of the London County Council it was agreed, on the motion of Dr. Longstaff and Mr. Benn, to instruct "the Parliamentary Committee to take steps to insert a clause in one of the Council's Bills empowering the Council to purchase or contribute towards the cost of purchasing or otherwise incur expenditure in connection with the preservation of buildings and places of historic or architectural interest."

WATER SUPPLY AND SANITARY MATTERS.

CARDIFF WATER SUPPLY.—In continued development of the new water supply for Cardiff, from the Breconshire Beacons, another reservoir, No. 1, was opened on Thursday in last week at the foot of the Beacons, about 10 miles beyond Merthyr and 34 from Cardiff. The embankment is 1,200ft. long across the Taff Vawr Valley, and incloses a storage which will amount, it is estimated, to 335,000,000 gallons, and afford an additional supply to Cardiff of 3½ millions of gallons daily. The cost of this reservoir approximates to £200,000. The work has occupied in construction four years and a half. The construction of other reservoirs in the Beacons district is regarded as a question of a few years only.

MIDDLETON, LANCs.—By the completion of the Middleton sewage scheme, which was celebrated on Friday by the opening of the new outfall works, the condition of the Irk, whose murky waters as they flow into the Irwell have long been a reproach to Manchester, will be considerably improved. Instead of pouring raw sewage into the river, the Middleton Corporation will now be able to discharge a clear and apparently inoffensive effluent. The whole cost of the sewerage and sewage disposal works, which have now occupied the attention of the health committee for a year or two, will be at least £50,000. The scheme provides for a present population of between 24,000 and 25,000, and for any considerable increase which there may be for many years to come. The sewage works opened are at Land's End, near Rhodes, and there is ample ground for their expansion as the needs of the town—of late growing somewhat rapidly—may demand. The committee decided to adopt the International system of sewage treatment, now very well known in this country. The cost of the works will amount in all to about £13,500. Mr. H. L. Hinnell is the engineer. The sewage passes through clarifiers to the filter-beds, where it is united with polarite. The process of pressing the sludge from the sewage tanks into cakes for manure was shown at the inaugural ceremony.

CHIPS.

At Friday's meeting of the Stirlingshire County Council, Mr. G. T. Gough was appointed sanitary inspector for the western division of the county.

Lady Kennaway unveiled, on Wednesday week, a lychgate which has been placed at the entrance to Alington churchyard, near Ottery St. Mary. The church was built in 1849, and the contractor for the gate, which is of oak on masonry foundations, was Mr. William Eastern.

The steam tramways at Stockton, Thornaby, and Norton were discontinued on Monday, this course being rendered necessary by the forward condition of the work of laying the lines for the new electric system. As far as Blair's works in Norton-road have been reached from Norton, and work has been commenced from the Brewery Bank, Thornaby, down the Middlesbrough-road. On Monday operations will be commenced in the Stockton High-street, and the Norton and Thornaby gangs will work towards this centre. Some hundreds of men are employed, and the progress made has been very rapid. The system is expected to be in running order by May.

At Hope Park U.P. church, Edinburgh, on Friday, a memorial tablet to the late pastor, the Rev. Thos. McEwan, was unveiled. Let into the vestibule wall opposite the main entrance to the church, the medallion, which is in bronze, and represents Mr. McEwan in the act of preaching, rests on a dark marble slab. It is the work of Mr. Pittendrigh Macgillivray, sculptor, of Edinburgh.

The Clergy Daughters' Schools, Casterton, Kirkby Lonsdale, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The extension scheme of the Church of Scotland in Govan parish was advanced another step on Saturday, when the foundation-stone of St. Margaret's Church, Polmadie, was laid. The new edifice, which is to be Early Norman in style, will be seated for 800 persons, while 300 more will be accommodated in halls adjoining. The interior will be finished in undressed stone, the roof will be of open timber, and the congregation will be seated on chairs. The total cost is estimated at £4,000. Two other churches are also in course of erection in the parish of Govan as part of the same movement. One, that of St. Bride in Partick, will be opened this month, and the other, that of St. Kenneth in Linthouse, has just been commenced.

The forthcoming archaeological report of the Egypt Exploration Fund for 1896-7 will contain Mr. B. P. Grenfell's report of his excavations at Behnesa (Oxyrhynchus), and also a collation by Mr. A. S. Hunt of four chapters of Thucydides, from a papyrus of the first century.

Our Office Table.

A LECTURE upon Art, considered on its practical side, was given before the Art Society at Southampton, on Thursday evening in last week, by Mr. G. D. Leslie, R.A. The author prefaced his lecture by remarking that he had been accustomed to the smell of paint from his infancy, and had had the benefit of visiting the workshops of brilliant artists during the past fifty years. Not only had he talked to and asked questions of them, but had in many instances seen them actually at work, and, furthermore, in his own work, having been extremely fond of trying all sorts of technical dodges and experiments, it occurred to him that possibly it might be of interest to them, if he were to give them a few of the results of his experience of some of the various methods, mediums, and materials by which artists expressed their ideas. This he proceeded to do, and referring in passing to pen-and-ink work, he advised all who had children who were artistically inclined, to let them draw in pen and ink, and never mind the mess they made with the ink. It was splendid material for them to learn in, and there was always a living for the person who could draw well in line. After a brief reference to water-colour painting, the artist remarked that fresco painting was entirely unsuited to our climate. Mural decoration in England seemed to be a failure on account of the smoke and gas, though in churches and other clean places a mixture of ordinary oil-colours with turpentine and wax was very effective and durable. He painted a small revedos in this way thirty-five years ago, and it had lasted admirably. In the course of some instructive hints with reference to painting in oils, Mr. Leslie said that if there were fewer exhibitions better work would be accomplished. If painters could take two or three years over a picture they would do better.

THE Superior Jury at the Brussels Exhibition have confirmed the awards made to the following British artists:—Médaille d'Honneur.—L. Alma-Tadema, R.A. First-class Medals (painting).—Frank Dicksee, R.A., E. J. Gregory, A.R.A., Seymour Lucas, A.R.A., H. Herkomer, R.A., Sir J. D. Linton, P.R.I., J. W. Waterhouse, R.A., J. C. Hook, R.A., J. S. Sargent, R.A.; E. Onslow Ford, R.A. (sculpture). Second-class Medals (painting).—W. Q. Orchardson, R.A., S. J. Solomon, A.R.A., J. Aumonier, R.I., G. Clausen, A.R.A., Charles Green, R.I., D. Murray, A.R.A., Mrs. Allingham, R.W.S., R. Macaulay Stevenson, J. Lavery, J. W. North, A.R.A., W. W. Ouless, R.A.; J. L. Pearson, R.A. (architecture); G. Frampton, A.R.A. (sculpture), A. Drury (sculpture); D. Y. Cameron (engraving). The exhibition authorities have purchased the picture "Apple-blossom and Tulips" (No. 118), by Alfred Parsons, A.R.A., for the Grand Lottery.

THE utter lack of capability on the part of some of our clergy to grasp the merits of things architectural is aptly illustrated by the following recent incident:—A case was tried in a Consistory Court in the West of England last week, the rector being desirous of erecting oak stalls in his chancel at his own expense, and the principal farmer of the parish opposing on the score of stalls being Roman innovations. The parson won the day, and the farmer was mulcted in costs. When asked by a correspondent who the architect was under whom the proposed new work would be carried out, the reverend gentleman replied there was none, and explained that he had gone to a ready-made provider of such things. To use his own words he said:—"The work was so small a matter it did not seem to me worth while to employ an architect. . . I simply went to him" (i.e., the universal provider), "and bought half a dozen stalls just as I might have bought half a dozen surplices." Comment is needless.

THE distribution of prizes to the students of the architecture and building construction and wood-carving classes was held on Thursday evening in last week at King's College. The Rev. Dr. Robertson, principal of the college, occupied the chair, and was supported by, amongst others, Sir Henry Harben, and the master, clerk, and warden of the Carpenters' Company. Professor Banister Fletcher reported that the competition for the two free scholarships, given by the Carpenters' Company, took place at the college on September 27. There were twelve candidates, of whom ten sat for the examination, the successful candidates being Mr. A. C. Remnant (126 marks)

and Mr. C. J. T. Dadd (123 marks). In conclusion he announced that since the opening of last session the whole of the original diagrams and drawings prepared by the late Sir Gilbert Scott, R.A., and his pupils, numbering some 400 drawings, had been presented by his son, Mr. John Oldrid Scott, F.S.A., to the architectural school of the college. Sir Henry Harben presented the prizes to the successful students, and afterwards delivered a short address to the students present. The Rev. Dr. Robertson, in proposing a vote of thanks to Sir Henry Harben, observed that a great deal of the success which the classes had achieved was due to the support received from the Carpenters' Company. Mr. Joseph Henry Gibbins, Master of the Carpenters' Company, seconded the vote, which was carried unanimously. A *conversazione* was held afterwards, various exhibits in connection with the architectural classes being thrown open to the guests.

PUBLIC interest will be revived in the discovery a few years since of the remains of the famous pleasure triremes of the Emperor Tiberius, at the bottom of lake Nemi, about 17 miles south-east of Rome, from the fact that last week the Court at Rome ordered the castle and lake of Nemi to be offered by public auction for debt. The present owner of the Nemi estate is Don Filippo Orsini, Prince Assistant at the Pontifical Throne, the highest lay position at the Papal Court. The remains found include several massive metal mooring rings, fixed in the mouths of well-modelled bronze heads of Meduse, lions, and wolves, all in an excellent state of preservation. The stakes to which the Tiberian vessels were moored to the quay are also in a good state of preservation, and it is conjectured that the remains, possibly some portions of the famous triremes themselves, are still submerged in the lake.

THE fourth annual convention of the National Association of Master House Painters of England and Wales was opened in the Albert Hall at Sheffield, on Tuesday, by the Duke of Norfolk, who was followed by an address from the President, Councillor J. Smith, of Sheffield. The attendance of delegates and guests has been about 300. A portion of the Albert Hall has been set apart for an exhibition of wall decoration, brushes, paints, varnishes, &c., used in the trade, was thrown open to the public since Friday last. On Tuesday afternoon, the reports of the various committees were taken, and in the evening Mr. J. T. Cooke, headmaster at the Sheffield School of Art, read an interesting paper on "Art and Technical Education and Art Classes," which was followed by a discussion. The two papers read on Wednesday morning were one discussing "The Desirability or Otherwise of Painters' Standards," by Mr. Alex. G. White, Liverpool, and one by Mr. Goodier, namely, "A Review of the Modern Practice of asking for Tenders, with some Suggestions for the Remedying of the Abuses Therein." Mr. Hugh Stannus, F.R.I.B.A., gave an address in the afternoon on "The Development of Counter-Change in Colour," and "Some Notes on the Artistic Side of our Craft" were given by Mr. Thomas Bonnar, F.S.A. On Wednesday evening the President's "At Home" took place, and yesterday (Thursday) the annual excursion to Chatsworth and the annual dinner furnished a pleasant wind-up to the proceedings. To-day (Friday) several of the famous works in the city will be visited.

A MEETING of the Newquay Urban District Council was held last week to consider the plans submitted by Mr. Silvanus Trevail, F.R.I.B.A., of Truro, for an hotel to be built at Headland, concerning which site, it will be remembered, there is an animated dispute, which recently culminated in riotous proceedings as to an alleged right of way. The surveyor reported that the plans were in perfect accordance with the local by-laws, and some of the members still proposing to delay coming to a decision, the clerk pointed out that the members must approve or disapprove of the plans, and assign a reason within a month, in accordance with section 158 of the Public Health Act of 1894. He further reminded the members that no reference to a right of way ought to influence them in passing or rejecting plans; but they might, in a separate communication, draw attention to the alleged public rights over the land. It was eventually unanimously resolved to disapprove of the plans on the ground that the drainage outlet was not thought suitable; and further, to disapprove of them on the ground that it would obstruct public rights of way, and a committee of the board and of outside townsmen

was appointed to contest the latter point, if necessary.

The annual distribution of prizes and certificates awarded to the students attending the plumbing classes at the Regent-street Polytechnic during the season 1896-7, took place on Monday night. The teacher's report was of a highly satisfactory character. One hundred and forty students were on the class roll, and of 70 taking part in the examinations, 15 had passed in honours (one obtaining a medal and money prize), 15 in the ordinary grade, and 18 in the preliminary section. Eight students, moreover, had gained scholarships presented by the Technical Education Board of the London County Council. Sir Philip Magnus occupied the chair, and while distributing the prizes, observed that there was no class of tradesmen in whom the public seemed to take so deep a concern, and so intelligent an interest, as the plumbers. This was probably due, to some extent, to the fact that the public recognised its dependence for comfort and sanitary conditions on the intelligence, skill, and morality of those engaged in the plumbing trade. They heard a great deal of foreign competition and of foreign workmen beating down the wages of our own artisans, but he had never seen a foreign plumber in this country. On the contrary, we exported our plumbers to all parts of the world, and found them busily occupied in nearly every important city on the Continent. If they wanted to know where to reside in a sanitary hotel at Nice or Naples, Cairo or Constantinople, they should not consult Baedeker, but go to some of the large English plumbing firms and find out where they had been doing their work abroad. Young plumbers must clearly understand that they were expected to possess other qualifications than knowledge and skill in their work. They must have thorough trustworthiness, love of truth, and a determination that they would never cover up any work that was not good. The plumber must work with his hand, brain, and soul; he must be intelligent, skilful, and truthful. This was a high ideal to set before them; but unless they accepted it, they would never succeed in satisfying their own consciences, or in doing the good work that was expected of them.

The British Consul at Gothenburg, in his annual report on the trade of his district, says that along the coast from the Norwegian frontier as far as the Gullmar Fjord there is an almost uninterrupted stretch of splendid granite, with an average breadth of about three miles, while there are good and safe harbours and anchorages where vessels may load under almost any circumstances, and, as a rule, without hindrance from ice in winter. Southward near Warberg and Holmstad, and farther on in the neighbourhood of Carlshamm and Carlsrona, there are also granite fields of considerable extent. Quarrying has been carried on for many years, but not on such a large scale as of late. Germany and Denmark used to be the chief consumers; but since the industry has grown into one of importance, other markets have been found, and orders have been received from across the Atlantic. Polished granite is not much exported or used within the country; the granite is supplied to buyers in a semi-rough state, and they finish it to suit their own requirements. The granite of the different districts is suitable for all purposes—for architectural and ornamental work, as well as for paving streets and for making docks and quays. The colours are of great variety and beauty, and the Consul thinks there are excellent opportunities for British importers obtaining raw material at a moderate price, since vessels carrying coal, salt, iron, or coke out are always willing to accept a low freight home.

The jubilee of the ministry as vicar at St. Peter's Church, Plymouth, of the Rev. G. R. Prynn, M.A., was to have been celebrated on Tuesday by the dedication of a colossal statue of our Lord, which was to stand in his church within a carved niche, just erected for that purpose, in the limestone wall facing the main entrance by the south-west porch. The new work has been designed, in keeping with its immediate surroundings, by Mr. Geo. H. Fellowes-Prynn, F.R.I.B.A., of Queen Anne's Gate, Westminster, the son of the vicar, and architect of the church, and during the past week members of the staff of Messrs. Harry Hems and Sons, of Longbrook-street, Exeter, in whose studios the sculpture and its accessories were carried out, have been engaged in its erection. On Saturday, however, on opening, in the church,

the large case containing the statue, it was found that in transit over the railway it had come to grief, being broken in twain, the damage being quite past remedy. A new statue—a replica—will have to be made, representing a labour and serious delay of several months. The damaged statue represented a figure of our Lord some 8ft. high, carved, like the niche, in Caen stone. In the meanwhile, the new niche must remain vacant until Messrs. Hems and Sons can carve a new statue.

THE ARCHITECTURAL ASSOCIATION.

CLASSES COMMENCE OCTOBER 11th .. 6.30 p.m.
STUDIO OPENS .. 12th .. 6.30 p.m.
Pamphlet containing full particulars and nomination forms for membership may be obtained upon application to the Hon. Secs., at 56, Gt. Marlborough-street, W.

E. HOWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

CHIPS.

It is estimated that there are nearly 300 houses in course of erection or recently completed in Peterborough.

The Horseferry Wesleyan Chapel at Pontefract was reopened last week after having been decorated by Messrs. Henry Butler and Sons, of Pontefract, from specifications and designs by Mr. Thomas Bottomley, of Crosshills, near Keighley.

A strike of some 7,000 builders' workmen is in progress in New York, Brooklyn, and Jersey City. The strike will be a sympathetic one. Its purpose is to help the slate and metal roofers and the cornice and skylight makers to gain their demands for higher wages.

St. John's parish church, Edinburgh, was reopened on Sunday after internal decoration in colour and the introduction of the electric light, effected at a cost of £600.

The new Royal County Theatre, Kingston-on-Thames, was reopened on Monday night. The house, which is of small proportions, is built for the Kingston Theatre Co., Ltd., and seats 1,250 persons, of which the pit and gallery accommodate 500 each. The theatre is lighted by electricity, and hydraulic machinery sufficient to cope with any outbreak of fire has been provided.

The Right Rev. Dr. Temple, Archbishop of Canterbury, paid his first visit to Maidstone on Friday for the purpose of conducting the formal reopening of the church of Holy Trinity, after the completion of renovation and decoration at a cost of over £500, and the dedication of the new chancel screen which has been erected at St. Paul's Church. The interior of the latter church has, during the past two years, undergone many improvements. The seating is entirely new, as well as the pulpit and organ stand and cover. The pulpit is a work of art, and on its panels are carved scenes illustrating Biblical passages. The organ cover and stand is also carved, and the chancel screen is said to have been designed by the late Archbishop Benson, and it has been, at all events, carried out strictly in accordance with his wishes.

The arbitration on the claim of Messrs. Watson and Wilson for extras in connection with their contract with the Manchester Corporation for a section of the Thirlmere aqueduct has been going on this week and all last week before Mr. Hayter. The inquiry, which has been of a protracted character, involving much expense, is expected to be concluded in another week.

The Hammersmith Vestry inaugurated on Friday a new scheme for electric lighting. Under the supervision of Mr. A. H. Preece, a generating station has been erected in Fulham Palace-road, from which electricity is distributed under the high-pressure alternating current system. Between sunset and midnight the streets are lighted by arc lamps, giving a light equal to 1,200c.p. After that hour glow lamps are used. Sixpence a unit is charged to private consumers for the first two hours, and fourpence a unit for succeeding hours, a unit of electricity being equal to the light of a gas-burner consuming 120c.ft. of gas. The alternative scale is that of the Board of Trade—2½d. per unit, with a fixed charge of 1s. 3d. per quarter for every 8c.p. lamp. The cost of the installation has been £40,000, and between 8,000 and 9,000 lamps must be in use before a profit can be made.

Mr. William Blythe, C.E., Edinburgh, has been consulted by the Dee District Fishery Board with regard to the proposals of Aberdeen Town Council as to the sewage outfalls in the Dee. On Saturday he made an inspection of the ground for the purpose of submitting a report on the subject.

The master builders in Yorkshire have formed themselves into a society under the title of the Federation of Building Trade Employers. The association, the object of which is the furtherance of the employers' interests, already numbers nearly 700 members.

On Thursday in last week a man named Grant, employed by Messrs. Perkins Brothers, contractors for the redecorating of the Cardiff Conservative Club, was discovered dead, and fearfully mutilated, at the bottom of a lift employed for the conveyance of food. A verdict of "Accidental death" was returned by the coroner's jury.

Sir Augustus Webster, who is having a mansion built for himself at an estimated outlay of £20,000 at Rose-hill, a fine position near the old Roman road between Mottisfont and Broughton, Hants, inspected the works on Tuesday. Messrs. Jenkins and Sons, of Southampton, are the builders.

The movement for the erection of a clock tower on the Eastgate at Chester, in commemoration of the Diamond Jubilee, was again the subject of discussion on Friday, at a meeting of subscribers, presided over by the mayor. It was stated that the money in hand was £660, and it was decided to ask Messrs. Douglas and Fordham, architects, to prepare a design of light iron framework, on the centre of the Eastgate, to receive the clock which Colonel Evans Lloyd offers to present to the city.

The opening of the new County Council offices now in course of erection in Wakefield for the West Riding C.C. at a cost of £100,000 has been postponed from December 1st until the 23rd February next, on account of the backward state of the buildings.

On Saturday the Bishop of Lichfield dedicated a reredos which has been erected in St. Chad's, Lichfield, to commemorate the forty years' pastorate of the late rector, the Rev. Prebendary John Graham, M.A. The reredos is of carved oak, with a representation of Christ as the Good Shepherd in the centre panel, and has been erected, from designs of Mr. J. Oldrid Scott, by Mr. R. Bridgeman. The floor within the communion rails has been relaid with black-and-white marble, and a brass tablet has been placed on the south wall of the chancel.

A Local Government Board inquiry was held at the town-hall, Westbury, Wilts, on Friday, before Col. J. T. Marsh, R.E., in respect to the application of the rural district council of the Westbury and Whorwellsdown Union for granting a loan of £8,000 for carrying out a water supply for the parishes of Westbury and Dilton Marsh. Mr. J. Callaway, clerk to the district council, explained that the population of the proposed area affected was 4,559, and the ratable value £18,156. The well and reservoir were in the parish, and a provisional agreement had been made for the purchase of the land at £500. Mr. W. H. Stanley, surveyor, presented the plans and estimates. No objection was raised to the scheme.

The West United Presbyterian Church at Alloa, N.B., which has just been repainted and decorated, was reopened on Sunday. The interior has been painted from designs by Mr. Bonnar, Edinburgh, while the lighting and ventilation have been improved.

At Hollywood Petty Sessions, Belfast, on Saturday, Philip Dugan, builder and contractor, and his wife, were committed for trial charged with the manslaughter of their son, aged 10½ years, at Bloomfield on Aug. 16.

"A History of Renaissance Architecture in England, 1500-1800," by Mr. Reginald Blomfield, M.A., of Exeter College, Oxford, will be published shortly by Messrs. George Bell and Sons. It will be in two volumes, and will be illustrated with about 150 illustrations from pen drawings by the author, and 90 plates in colotype and half-tone from photographs, drawings, and prints.

St. Jude's Church, Hardwicke-street, Liverpool, was reopened on Sunday after internal decoration in colour, carried out by Messrs. G. H. Morton and Son, of Bold-street, in that city.

Sir George Newnes has intimated his intention to build on Clarke's Garden, Lynmouth, a town hall, municipal buildings, and a literary institute for the parish. The scheme will cost over £4,000. At the recent meeting of the Lynton Urban District Council Mr. B. Jones, the architect, explained that Sir George proposed to build, on a piece of land he had purchased in Lee Lane, some buildings, to include a public hall, which would accommodate between 400 and 500 people, a council room, with offices, magistrate's chambers, free library, which he would furnish with books, men's institute, and caretaker's rooms, subject to the council's approval. A hearty vote of thanks was passed to the donor. A committee was appointed to meet Mr. B. Jones, who has been requested by Sir George to prepare plans, &c., to consider the necessary arrangements for the buildings.

In order to avert a repetition of the scarcity of water experienced in Sandycroft during the recent drought, the Hawarden Waterworks Company are constructing a reservoir near the entrance to Moorlane, which will have a water capacity of 76,800c.ft., equal to 479,000 gallons. The bottom of the reservoir is about 90ft. above the level of Sandycroft. The work is being done under the supervision of Mr. Simmonds.

LIST OF COMPETITIONS OPEN.

Dorking—Workhouse Infirmary (65 beds, £4,000 limit)	(No first) £15, £5	Geo. Seales, Clerk, High-street Dorking	Oct. 13
Pickering & Kirbymoorside—Gravitation Water-Supply Scheme	No Premium	Robert Kitching, Clerk to Pickering R.D.C., Pickering	" 16
Colne—Technical School, Free Library, and Public Hall (£5,500 limit)	£50, £35	Alfred Varley, Town Clerk, Town Hall, Colne, Lancs.	" 20
Wolverhampton—Free Library (selected Architects)	£40 for Combined Scheme, £15 for Eastcote, and £25 for Northwood.	The Town Clerk, Wolverhampton	" 28
Eastcote and Northwood, near Ruislip—Sewerage Scheme	25 Guineas	C. Woodbridge, Clerk, R.D.C., 38, High-street, Uxbridge	" 30
Byfleet—Village Hall and Workmen's Club (£1,500 limit)	No premium offered; no Assessor named	F. C. Stoop, Hon. Sec., Albany House, Byfleet, Surrey	Nov. 13

Winchfield—Cottage Home	Guardians	F. S. Chandler, Clerk, Odiham, Hants	" 22
Kennetmouth—Distillery, Houses, and Cottages	St. Marylebone Board of Guardians	C. C. Doig, Architect, Elgin	" 22

BUILDINGS—continued.

Lowestoft—Batteries and Drill-Shell	Royal Navy Reserve	Director of Works, Admiralty, Northumberland-avenue, W.C.	Oct. 22
West Mersea—Schools for 365 Children	School Board	J. W. Start, F.S.I., Architect, Colchester	" 22
Windsor—New Passenger Station	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, W.	" 26
Hampstead—Enlargement and Alterations, Fire Brigade Station	London County Council	C. J. Stewart, Clerk, Spring-gardens, S.W.	" 26
Leeds—Public Baths, Meanwood-road	Baths Committee	Walter Hanstock, Architect, Branch-road, Batley	" 26
Manorhamilton—Repairs to Courthouse	Barry Railway Company	E. O'N. Clarke, County Surveyor, Carrick-on-Shannon	Nov. 1
Barry Dock—Offices		F. and W. Stockers, Surveyors, 90, Queen-street, Cheapside, E.C.	" 1
Barnes, S.W.—Six Shops and Houses, Rocks-lane		Bell, Williams, Son, & Co., Surveyors, 40, North John-st., Liverpool	" 2
Bromborough—Detached Villa	Herbert Croft	John Stalker, M.S.A., Architect, 57, Highgate, Kendal	
Kendal—Enamelling-House, Stramogate Bridge		F. J. Yates, Architect, 1, Newhall-street, Birmingham	
Bromsgrove Lickney—Residence	Sisters of Sacred Heart	T. Taylor Scott, F.R.I.B.A., Architect, Carlisle	
Carlisle—Warehouses, Scotch-street		J. J. Macdonnell, Architect, 27, Chichester-street, Belfast	
Portadown—Convent		J. Plant, Wilderness Works, near Wrexham	
Gwersyllt—Additions to National Schools	Captain Key	C. Foxwell, 14, Wainfein-road, Pontypool	
Pontypool—Two Houses, Wainfein-road		R. Curwen, Archt., Hamilton House, Bishops-gate-st. Without, E.C.	
Bournemouth—Wesleyan Church and Schools, Westbourne	Stanton Drew School Board	Digby Cayley, 7, Blake-street, York	
Water Fulford—Farm Buildings		Eugene Beaumont, Architect, 78, Fleet-street, E.C.	
Enfield—Terraces of Cottages	Lower Bebington U.D.C.	J. Ace Berson, M.S.A., Sunnyside, Coleford, near Bath	
Pensford—Schools	Godstone Board of Guardians	Pearce and Olin, Dorsetshire Bank Chambers, Bournemouth	
Swanage—Burlington Hotel		Joseph Young, Surveyor, 75, Stanley-terrace, New Ferry	
New Ferry—Mortuary	Leeds and Leicester Boot Co.	R. B. Pratt, Architect, County Bank House, Elgin	
Roths, N.B.—Town Hall	Imperial Tramways Co.	E. A. Head, Clerk, East Grinstead	
Bletchingley—Workhouse Enlargement		S. Evans, Architect, 36, Heron-road, Hayne Hill, S.E.	
Camberwell—Pair of Semi-detached Villas, Benhill-road	Roberts, Mart, and Co., Limited	Ernest R. Ridgway, M.S.A., Architect, Long Eaton	
Long Eaton—Alteration of a Shop	Holbeach Public Hall Company	W. Griffiths, Architect, Llanelly	
Llanelli—Additions and Alterations to Brynau New-road		Clifton Robinson, C.E., Bridge-row, Stockton-on-Tees	
Stockton-on-Tees—Buildings and Chimney, Bridge-road	Kirby Banks	Secretary, Revolving Observation Tower Syndicate, Gt. Yarmouth	
Revolving Observation Towers—Twelve	L. and N.W. Railway Company	John Fenwick and Sons, Limited, Hexham-on-Tyne	
Leeds—Extension of Mill Premises, East-street	Miss Lilly	Joseph Sawyer, F.R.I.B.A., 63, Chancery-lane, London, W.C.	
Hexham-on-Tyne—Square Chimney (75ft. high)	D. J. Lanigan	Eaton, Sons, and Cantrell, Architects, Stamford-st., Ashton-u-Lyne	
Holbeach—Public Hall	H. J. Goodey	Margrave and Peacock, Architects, Metal Exchange, Swansea	
Stalybridge—Conservative Club, Mottram-road	Shoreditch Vestry	J. M. Fawcett and Son, Architects, 26, Albion-street, Leeds	
Swansea—Additions, Waterloo Hotel, Oxford-street	A. B. Wilkinson	W. W. Fookes, Surveyor, Wrexham	
Hunslet—Extensions to Jericho-street Mission Chapel	Carr and Co.	C. W. Lambert, 39, Whingate, Armley	
Moreton—Footbridge	H. R. Kirk	H. Harper, Architect, Market-place, Nottingham	
Halton—Four Houses, Graveleythorpe	School Board	John Kassell, Architect, Kirby Lonsdale	
Skegness—Pair of Villas, Alghitha-road	T. Willans Nussey, M.P.	Amble and Bowman, Architects, 9, Park-place, Leeds	
Kirkby Lonsdale—Alterations and Additions, Royal Hotel		T. Peckett, 19, Wood-road, Hillsborough	
Roundhay—Pair Semi-Detached Houses, Lidgett Park Estate		G. F. Aveline, Estate Office, Central Station, Preston	
Hillsborough—Two Houses		R. B. Pratt, Architect, County Board House, Elgin	
Preston—Sixteen Houses		Amble and Bowman, Architects, 9, Park-place, Leeds	
Roths—Town Hall		R. G. Fogg, Invercadd Office, Braemar	
Roundhay—Detached House		W. Packer, Clerk, School Board Offices, Leeds	
Braemar—Stables and Office Houses at Invercauld Arms Hotel		Amble and Bowman, Architects, 9, Market-place, Leeds	
Leeds—Caretaker's House, Whingate-road School		Thomas Pentland, Architect, 35, High-street, Belfast	
Armley—Two Houses in Whingate		R. Curwen, A.R.I.B.A., 149, Bishops-gate-street Without, E.C.	
Whitehead, Belfast—Villa Residence		W. F. Taylor, Architect, Aylesbury	
London—Additions to House at 5, Whitehall Gardens		Isitt, Adkin, and Hill, Architects, Prudential-buildings, Bradford	
Aylesbury—Three Shops and Houses, Cambridge-street		H. Mansfield Robinson, Clerk, Town Hall, Old-street, E.C.	
Ilkley—Pair of Semi-Detached Houses		T. Peckett, 19, Wood-road, Hillsborough, Sheffield	
London, E.C.—Three Blocks of Artisans' Dwellings in Moira-		Eaton, Sons, and Cantrell, Architects, Stamford-st., Ashton-u-Lyne	
place and Plumbers'-place, City-road		George Tyack, Tyne View, Haydon Bridge	
Hillsborough—Two Houses		Johnstone Bros., Architects, 39, Lower-street, Carlisle	
Ashton-under-Lyne—Cottages		H. E. and A. Bown, Architects, Harrogate	
Haydon Bridge—Cottage Villas		Albert E. Kirk, A.R.I.B.A., 13, Bond-street, Leeds	
Carlisle—Offices at Caldewgate		John M. Dossor, A.R.I.B.A., Architect, 2, Manor-street, Hull	
Harrogate—Detached Villa, Ripon-road		W. Dust, 40, Bank-street, Sheffield	
Headingley—Stables, Shops, and House, Cottage-road		H. E. and A. Bown, Architects, Harrogate	
Bridlington Quay—Villa		W. H. Walley, Architect, Queen-street, Burslem	
Aston-cum-Aughton—Additions, Swallow-Nest Schools		S. Wilkinson, Architect, Sowerby Bridge	
Harrogate—Caban's Shelter		H. E. and A. Bown, Architects, Harrogate	
Stowe—Small Farmhouse, Lea Heath		Wm. McCoy, Wellington-street, Barnsley	
Sowerby Bridge—House in Clifton-street			
Rushwood—Lodge			
Barnsley—Eleven Houses			

ENGINEERING.

Andover—Sinking Stormwater Well	North Riding County Council	Alfred Purkess, Borough Surveyor, Town Hall, Andover	Oct. 9
Sike, Thirsk—Rebuilding of Highway Bridge	Gas and Water Committee	Walker Stead, M.I.C.E., Northallerton	" 9
Ramsgate—Three-Lift Gasholder	Urban District Council	W. A. McIntosh Valon, Engineer, Hardes-street, Ramsgate	" 11
Southborough—Laying Gas Main (10in., 2,400 yards run)	Rural District Council	P. Hammer, Clerk, Southborough	" 11
Hemel Hempstead—C.I. Pipes (four miles)	Board of Guardians	L. Smeathman, Clerk, Hemel Hempstead	" 11
Bradford—Steel Lattice Footbridges, Workhouse	Glyncoerw U.D.C.	G. Wall, Clerk, Haxstead-road, Bradford	" 12
Cymmer—Water Mains (5,400 yards)	Axbridge Rural Sanitary Authority	Cuthbertson and Powell, Clerks, 58, Water-street, Neath	" 13
Compton Bishop—Water Supply Works	Official Corporation	Wm. Reed, Clerk, Axbridge	" 14
Inverness—Heating Hospital Wing of Asylum	Gas Company	Ross and Macbeth, Architects, Queen's-gate Chambers, Inverness	" 15
Nice—Steel Bridge over the Pailon		Le Mairie, Nice	" 18
Southend-on-Sea—Pumping Machinery		William Gregson, Town Clerk, Alexandra-st., Southend-on-Sea	" 18
Baldock—Mill Machinery		John Randall, Stotfold Mills, Baldock, Herts	" 18
Budeigh Salerton—Gasholder and Tank		W. A. Paddfield, Gas Offices, Exeter	" 19
Glasgow—Electrical Equipment, Springborn to Mitchell-street			
Leeds—Widening Works, Burley-street	Corporation	J. D. Marwick, Town Clerk, City Chambers, Glasgow	" 20
Llyn Fawr—Reservoir	Corporation	Town Clerk, Town Hall, Leeds	" 20
Pontrhydydd—Railway (two miles)	Rhonda Urban District Council	Walter H. Morgan, Clerk, Treforest, Pontypridd, Glam.	" 20
Renwick—Oblique Bridge Across the Raven, Sickergill	Rhonda and Swansea Bay Rly. Co.	H. S. Ludlow, Secretary, S. Fisher-street, Swansea	" 23
Knighdon, Radnor—Nine Miles of Aqueduct from Knighdon to	Penrith Rural District Council	C. N. Arnison, Clerk, Penrith	" 23
Downton (Two Lines of Cast-Iron Mains, 42in. Diameter)			
Tull—Electrical Equipment of Tramways (9 miles Double Track)	Corporation of Birmingham	E. Orford Smith, Town Clerk, Council House, Birmingham	" 23
Leeds—Sinking Well in York-street	Corporation	A. E. White, City Engineer, Town Hall, Hull	Nov. 5
Galway—Steel Joists, Iron Roof, and Balcony for Convent	Yorkshire Pure Ice Company	W. S. Braithwaite, Architect, 6, South Parade, Leeds	"
		James Costello, Sea-road, Galway	"

FENCING AND WALLS.

Hemsworth—Works of Wood Fencing	Rural Sanitary Authority	Joshua Scholesfield, Clerk, Hemsworth	Oct. 12
Redruth—Fencing the Public Park		Horace W. Collins, Architect, Penryn-street, Redruth	" 15
Nottingham—Walling-in Garden, Mansfield-road		W. H. Radford, Architect, Pelham Chambers, Nottingham	"
Fairfield, North Derbyshire—Retaining Wall to Village Green	Urban District Council	Garlick and Flint, Architects, Buxton	"
Port William—Hill Fencing (1,000 yards)		N. B. Mackenzie, British Linen Bank, Fort William	"
Ramsgate—Iron Fence (1,650ft. run)	Gas Committee	W. A. McIntosh Valon, Engineer, Ramsgate	"

FURNITURE AND FITTINGS.

Guildford—Royal Surrey County Hospital	Assistant Secretary to Hospital, Guildford		Oct. 9
Brentwood—142 Beds and Fittings, County Asylum	Committee of Visitors, County Asylum, Brentwood		" 16
Crewe—Technical Institute	Town Council	J. A. Jenkins, Secretary, Municipal Offices, Crewe	"

PAINTING.

Cardiff—52, Charles-street	Guardians	Arthur J. Harris, Clerk, Queen's Chambers, Cardiff	Oct. 9
Bideford—Cemetery Lodge and Shelter	Urban District Council	H. Chown, Borough Surveyor, Bideford	" 9
Brynmawr—Rehaboth Chapel		W. Jones, 11, Clydach-street, Brynmawr	" 9
Cockermouth—Offices	Urban District Council	John Pearson, Clerk, Cockermouth	" 9
Leicester—Fountain, &c., in Town Hall-square	Estate Committee	E. Geo. Mawbey, C.E., Borough Surveyor, Town Hall, Leicester	" 9
Heywood—Municipal Buildings		James Diggle, C.E., Engineer, Municipal Buildings, Heywood	" 11
Wigan—Artisans' Dwellings, Vauxhall-road and Pottery Areas	Corporation	J. J. Charnock, Town Clerk, Municipal Buildings, Wigan	" 19
Selby—Thirty Houses (outside only)		T. C. Fawcett, Ousegate Maltkin, Selby	"
Wrexham—Twelve Houses in Regent-street		J. Squire, 10, Temple-row, Wrexham	"
Dewsbury—Twelve Houses in Regent-street, and Four at Fall-lane		J. C. Thorne, 1, Ashworth-terrace, Dewsbury	"
Northallerton—Langton Grange Farmhouse and Buildings		W. R. West, Solicitor, Thirsk	"
Keighley—Eight Houses at Stoney Bank, Skipton-road		Robert Tomlinson, Builder, Keighley	"
Harby—24 Houses, Dushwood-street		101, Normanton-road, Derby	"
Halifax—Bowling Dyke Mills and Sheds and Haley Hill Mills and Sheds		J. S. Lees and Co., Southgate Chambers, Halifax	"

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2232.

FRIDAY, OCTOBER 15, 1897.

HYGIENIC BUILDINGS.

OUR citizens have yet to learn what health in their surroundings means. The average dweller in our towns and suburbs imagines all is done that can be done if his house is fairly well built and drained, and has a little outlet or so-called "garden" in the rear, if he is well away from offensive trades and so on. And he is right so far as things are arranged for him now. If he has to endure the hardship of a rough unmade road not "taken over" by the parish in a new estate, with all the unpleasantness of dust and rubbish in dry weather, and a mud pond to wade through in rainy weather, he puts up with it contentedly for a time at least. During the winter months he and his family remain at home as much as possible, though he has to put up with execrating wall-paper, badly-made doors, windows, and fireplaces, all ill-fitting and letting in draughts and smoke. But he does not really know what he has to endure even within his own walls. The fumes of cookery from his own kitchen, when he returns home, are at least appetising, but he little dreams that within those not unwelcome vapours may be concealed the most deadly gases as well, and that he is actually inhaling the vitiated atmosphere of the whole house—sewer gases and all other intruding enemies in gaseous form. The smell of cookery at least ought to make it clear to him that his house is badly ventilated. Again, when he sits in his parlour near a comforting fire and experiences draughts, he may content himself there is nothing like plenty of air; but is he certain that it comes from a pure source, and not through crevices and floors, and up from basements and cellars, impregnated with poisonous germs? If from the windows or front door, these currents may be pure though unpleasant, and may lead to nothing more serious than aches and rheumatic pains. We instance these common defects as showing how people are apt to disregard points which are of real importance to their health and the comfort of a dwelling house. Both these mistakes could be avoided by proper means being taken for ventilating basements and kitchen offices by separate channels, instead of allowing the staircase to become a ventilating shaft, and by providing an inlet for fresh air to the fireplace, so as to avoid the necessity for feeding the fire through doubtful channels and crevices in the floor. What can be more depressing in a house than a staircase landing on the upper floor without window or ventilator, a dark unwholesome space or reservoir filled with mephitic air, and so intensely close that a sense of giddiness and oppression seizes anyone who remains in it for a moment or two. The stopped corridor or passage leading at one end to a cupboard or closet, and having bedrooms along its route, is a veritable channel for the conveyance of vitiated air, but how common is it in large houses, hotels, and like buildings. No one thinks of altering these arrangements: they are common and convenient.

Then, on questions of aspect of light in our buildings, we are far from being perfect. The architect has not, it is true, *carte blanche* in this matter: the site is often chosen before he is called in; but does he avail himself of the opportunity to give his best rooms a fair share of sunlight, especially in the morning? In a street house, of course, he has only one

choice of aspect; but in the country he can turn his building round, or so shape his plan as to catch the sun, and at the same time to avoid the cold winds. We fear it must be admitted that many a country residence has been spoiled by inattention to this fundamental essential of health, and that an ornamental elevation or a regard for picturesque grouping has been the ruling motive. How often we see windows placed on the coldest side, north or east, and the most pleasant aspect faced by a blank wall. When the ground is large enough, the architect has the option of so disposing his plan as practically to catch the sun for his principal rooms. He can dispose the wings of his building so that they both face the south-east. And he can make more frequent use of his chimneys, as a means of economising heat, sometimes by placing them on those sides of the building which are exposed to the cold winds, but always with thick walls outside the flues. We have not yet realised the art of retaining heat in our buildings. The ideal is to be able to warm oneself all round, while still retaining the open fire. Hot water and steam radiators we cannot have everywhere; but if we only modified our construction, some approach to uniform temperature might be made. By making our walls solid and without openings in the colder sides, more warmth may be retained; and is it therefore contrary to rule to suggest that we might even make our walls thicker on those sides? But routine in these matters supersedes common sense. While the ordinary Englishman shivers on his own hearth, he is actually wasting his heat and allowing it to be conducted quickly away by thin walls and roofs, or conveyed up the chimney in smoke and flame.

In our great city offices, banks, and warehouses the lives of our youths are being sacrificed by inattention to hygienic conditions or bad sanitation. Who has not seen the stifling, overcrowded shop, badly lighted and ventilated by day and over-heated by gas-burners by night, crowded by young men or women, whose weary frames and tired, aching heads betray the pernicious inhalation of a vitiated atmosphere. One or other extreme has to be combated. In one shop we find it dark and dingy at the inner end; there is no light save a small skylight, and the lamps are burning all day and night. No ventilating arrangement is seen, and, if existent, it is not put in operation. The air-space is reduced by bales of goods, and the air has to be re-breathed over and over again. In another, the attendants, instead of being broiled in an atmosphere rendered impure by the products of combustion, have to endure the torture of a constant draught, aggravated every time the doors are opened by customers, or the over-heated attendant is exposed one minute to the temperature of a bath-room, and the next moment to a current of cold air. Or, if we enter a City bank, full of clerks, we hear complaints, at this season, of intensely cold feet, while their heads are close to powerful gas-burners which seriously impair their eyesight and their health. The underground warehouses and gas-lighted saloons are even worse instances of these defects. Again, are not our industrial dwellings in flats means of spreading infection, should any epidemic break out? They have been instanced as veritable incubators of disease, the "flat system" favouring conditions which are known to be injurious. The staircase shaft, common to every group of dwellings, has the drawback of communicating the contagia of any case in the block despite the utmost precautions.

Not only in the building, but in the planning, of our cities we are helplessly at the mercy of circumstances. If we had any choice, we should probably be more careful in arranging our main thoroughfares with some regard to the sun, so that at some

portion of the day they would get sunshine and warmth. The hygienist would probably plan every street with its axis north and south, or nearly so, so that the blocks of houses on either side would receive some of the beneficent rays. The best position for a row of houses is that where they face south-east; but the other side would be less advantageously placed. At any rate, the least exposure to the north is desirable. Taking the Strand, we find this condition well satisfied on the north side, while Fleet-street runs in a more direct east and westerly direction, and in most of our great towns this is the general trend of the main streets. The influence of direction in the laying-out of our streets is an undoubted hygienic factor, and we have several arrangements—first, the irregular and indeterminate plans of our old cities, London and York, for example, where there are one or two main streets intersected by others promiscuously; the rectangular system, as seen in New York, Philadelphia, and other cities of the States; the radiating system observed in the newer parts of Paris; and, more particularly, the "spider-web" plan seen in Vienna, where a belt of spacious boulevards or rings encircle the old city or Stadt. For architectural effectiveness the radiating plan stands high, especially when the streets are wide or there is a ring-space round the city, as in the Ringstrasse of Vienna. Is there not something health-giving and exhilarating about such noble spaces as the Place de la Concorde, from which stretches in stately perspective the beautiful avenue of the Champs Elysées, wooded on either side; or the intersecting Rue Royale, terminating in the great Classic church of the Madeleine?—Right through the very heart of Paris flows the river Seine, fringed by the garden of the Tuileries and the spacious court of the Louvre. In London we have also the more spacious Thames with its newly laid out boulevard or embankment, dividing the seething masses of a vast population, bringing sunlight and air. These arteries have made the cities of Paris and London what they are; but they have been supplemented by spacious places and squares and parks, which are practically "lungs" to the inhabitants. Whether river or boulevard, ring or platz, these are the chief means by which our city life can be made at least tolerable, and invested with the air of health and beauty. But there are other, though less conspicuous, means. One of these is the arrangement of our town dwellings. If we have plenty of parks and open spaces in our midst, so have we a surrounding mass of overcrowded dwellings, with in many cases no outlet, except yards, for light and air. The tendency is to build higher buildings, and at the same time to render useless large areas of ground that have been swept clean of the poorest dwellings, without making any corresponding effort to provide tenements for the displaced masses. Is not this the case in the lately-demolished areas north of the Strand, Covent Garden, Drury-lane, Clare Market, and other parts? Old and unsanitary houses have been removed; but, to the discredit of ground landlords, no adequate accommodation has been made for those who are compelled to live near their living or market. The consequence is that the remaining houses and lodgings become densely packed by labourers who are obliged to remain in a certain district. The huge blocks in flats become thronged, certainly the most dangerous form of overcrowding. Dr. Poore, in a recent work, has opened the floodgates of his wrath on these buildings, and he is not alone. The fact is that the cubic contents is too great for the area of the building in the case of a several-storied London house; it entails enormous labour, as he says, on the servants—a fact that may be proved mechanically by considering the "work" done by a servant in

mounting the stairs with the weight of her supplies, which, at a moderate reckoning, he says is about four "foot-tons." To some extent the same argument applies to the tall block of flats, where the tenant has to climb 60 to 100 steps. The exertion or the wasted energy must tell cruelly on the ill-fed labourer and his wife, especially when sickness assails the family, and it ought to be enumerated among the non-hygienic conditions of tall buildings.

The building regulations in London have favoured the cubic capacity development of building. The space provided in the rear of new houses in new streets (150sq.ft.) is ridiculously inadequate, and, worse than all, it may be covered over in some cases by a shop. Then the rule as to an angle of $63^{\circ} 5'$ allows the house to be twice its depth in height, both of which regulations permit the erection of houses of large cubic capacity. But what is worse is that the Council allow houses to be built as high as 80ft., or even higher if consent is given. Thus it is that the Building Act in London at least encourages the erection of lofty buildings, and makes sanitation impossible except by providing certain fixtures and drainage; and the "model" by-laws of the Local Government Board are very little better. What may be necessary in London by no means ought to be right in the country, where land is cheaper. Strange to say, however, the open yard spaces for houses 25ft. high is preposterously small—25ft. deep, the same depth being allowed for houses up to 100ft. Such are a few of the causes which militate against hygienic buildings in our towns. Our open spaces may be ample; but the regulations in force are inoperative as to buildings which abut on a front and back street, or which are built round large spaces. With one hand we lavish money on wider streets and open spaces, with the other we practically drive the masses of our town into dwellings and blocks of flats upon concentrated and smaller areas, and this process is going on year by year.

PROVISIONAL AMOUNTS.

IN the specification for a building to be carried out by contract, it is very usual to stipulate that the contractor shall provide a certain sum of money in his tender for a particular purpose, or the prime cost of the article is specified, the object of which is to avoid anything inferior being introduced, as would probably be the case if the cost were left to the contractor to do as he pleased. Sometimes manufacturers are selected who affix their own prices for the work. Without these precautions there is a temptation to evade the letter and spirit of the provision, to get a price quoted that will enable the contractor to make a profit out of the transaction. Suppose it is an iron verandah. If the contractor can get an iron-firm to supply the work according to the specification at the lowest price, or, what is sometimes done, to obtain a price from the manufacturer who gives the largest trade discount, no one will be any the wiser; but the employer will be the loser, and get a structure of inferior make. It may be a piece of decoration or carving for which no definite provision is made, in which case there will be a large margin for any dealings of this kind. To prevent any such transaction, the custom of specifying a sum is adopted, and this sum is extended in the bill of quantities, and included in the tender. Even in the various trades specified, it is a good plan to insure completeness by inserting clauses after all trades about which there may be any doubt, as, for example, "Provide and fix under the contract—cubic feet of stone," or "—feet of plain work." But the provisional amount is a special matter which ought to be under the architect's control. One of the chief reasons why certain amounts are stated is that the

architect or owner may use his own discretion in selecting the article, and in seeing that the design is properly carried out. If the article is priced in the ordinary way, by the contractor, he naturally exercises his own taste, subject to the architect's approval. The latter is apt to approve or pass what he has no power to interfere with. Let us take the iron verandah as an instance. Smith, the contractor, goes to a few large manufacturers, and selects the one from whom he gets the largest consideration. Of course, the design and quality are of a kind kept in stock, or, if the architect's design is followed, the iron merchant is allowed to use his own discretion as to details and sizes. The architect cannot interfere with the result. Or suppose it is a supply of stoves;—what is easier than for the contractor to obtain quotations from a few firms? The patterns may be selected by the architect or owner; but, of course, they have no choice as to design, which is limited. In both these instances the owner would have been the gainer if he had kept these fixtures on his own hands, or had left them to his architect, and the character of the building would have been preserved. When the question is a piece of metal-work, say a grille, which the architect wishes to be executed from his own design, or the decoration of a building, over which he desires to exercise his taste, it is utterly futile to depend upon the contractor carrying out the work to give perfect satisfaction. The only way is to place the design into the hands of an craftsman who will comply with its spirit. The designer must be brought into immediate touch with the craftsman. These are points patent to all architects who wish to see their designs carried out in their integrity, and we only refer to them here because modern tendering has made it so fatally easy to ignore them. The so-called "art-furnisher," with all his blandishments, is now filling up the gap between the contractor and the genuine artist, and his goods and prices can be quoted "on 'Change." The late Geo. Gilbert Scott said art will be bought only by commission when honesty and happiness has a quotation in the stock and share list; but we have now a substitute for good and honest workmanship which can be quoted as easily as the price of bricks, and what is worse, it is elastic. The art-furnisher is willing to supply anything, to suit his price to the requirements of the purchaser. These are the facilities which have made low tendering so successful. If our architects wish to reserve to themselves more control over their designs, they can only do so by means of providing specified sums for particular works. But in the adjustment of these sums there is much misunderstanding. A correspondent in our "Intercom." column put a question the other day which shows that the practice is not uniformly understood by contractors. "Surveyor" instanced a case in which a contractor had made the mistake of extending the amount of £50 in the money column for a sum of 50s. provided for unforeseen work, but allows only the latter; and he asks for information whether the £50 can be claimed for his client. Another correspondent very reasonably considers the provisional sum a "fixed" sum entirely under the architect's control, for if the tenderer ignores it, and gets thereby a contract, why should the client have the cost of his building increased, or suffer by it not being done through the builder's neglect or wilfulness? Therefore he considers that if a certain amount is stipulated for something to be done, nothing more or less should be considered when squaring up the contract; if he increases or omits it, it is entirely the contractor's own affair. No doubt this opinion will be generally acceptable to the profession, for if a contractor puts down a larger sum than provided, and does not use it, the owner ought certainly to obtain the

correction in his favour. If a man pays his butcher or his tailor more money than the debt amounts to by mistake, he naturally expects the tradesman will be honest enough to repay the difference, and so with a builder who undertakes to build for so much. Still, there is a doubt whether a total amount of tender can be interfered with after the contract is signed. Tenders are to be dealt with as totals; but before the contract is signed the items of the quantities should be examined. By this means of testing or checking the castings and extended amounts, all errors are expunged, and it would be almost impossible to find a provisional sum placed in the wrong column. Much difficulty would be averted, and the adjustment of accounts facilitated, if architects inserted special clauses as to the deduction of provisional net sums. A certain sum of money—say, a hundred pounds—may be provided for carving or ironmongery; but it is often a difficulty to adjust the amount as to what has to be paid to contractor at the completion of the building. The invoice should be obtainable, and when the trade discount (perhaps 20 per cent.) and profit are known, there ought to be little trouble in arranging the amount. Most surveyors adopt certain rules as to these deductions or additions. Sometimes the contractor fixes his own profit, say, 5 per cent., and adds it to the sum extended in the bill, which will appear as "Provide for ironmongery £105, &c." Then it is only necessary to deduct this amount, making the necessary allowances for discount from invoice, but adding the profit. Having the invoice amount, these adjustments can be made without any difficulty. Perhaps the more satisfactory way is for the whole amount to be spent by an architect and deducted from the contract, which saves much trouble in the adjustment of the accounts at the end.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—VI.

By AN ASSOC. INST. ELECT. ENGS.

GENERATORS CONTINUED. — Direct-current dynamos differ, as regards type of machine, by reason of the various methods of winding the magnets, and the different arrangements and number of pole-pieces which may be employed. When we remember that the function of the magnets is to provide an intense magnetic field in which the armature rotates, and also that generators are now employed for a great variety of purposes, necessitating high and low pressures, constant currents at varying pressures, varying currents at constant pressures, and high efficiencies both for full and light loads, it is evident that the ingenuity of the engineer has had full scope, even if not taxed to the full, to meet the many demands made during the period of development, both of lighting and the transmission of power plants. The announcement of Faraday's discovery of induced currents was like the setting-off of fire to an inflammable substance. The latent energies of many engineers were aroused, and one of the most efficient machines ever constructed—i.e., the dynamo—is the result. In the earliest machines permanent magnets were used; but these were costly to build up, and they were also liable to a gradual diminution of strength. Consequently, more progress was made after Wilde, of Manchester, supplanted the permanent magnets by using electro-magnets, the current for the coils of which was supplied by a separate machine of the older permanent magnet type. Wilde's type of machine is known as the separately-excited machine, of which, in so far as the excitation is concerned, the modern alternator is an example. The most important improvement, however, was that of dispensing with the permanent magnets altogether, and it is somewhat remarkable that the idea which gave birth to the principle upon which all modern machines (continuous-current) are constructed, occurred independently to Mr. Varley, Sir C. Wheatstone, and Dr. W. Siemens thirty years ago (1867). They proposed simultaneously to utilise the current produced by the machine itself for the purpose of exciting its own electro-magnets,

FIG. 10.

and thus introduced the self-exciting or mutual accumulation principle. This principle is based upon the fact that iron, when it has been magnetised, retains almost permanently a small amount of residual magnetism. A moment's reflection will suffice to show that this residual magnetism maintains a state of stress around the armature at all times, and thus at the very commencement of a run the armature will rotate in a magnetic field, which, although weak, enables a small current to be produced in the armature if the circuit be closed. Then all that remains to make use of this current for magnetising purposes is to connect the brushes to the coils of wire forming the electro-magnets, with the result that the magnetism will be intensified. A stronger magnetic field gives rise to a corresponding increase of current, and the process of using the current produced to intensify the magnetic field very quickly enables the machine to become properly excited and to render the energy required. It must, however, be observed that although this compound interest principle is applied in self-exciting machines, a limit exists to the increase of the magnetisation of the cores of the electro-magnets. When the iron is magnetised to saturation an increase in the exciting current does no good. It is for this reason that a limit to the output of a generator exists.

We may also mention in passing that the shape of the field-magnets varies considerably; but, as this is a matter for the designer to consider rather than the user, we shall not do more than give sketches of the more common forms. Broadly speaking, there are two general types of field-magnets, known as the bipolar and multipolar types. The bipolar is represented by figures *a*, *b*, *c*, and *d* in Fig. 10; whilst *e* and *f* represent the multipolar. *a*, *b*, and *c* are typical of single-magnetic-circuit bipolar field-magnets, and *d* of the double-magnetic-circuit bipolar field-magnets.

For our purpose, however, the method of winding the field-magnet coils is of more importance than the disposition and shape of the iron parts, since by arranging the exciting coils of a generator in a certain manner relatively to the armature coils and the external circuit we can produce that particular kind of regulation most suitable for the work that has to be done. In fact, continuous-current dynamos are usually classified according to the method of exciting the field-magnets, with the result that we have the series-wound machine, the shunt-wound machine, and the compound-wound machine.

The Series-wound Dynamo.—As is probably well known, arc lighting was introduced at an earlier date than incandescent lighting, and as the number of arc lamps required at first was comparatively small, the primitive and simplest method of connecting them in series (see Article IV., page 466) was found convenient, and was universally adopted. The dynamo used exclusively at that time for arc lighting had its field-magnets excited by the full armature current, which was taken directly from the armature around the field-magnets, and thence to the external circuit (arc lamps in series) back to the armature. A machine excited in this way was found particularly adapted for series-lighting. Such a machine is shown in Fig. 11, from which

it will be observed that there is only one circuit, which is composed of three parts—the armature coils, the field-magnet coils, and the external portion. These are connected in series, and since

FIG. 11.

the field-magnet coils are connected in series with the armature, this type of generator is termed a series-wound dynamo. This is obviously the simplest way of producing self-excitation, as the whole of the current produced passes round the field-magnets. The section of the wire forming the magnet coils must, therefore, be large—consequently the number of turns will be few.

It is clear that since the complete circuit (including the parts of the generator and the lamps) is a simple series circuit, the current strength will be the same at all points; further,

FIG. 12.

arc lamps take usually 10 ampères, therefore the series-wound machine must be a constant-current generator. And, although the number of arc lamps alight at one time is usually constant for any particular circuit, there are times when the number varies, and in all cases means exist for preserving the continuity of a circuit should a lamp be turned off. It is therefore evident that a series-wound machine is required to give a constant current, and at the same time to vary its terminal pressure. The exciting current is, of course, constant, and the entire variation of

FIG. 13.

E.M.F. required is produced by changing the position of the brushes on the commutator. Again, from what we have said previously, it is known that the total electrical pressure or

terminal voltage of a dynamo to light n arc lamps connected in series will be n times the pressure required for each lamp, and since each arc lamp requires at least 50 volts, it follows that the series-wound dynamo is a high-tension machine. Modern arc-lighting dynamos give from 1,000 to 3,000 volts; but even with these pressures there is considerable difficulty in insulating the commutator segments—consequently generators for more than 3,000 volts are not constructed. It will be seen now why arc lamps are connected in series. A wire which will carry 10 ampères is all that is required to connect the lamps, and since the voltage is high, the high resistance is readily overcome, and a great saving in the cost of copper in the line is the result.

The main objection to the series-wound dynamo is that it does not start action below a certain speed, or if the external resistance is too great. It furthermore possesses the disadvantage of being liable to reverse its polarity should the speed fall when there is any source of counter-E.M.F. in the circuit. Consequently it is altogether unsuitable for charging accumulators, or for electro-metallurgical work generally. This type of dynamo also does not automatically regulate itself to the work it has to do. Thus, for instance, if several lamps are turned off simultaneously, the resistance of the external circuit falls, and the current increases; but an increase in current strength means increased excitation, and consequently a higher E.M.F., when really less is required, because of the diminution in the number of lamps. This necessitates the regulation at the brushes already referred to. It is obvious that immediately the circuit is broken at any point, the excitation is removed, and we get no current on open circuit. On the other hand, however, if the terminals of the machine be short-circuited, the intensity of the resulting current is enormous.

Shunt-wound Dynamos.—A little reflection will suffice to show that when incandescent lamps were introduced some modification of the series system was necessary. In the first place, the number of lamps used in an installation was materially increased, and, inasmuch as the voltage required by each lamp was from the first 100 volts, it is clear that the limit of 3,000 volts for a series machine was soon reached, and a different method of arranging the lamps was soon devised to overcome the difficulty. The way out of the difficulty was to connect the lamps in parallel (see Article IV. p. 466) between mains maintained at a constant potential by constant-potential generators. These generators differ from the series-wound machines in having many turns of fine wire wound on the field-magnets and connected as a shunt—i.e., in parallel—with the main circuit. For this reason they are termed shunt-wound dynamos, and the arrangement of the coils is shown in Fig. 12, and it must be observed that, by making the resistance of the shunt coils great, the greater fraction of the armature current will flow through the external circuit, since there is the choice of two paths, and

$$\frac{c_s}{c_e} = \frac{r_s}{r_e} \text{ and } c_s = \frac{r_e}{r_e + r_s} C_a \text{ (see p. 466)}$$

where c_s , c_e , and C_a are the currents in the external circuit, shunt circuit, and armature respectively, and r_e and r_s the external and shunt resistances respectively.

With this type of machine, designed to give constant pressure, it is clear that the excitation will approximately be the same if the pressure at the brushes is constant, and in tracing the changes which take place during a fluctuation in the load, we must remember that the external resistance decreases as we increase the number of lamps alight, and increases as we turn lamps off, because the lamps are connected in parallel. This gives a fairly automatic regulation so far as current is required; but it is clear that the arrangement tends to diminish the E.M.F. as the load increases, partly because less current passes round the field-magnets. To overcome this change in the pressure, an adjustable resistance is usually added in the field-magnet circuit, so that the excitation may be varied to suit the circumstances. The shunt-wound dynamo is also suitable, and much used for chemical and electro-metallurgical work, since there is no possibility of this machine reversing its polarity. Therefore, the shunt-wound dynamo should always be used for charging accumulators and in plants where accumulators are used.

Compound-wound Dynamo.—As we have indicated, some regulation is required both with the series and with the shunt-wound dynamo, and

when hand-regulation is not desirable, the generator may be made automatically regulating by making use of a combination of the series and shunt winding. Such a machine is known as the *compound-wound dynamo*, and is shown in Fig. 13. By adopting this method of winding we obtain all the advantages of the series and shunt-wound machine, and since the excitation due to the series coil varies with the main current and that due to the shunt-coil is proportional to the terminal voltage, the compound-wound machine is perfectly self-regulating for constant pressures. Such a machine is, therefore, useful for isolated plants.

THE ARCHITECTURAL ASSOCIATION.

THE fifty-first session of the Architectural Association was inaugurated on Friday evening at 9, Conduit-street, W., when there was a large attendance of members and visitors, including several ladies. The newly-elected President, Mr. Hampden W. Pratt, F.R.I.B.A., who also retains the office of honorary treasurer, which he has held since 1888, was greeted with hearty applause on taking the chair.

Mr. A. BERESFORD PITE, the retiring President, proposed, and Mr. FRANCIS G. F. HOOPER seconded, the adoption of the report for 1896-7 and the balance-sheet, which were taken as read, Mr. Pite remarking that the work of the past session had been, on the whole, very encouraging. The past year had seen the largest membership roll yet recorded, there being a net increase of 77 members, bringing the total to 1,190. All the classes had been maintained in a healthy condition; but some of them were a little anxious as to the future of the Advanced Class of Design, which was formerly one of the most interesting, and which they hoped would be well supported this session. As to that hardy annual, the question of the acquisition of new premises, it had now become a little more definite, for the special committee of past-presidents convened to arrange for the celebration of the A.A. Jubilee in May last had the matter in hand, and hoped to be able shortly to announce that this had been made a permanent memorial of that occasion. Financially, the Association was now in a very good position; but it must not be forgotten that the classes were conducted on an unremunerative scale, and that they were dependent on their friends to make ends meet.

The motion was carried unanimously.

On the motion of Messrs. BANISTER F. FLETCHER and E. HOWLEY SIM, a vote of thanks was passed to the hon. auditors of the accounts for the past session, Messrs. H. P. G. Maule and Matthew Garbutt, and Mr. SIM also proposed a vote of thanks to Messrs. H. T. Hare, G. H. Fellowes Prynn, and A. Hessel Tiltman for permitting visits to works in progress during the summer. This was also unanimously accorded.

PRESENTATION OF PRIZES.

The President then proceeded to distribute the medals, prizes, and certificates gained by students during the past session, in accordance with the following list:—

A.A. Travelling Studentship, value £25, and bronze medal, E. H. Evans; second prize, not awarded. Architectural Association Silver Medal and £10 10s.; H. Inigo Triggs; hon. mention, F. Dare Clapham. Essay Prize, value £10 10s., and silver medal, Alexander Wood.

The Andrew Oliver Prize, 1st prize (value £3 3s.) and 2nd prize (value £2 2s.), not awarded.

The Arthur Cates Scholarship, value £10 10s., H. T. Bromley.

Measured Drawings Prize, value £5 5s., C. H. F. Conyn; hon. mention, H. Faquharson.

Discussion Section Prize and Architectural Union Company's Prize, not awarded.

School of Handicraft (Masonry) Bronze Medal, H. C. Lander.

LECTURE SIDE.—Division I.: R. H. Spalding (silver medal and certificate), A. Wood (bronze medal), H. White (hon. mention). Division II.: G. S. Nicol (silver medal and certificate), H. C. Trimmell (bronze medal), E. Hale (hon. mention).

STUDIO SIDE.—Division I.: V. Wilkins, silver medal and certificate; T. Bee, bronze medal; R. H. Spalding, hon. mention. Division II.: W. H. Ward, silver medal and certificate.

ORDER OF MERIT.—Division I.—Greek and Roman Orders: C. Brée (certificate), H. White, J. E. Franck. Elementary Construction and Materials: C. Brée (certificate and book), W. C. Butterworth, W. J. Davies. English Architecture: Alexander Wood (certificate), J. E. Franck. R. H. Spalding. Elementary Physics, Formulae, and Calculations: J. E. Franck (certificate and book), R. H. Spalding, H. White. Plane and Solid Geometry: R. H. Spalding (certificate and book), R. C. Hall, J. E. Franck. Mensuration, Land Surveying, and Levelling: J. D. Hunter (certificate), L. G. Detmar, R. H. Spalding. Division II.—History of Architecture: G. S. Nicol

(certificate and book), H. Badcock, S. E. Barrow. Materials, their Nature and Application: H. C. Trimmell (certificate and book), H. Badcock, G. S. Nicol. Stresses and Strains: G. S. Nicol (certificate), F. J. O. Smith, T. W. Aldwinckle, jun. Construction: P. Morris (certificate and book), H. C. Trimmell, G. S. Nicol. Hygiene (Drainage and Water Supply): F. J. O. Smith (certificate and book), T. W. Aldwinckle, jun., H. C. Trimmell. Hygiene (Materials and Construction, Ventilation, Lighting and Heating): F. J. O. Smith, (certificate), G. S. Nicol, T. W. Aldwinckle, jun. Specifications and Estimates: S. E. Barrow (certificate), H. C. Trimmell, T. W. Aldwinckle, jun. Professional Practice: T. W. Aldwinckle, jun. (no certificate awarded, as only seven students entered in lieu of a minimum of eight, as prescribed by the rules), G. S. Nicol, S. E. Barrow. Elementary Class of Design: F. N. Reckitt (silver medal, with scholarship value £5 5s. and certificate), C. L. Brierley (bronze medal and certificate), T. F. Green (hon. mention and certificate), J. S. Lee (hon. mention).

PRESENTATION TO MR. D. G. DRIVER.

THE PRESIDENT said he had now a very pleasing duty to perform—that of making, on behalf of the committee and instructors and some few members, a small acknowledgment of the active services rendered the Association by their friend, Mr. D. G. Driver, their assistant secretary and registrar. They found that when Mr. Driver returned from his holiday in August he had brought back with him a lady, and they felt it would be pleasant to express their good wishes for Mr. and Mrs. Driver's happiness, and to make some little recognition of the services which their friend had so continuously and faithfully rendered during the past five years, in which period he had done an enormous amount of work. Uncovering a handsome silver tea and coffee service, the President formally presented them, expressing at the same time the best wishes of all for Mr. and Mrs. Driver, and the conviction which all felt that he would serve the Association as faithfully in the future as he had done in the past.

Mr. DRIVER, who was warmly cheered, acknowledged the presentation in a few well-chosen words, and remarked that in the discharge of his duties he had been helped very materially by the good fellowship which existed among the members.

REINSTATEMENT OF MEMBERS.

The following old members were reinstated:—Messrs. G. H. Smith, F. A. Lamb, A. W. Pocock, jun., A. Lovejoy, G. E. Withers, A. G. Turner, and G. Bailey; and a long list of nominations for membership was read.

The PRESIDENT then delivered his

INAUGURAL ADDRESS.

There are certain periods, he observed, in the history of an institution when it is convenient and customary, not to say interesting and instructive, to review the past; also to consider the present, and look forward to the future. For fifty years the Architectural Association has striven to supply the needs and promote the welfare of the architectural student, and it must be very gratifying to the founders of the Society, a few of whom happily survive, to look upon the flourishing body that still bears the name of the Architectural Association.

THE OBJECT OF ESTABLISHING THE ASSOCIATION

was "to enable young men who are studying architecture to meet for general improvement in the various branches of their art." In a circular issued at the origination of the society it was pointed out that "the great advantages a scheme like this, if carried out, would offer to the architectural student, must be obvious at a glance. By this institution all the future members of the profession, their objects, their labours, their studies, would become known to each other. The incalculable advantages this knowledge and acquaintance would afford to those engaged in the same study; the mutual instruction and valuable assistance each could afford, the honourable spirit of emulation that would be engendered; the furtherance of their art in general, and the happy effect that must be produced by all the future architects becoming a band of friends, intimately associated with each other in their plans and projects, must and will prove of the greatest advantage to all those connected with the scheme." This forecast has been

FULFILLED TO THE LETTER,

and we may truly say that the bonds which unite us to-day are as strong and as powerful as ever they were. There is scarcely anything recorded of the early years of the Association. Its proceedings were not reported as they now are, and it is mainly through the unpublished minutes of its

meetings that we are able to glean something of its history. The question of public competitions seems to have been early considered, for in 1850 a code of regulations was drawn up and issued; this interesting document contained some excellent suggestions which the agitation of many years has not succeeded in satisfactorily settling. As evidence of a desire to enlarge its scope, we find that Mr. R. Kerr, in 1852, laid before the committee a scheme for the formation of an Architectural Academy, comprising courses of study, professorships, lectures, graduation, &c., and a resolution was passed to the effect that "the proposition is well worthy the consideration of the profession generally, and that any assistance towards the furtherance of this object that can be rendered by the Association shall be liberally given." Unfortunately,

FINANCIAL TROUBLES

proved a stumbling-block to the smooth working of the society, chiefly owing to the members getting into arrear with their subscriptions—an experience not confined, by the way, to the infancy and youth of the Association, as subsequent treasurers can testify; but it led to the appointment of a committee of investigation in 1855. This committee reported that they "found the Association in a state of apathy, torpor, and depression unparalleled in former sessions"; the financial statements had been misleading owing to the concealment of heavy liabilities, and the management of the Society called for improvement. It was further suggested that a lending library should be formed, and an "Architectural Association Magazine" might, if published, be expected to pay its own expenses. The report concluded with an earnest appeal for a renewal of the enthusiasm which characterised the members at the formation of the society. Following closely upon the reception of this report came a proposal to

MEMORIALISE THE INSTITUTE "FOR THE ESTABLISHMENT OF AN EXAMINATION"

which should eventually serve as the basis for the issue of such a diploma as shall certify that the holder thereof is fully qualified to practise as an architect." A reply was received from the Institute in 1856 to the effect that the council felt it was premature to pronounce an opinion upon so important a subject, and that before they could recommend the Institute to undertake such a charge, it would be necessary to ascertain the opinion of the profession generally; at the same time they would be able to come to a sounder judgment after some experience of the District Surveyors' Examination recently instituted. Disappointment followed this decision, interest in the society continued to flag, and in May, 1856, a special meeting was held, at which a resolution was brought forward to terminate the existence of the Association; this, however, was defeated by a large majority, thus indicating that there was, at any rate, some vitality amongst the members. In the following month an important letter was received from the Institute suggesting an amalgamation of the Association with that body. This communication was duly considered, and a resolution passed to the effect that it is not expedient for the Association to join the Institute on the terms suggested. The crisis through which the Association passed in 1856 was followed by an awakening interest in its welfare, and a committee was appointed to take into consideration the defective means of architectural education and the desirability of forming classes for the special study of subjects immediately connected with professional practice. In January, 1857, a *conversazione* was held, at which Mr. Ruskin was present, and read a paper on "The Use of Imagination in Modern Architectural Design." Mr. Ruskin said: "If they were asked abruptly, and required to answer shortly, what were the qualities which distinguished great artists from mean artists, he believed they might reply: first, their imagination; second, their industry. Some of them might doubt the justice or the necessity of attaching so much importance to this latter quality, because there might be dull men who were industrious, and clever men who were indolent; but though the industrious man might be dull, and the indolent man might be clever, he had never known a great man who was not industrious. But though this quality of industry was essential to an artist, it did not make an artist; for many people were always busy whose doings are of little worth. Neither did feeling make the artist; but the gift which distinctly made the artist—

without which he would be feeble in life and forgotten in death,—was that of imagination. Imagination was not manipulation, or calculation, or attention; it was something more, something higher than all or any of these. If an architect lays his bricks and stones well, we praise him for his manipulation; if he keeps well within his contract, we praise him for his calculation; and if he arranges his beams so that nobody drops through his floors, we praise him for his caution. But, if he is to be a great architect, he must do something more than possess and exercise these qualities." Concluding an eloquent address, Mr. Ruskin said, "So soon as they desired to build largely, they would find that their work must be associative; one could not carve a whole cathedral himself: either their own work must be disgraced, or they must raise their fellow-designers to some correspondence of power. They would take the lead in disposing of their building; but they must trust to the genius and invention of others in the disposal of its detail; and in doing this, too, they must rejoice in the very powers that may promise to rival them. If they endeavoured to depress or disguise the talents of their subordinates, they were lost to their art, for it was their own prosperity they were seeking, and their own skill that they were striving to perpetuate. He placed no utopian standard before them; he had said that they must surrender their own pre-eminence to their love of building, and whomsoever they found better able to do what would adorn it than they were, that person they were to give place to, and rejoice at seeing their edifice growing more beautiful under his chisel, and next rejoicing that they had done kindly. The man who sees capacity in another, and does not acknowledge it, or assist in bringing it forth, is not the refuser of a kindness, but the committer of an injury. They had the sweet consciousness that as their art embraced a wider field than all others, so it was more profound and holy than all others. The artist, when his pupil is perfect, must see him leave his room that he may pursue his destiny perhaps as an opponent in toil; but architects alone were called by kindness to fraternity of toil. Those massive piles which rise above the domestic roofs of our ancient cities have a meaning more profound and true than is commonly attached to them. Men say they are good for worship—but so is every mountain, glen, and rough sea-shore; they have the indisputable and distinguished glory that their mighty walls were raised by men who have given aid to each other in their weakness, and the strength of their structure has its foundations on manly friendship, which conduces to awaken the sweeter cadences and symmetry of the human soul." What effect

MR. RUSKIN'S ELOQUENT ADDRESS

had on the members is not recorded, but it is pleasing to find that the committee were able at the commencement of the next session to congratulate the members on the general improvement which had taken place in the prospects and financial position of the Association, which was at length freed from its embarrassments, a fund having been raised for the purpose. A movement was on foot at this period to provide a home for architectural bodies in London; the Architectural Union Company had been formed and was erecting a building in Conduit-street, and, after prolonged negotiations, the Association removed from Lyon's Inn Hall, holding its first meeting at 9, Conduit-street, on April 1, 1859. In that year, for the first time, a prize was awarded in the Class of Design, and a Prize Essay instituted, the subject being "Street Architecture and its Proper Treatment." The acquisition of new premises might have been expected to mark a renewal of vigour in the work of the Association; but, strange to say, only twelve months had elapsed when a resolution was passed regretting the want of support afforded by the members, and asking the committee to consider and report whether there was any course short of closing its operations. The committee recommended that all office bearers, with the exception of three, should for the next session be members who had never held office before; accordingly some new blood was introduced into the direction of affairs. A circular having been issued by the R.I.B.A., inviting suggestions on the establishment of a

VOLUNTARY EXAMINATION,

the Association held two meetings at the close of 1860, and after fully discussing the matter passed two resolutions:—(1) "That in the opinion of the Architectural Association a strictly voluntary

examination should be instituted with a view of guiding the student in architecture to such a course of study as would enable him to arrive at competence in his profession." (2) "That in the event of a professional examination being insisted upon, it should be limited to those subjects which bear directly upon the practice of the profession, and this Association is apprehensive that any examination upon the principles of taste might lead to results unfavourable to the progress of art." In 1860 Botany and Modelling classes were formed, the latter proving very successful. In 1862, the library, which had been in course of formation for some time, was at length opened. In the same year, Saturday Afternoon Visits were organised, the first being to Westminster Abbey, a prize being given for the best account of the visit. At the conversazione in October, 1862, a musical programme was introduced for the first time, the services of the artistes being gratuitous. In 1863 the Voluntary Examination Class was established for the study of practical subjects, with special reference to the examination then instituted, the Association having pledged itself to use all its influence to induce the members to qualify themselves for it. In the following year a class for the study of Figure Drawing was formed, under the direction of Mr. (now Sir) E. J. Poynter, and was so attractive that 50 members joined it. A Water-Colour Class was subsequently started. In 1867 the A.A. Sketch Book was commenced, the parts being issued monthly at a subscription of one guinea per annum, as now, and an excellent publication it has always been. At this time the Class of Construction was formed, to carry on the work formerly undertaken by the Voluntary Examination Class; and a year later the Elementary Class of Design was started. The Association had now settled down to steady work, for in session 1868-69 a number of sub-committees were appointed, and a balance-sheet was published for the first time, showing an income of about £240 and a substantial sum in hand; it became necessary, also, to compile a catalogue of the library, and this was issued in 1869. We next come to an important report drawn up in 1869 by a joint committee of the Institute, the Academy, the Architectural Museum, the Association, and the Architectural Exhibition, on the question of establishing a

"SCHOOL OF ART ACCESSORIAL TO ARCHITECTURE."

This committee carefully investigated the scheme of the voluntary examination, and arrived at the conclusion that its failure was due to: 1. The absence of a formal certificate of having passed the examination. 2. The want of such a stimulus or pressure as would make the passing of the examination professionally necessary. 3. Inefficient preliminary education. 4. Want of system in architectural education. They accordingly recommended: 1. That a textbook or pamphlet should be prepared containing a complete curriculum of study for the architectural student. 2. That a certificate be granted to all who pass the Voluntary Examination. 3. That at some future period the membership of the Institute be made dependent on the passing of the Voluntary Examination in the Class of Proficiency. 4. That a preliminary Examination be held in elementary subjects open to all students who have been at least one year in an architect's office. 5. That the Institute should assist the Association to carry out the proposed Drawing School. 6. That a committee be appointed to compile the textbook referred to. As a result of the fifth recommendation Architectural Art Classes were established at the Architectural Museum under the management of a committee composed of representatives of the Institute, the Museum, and the Association. These classes were commenced in 1870, and comprised Figure Drawing and Architectural Ornament, the latter being conducted by well-known architects as visitors. For two years the Association contributed £25 annually towards the expenses of these classes, which, however, soon languished.

THE FIRST ANNUAL EXCURSION

took place in 1870, when Lincoln and district were visited, the party being conducted by the late Mr. Edmund Sharpe; and it may be remarked here that every year since then some fresh district has been visited. During the next ten years (1870-80) no important change or event took place; the membership grew from 500 to 800, two new classes were formed—viz., for the study of Colour Decoration and Architectural

Science, the latter being subsequently called the Advanced Class of Construction; some courses of lectures were also delivered; special arrangements were introduced for the benefit of country members in connection with the classes and library, and the Birmingham Architectural Association was admitted as a Provincial Branch. The Institute opened its Library to members of the Association under 23 years of age. New and amplified rules were adopted in 1877, and four years later the entrance fee was raised to one guinea. Additional rooms were taken at Conduit-street in 1879: the Architectural Association Medal was founded in that year and the Architectural Association Travelling Studentship two years afterwards, when a sum of nearly £700 was subscribed by past and present members to provide the necessary funds. In 1881-82 the committee thought it desirable to vary somewhat the arrangements of the classes, with a view to making them specially useful to members preparing for the new obligatory examination of the Institute, which commenced in 1882. Courses of lectures on the History of Architecture and on Construction were given, and a new Class started for the Study of Planning and Specification Writing. In 1884 a Special Education Committee was appointed to inquire thoroughly into the general organisation of the Association, with a view to

FURTHER STIMULATE ITS WORKING

and extend its usefulness, and a scheme was adopted, in 1885, for amending and consolidating the work. The main feature consisted in forming two defined divisions of study, called the Elementary and the Advanced, the former comprising Elementary Classes of Design and Construction, preceded by Lectures on History and Construction, and the latter consisting of Classes of Design, Colour Decoration, Advanced Construction, Quantities and Surveying, but no Lectures. The work was conducted by visitors, who were formed into a Committee of Advice. An attempt was made at this time to increase the subscription of members to one guinea, with the object of affording increased educational advantages; but the proposal was defeated by a small majority. In 1885, the Saturday Vacation visits were first organised, and in the ensuing session many improvements were effected in the library—viz., a new system of registration, the addition of a reading-room, and the opening of the library twice a week instead of once. In 1886-87, a Practical Class of Masonry was carried on as an experiment at the City and Guilds Institution, and a series of lectures started on Graphic Statics. A noteworthy step was the issue in April, 1887, of the first number of *A.A. Notes* at a small subscription, though it was not until four years later, when it was issued free to all members, that its purpose was more completely fulfilled. The gradual increase in the number of members and the large attendance at the ordinary meetings forced the Committee to consider the necessity of providing better accommodation, and by the kindness of the Institute we were permitted to hold our meetings in their room during Session 1887-88—a privilege which has been courteously extended to us ever since. About this time Rules were passed to facilitate a scheme of affiliation, with the desire of creating a bond of union between the Association and provincial societies; the Birmingham and Glasgow Associations joined us, but the arrangement did not long exist. An Elementary Class of Ornament and Colour Decoration now appeared and was well taken up, and two years later the Sketching and Measuring Class was formed for the purpose of visiting buildings in the neighbourhood of London during the summer. At the same time an A.A. Cycling Club was organised with the object of making runs to places of architectural interest; but this club soon disappeared, and notwithstanding the growing popularity of cycling no attempt has been made to restart the club. Another club was founded in 1888—viz., the Lyric Club, one of the objects being to promote friendly intercourse among the members; and those who appreciate the social advantages of music, dancing, and smoking are still provided for at this club. Reference may be made here to the Camera Club, though founded at a later date (1893). Apparently, this club is not so prosperous as it was at first, and a hope may be expressed here that some effort will be made to revive its usefulness. We have now arrived at the last great movement in the Association. In 1889 a

SPECIAL COMMITTEE ON EDUCATION

was appointed, and after exhaustive inquiries its recommendations were approved by the general body in May, 1890. Following this, a special committee was appointed to consider the revision of the rules, a new constitution and by-laws being adopted by the general body in the following January. These included the raising of the entrance fee to two guineas and the subscription to one guinea, to all members elected after 1890: and also provided for the appointment of paid officials. A reorganisation committee was next appointed to prepare the new education scheme, and resulted in the new curriculum. In order to establish the new scheme and provide for the extra cost and risk incidental thereto, as well as the outlay involved in obtaining suitable premises, an appeal was issued and generously responded to by members of the profession. The scheme provided for a complete course of study extending over four years, that being considered as the least time that should be given to the study of the subjects. It was laid down that the aim of the courses was to help members to fit themselves for their work as architects, by providing the means by which they may supplement the training acquired in offices; the principal object not being to prepare candidates for the examinations, although the courses were chiefly based upon the programme of the examinations. Premises having been secured in Great Marlborough-street, and adapted to meet our requirements,

THE NEW SCHEME

was launched in 1891-92. From the outset the first and second year's courses were well supported, the third being thinly attended, and the fourth not fully started. In 1892-93, Divisions I. and II. continued to be well supported, and Divisions III. and IV. showed improvement. In 1893-94 there was a poor attendance in Divisions III. and IV., indicating the necessity of rearranging these divisions. In 1894-95 the complete course was arranged in three divisions, but the attendance in Division III. was again disappointing, and a special committee was appointed to inquire into the working of the classes. As an outcome of this inquiry the Institute agreed to alter the dates of the examinations so as to avoid interference with the working of the classes. In 1895-96 the curriculum was arranged in two divisions, the complete course extending over four years, and a School of Design started, being attended with considerable success. Last session the work of the classes and studio showed a continued improvement, especially in Division I. The School of Design and Handicraft was most successful and encouraging; forty students joined the Elementary Class, and the whole session was devoted to one subject, which produced good results. Eight students joined the Advanced Class, the syllabus of which was amended, as it was found desirable to have more than one subject. The Technical Education Board arranged special handicraft classes for the school, and these were appreciated by the students. The Discussion Section affords opportunities for the study and discussion of those subjects and difficulties which occur in actual practice: this is a most valuable part of our work, and it is gratifying to note its continued success. A record of the Association transactions would not be complete without a reference to the Special Meeting held in December, 1893, when the question of the

ADMISSION OF LADIES

into membership of the Association provoked a lively discussion, and the proposal was defeated by a large majority. Since then no one has come forward to advocate the cause of the ladies; but we have, on several occasions, been reminded of the existence of such a class of students on the boards of the A.A. Soirée stage. We have now traced in outline the work and progress of the Association during the fifty years of its existence. The history of the Association is marked throughout its career by a fixed determination on the part of its members to maintain its independence, to uphold its traditions, to overcome all difficulties, to grapple with changing circumstances, to keep abreast of the times, to seek the counsel of its best friends, to encourage and help the young student, to provide the best training and education at its command, to keep in touch with those who have passed through the student stage, to keep alive the memories and maintain the friendship of those who have retired from active ser-

vice, and, above all, to advance the noble art of architecture. May the same devotion and self-sacrifice, the same enthusiasm and loyalty, characterise the men who are entering our ranks to-day, so that the Association may accomplish in the future greater things than in the past, and heaven smile upon the works of their hands. We have been looking into the past and rejoicing in our year of Jubilee at all that has been accomplished; let us turn for a moment to the present. We have entered upon a new session with

THE LARGEST ROLL OF MEMBERS

ever recorded—viz., 1,150. Of this number, 11 have been members for 40 years and upwards; 60 for 30 years and upwards; 110 for 25 years and upwards; 180 for 20 years and upwards; 302 for 15 years and upwards; and 552 for 10 years and upwards. Seven hundred and forty-eight of our present number joined before the subscription was raised in 1891, so that 402 have come in and remained since then. The Association has succeeded in retaining many of its best and most valued friends, who are ever ready to testify to the great advantages they have derived from its membership. On the other hand, there is a solid army of young men, many as yet untried, who are destined to take up the reins of government before long, and who have opportunities which, if wisely used, may be productive of lasting good to their own and future generations in raising the status of the profession and in the advancement of Architecture as a living art. There is one point in our comprehensive Scheme of Education which demands attention, and

CONTINUES TO DISAPPOINT US.

While the students in Division I. attend in very satisfactory numbers on the whole (and, in fact, the present accommodation is somewhat strained to properly provide for them), those in Division II. are comparatively few. What becomes of those who have passed through the first stage? It is very evident that a large proportion of them do not continue their studies and complete the course we wish them to follow. This is a problem that we have not succeeded in solving yet, and it suggests the advisability of making individual inquiries of those who have passed through Division I. to ascertain the causes which apparently lead them to abandon the higher and more advanced studies provided for them.

THE COMBINATION OF PRACTICAL WITH THEORETICAL INSTRUCTION

is also a subject which is exercising the minds many. At present, the facilities we offer our students in this direction are very limited. In the Handicraft Classes last session, the students were enabled to attend a course of manual training in masonry and leadwork, thanks to arrangements made by the Technical Education Board; and this session the board has kindly arranged for a series of workshop demonstrations in stone-working, to be given at the Regent-street Polytechnic. There appears to be a difference of opinion as to how far it is necessary or desirable that an architect should be able to put his own hand to the work of any trade. If it is an advantage that an architect should have actual manual experience, would it not be better that a student should be taught or apprenticed to one trade—say mason or carpenter—before he serves his articles? Such a course would seem to be the most convenient as well as the most practicable; later on he might with advantage gain considerable knowledge in other crafts, not necessarily by handling the materials and tools, but by observation either on works, in shops, or in craft classes; while later still the superintendence of works, either as clerk of works or otherwise, would be an experience of great practical value. After all, the years of a student are limited, and even if he should make the very best use of his opportunities, he cannot expect to accomplish very much in this department of his education. By far the most useful and appropriate thing for an architectural student is modelling, and it is a question whether this is not worth all the other crafts put together. The tendency of the times is, perhaps, to make too much of the manual work undertaken at the technical institutes. It is valuable as far as it goes, especially in the more scientific subjects; but it is a fallacy to suppose that it can in any degree supersede the training which an apprentice to his trade must and should acquire in the workshop, where the every-day practical problems have to be dealt with. It has been

resolved to commemorate the Jubilee of the Association by establishing a fund for

ACQUIRING NEW PREMISES,

suitable and adequate for the work carried on. For the last few years the cry has gone forth for increased and better accommodation; numerous efforts have been made to obtain premises, but hitherto without success; and seeing that our need is as great as ever, it has been determined to commemorate the Jubilee in the way mentioned. We have sought the advice and help of friends who have aided the Association generously in the past, and they have intimated their readiness to support us again, provided we are prepared with some definite scheme. We are now going forward in the matter with renewed energy and determination, and are hopeful that

THE WAY IS OPENING UP

for obtaining a site on which premises could be erected to provide studios and classrooms, library, reading-room, and offices, a common-room, and last, but not least, a meeting-room, so that under one roof we may combine all the essential accommodation for educational and social purposes. The provision of workshops might with advantage be arranged in a separate building more suitable for the purpose, if satisfactory arrangements could not be made with any of the public craft schools. This outline of a scheme may seem to indicate a large undertaking; but if carried out on the lines we have in view, there is little doubt but that it could be satisfactorily accomplished. Our desire is to formulate a definite scheme that is practicable and attainable within reasonable limits and a reasonable period. The question of establishing a

MUNICIPAL SCHOOL OF ARCHITECTURE

has been talked of, and may yet come; but such an institution could never do the work that the Association undertakes, neither could the Association open its doors to outsiders and accept grants or subsidies from county councils or other public bodies without sacrificing its freedom and ceasing to fulfil the objects for which it exists. It is an advantage that cannot be too strongly urged that the architectural student should be trained in an architectural atmosphere, that he should have every opportunity of associating with kindred spirits and forming lasting friendships with them. The true spirit of comradeship will be best promoted by such intercourse, and the higher claims of art will be more easily attained. Let us go forward, therefore, with renewed energy to the duties and studies of another year, remembering that the opportunities, the advantages, and the privileges which are now the inheritance of our students have been obtained by the cordial co-operation, the self-sacrifice, the patient toil, and the brotherly love of men who for fifty years have joined hands in promoting the advancement of architectural education and upholding the first principles and honoured traditions of the Architectural Association.

Mr. COLE A. ADAMS, past-president, proposed a vote of thanks to the President for his comprehensive and interesting address, remarking that he was not sure that it was well for the architectural student to devote much time to manual crafts and technical work. Few of the great masters of the immediate past had taken up these pursuits in detail; and imagination stood, after all, as the leading attribute of the architect. All felt the necessity for new premises, and with a determined effort and enthusiasm this aim would be realised.

Mr. BERESFORD PITE, in seconding the motion, said the President's admirable bird's-eye view of the policy and progress of the Association had shown that there would have been no examination scheme and no education movement had it not been for the initiative of their humble little body. They had not been hampered by Royal Charters, but had periodically revised their rules, and adapted themselves to new requirements. They had always had a practical aim, but had never lost sight of their high ideal. He urged on students the importance of using their eyes, and held that the time spent in searching over and examining files of architectural journals was never ill-spent; nor should they be afraid to use their indiarubber over and over again in the preparation of design. He was not sure but that the falling off in class and lecture attendance after students had reached a certain point was not a healthy sign, so far as the future of the profession was concerned.

Mr. OWEN FLEMING, in supporting the motion, inquired whether they were working on right lines if, after fifty years of such advantages of architectural education as the poor Greeks and 13th-century men never dreamed of, they still continued to design the hideous railway stations and street buildings to be seen rising on every side in our great cities? What was wanted was more education and less instruction, and he would urge the importance of manual training as a preparation for the architect.

The vote of thanks, having been carried by acclamation, was briefly acknowledged by the President.

NOTES ON SURVEYING AND LEVELLING.—II.*

By WALTER TESTER.

SECTIONING THE GROUND.

THE accompanying sections, Figs. Nos. 4, 5, 6, 7, and 8, will give an idea of the irregular nature of the ground; they are taken along the lines shown on the plan (Fig. No. 1). The manner in which they are taken will now be described. It will be supposed that the surveyor's time is limited, and that it is impossible for him at present to take a complete set of sections all over the ground, and that he must obtain as much information as to levels as he possibly can in the time at his disposal. On the 208-33 scale Ordnance map there is a bench-mark, 19.6, on the wall near point L, and also another in Victoria-road 48.4 (see plan, Fig. No. 1). The surveyor starts by taking a reading on the bench-mark 19.6, and works with as few settings as possible to the bench-mark 48.4 in the direction Q P O N W G F, leaving a peg firmly driven into the ground, or a permanent mark on any fixed objects he meets with at each changing point. When he has reached the bench-mark 48.4 and taken a reading on it, he can fill in the level of his first bench-mark—viz., 19.6—and reduce the whole series. The second bench-mark should work out to 48.4, if his levels are correct. If there is any serious difference, he can easily run over the ground again, having retained his points. His levels will, in this way, be reduced to Ordnance Datum, which is an advantage, as he can compare any other levels given on the Ordnance map with his own.

In the manner just described, he should work from the bench-mark 48.4 down E. erton-street, and along the river-front back to his first starting-point, leaving permanent marks along the route, and checking his levels as before. In this way a series of bench-marks will be established for future use, and from these others can be fixed in any portion of the site. Where they are pegs driven into the ground, they should be made quite firm, and, if possible, protected; and a list should be made with a description of their position, and giving the reduced level above Ordnance Datum. If one of these backsight pegs has not been used for some time, and it is proposed to start a series of sections off it, the level should be checked from some more permanent bench-mark, such as a fixed mark on a building or a gatepost. In taking a set of levels of the description we are dealing with a good method is always to take the back sight off one of these fixed bench-marks at every change in the position of the level, using only two columns for readings in the level book, the back sight off a bench-mark being entered in the left-hand column, and all other readings from this setting in the second column. The advantage of this method is that the surveyor is sure of the reduced level of his bench-marks, and if he checks his back sight by taking a second look after he has taken all his readings from this setting, and, just previous to changing his position, he can satisfy himself as to the general accuracy of his work, as there is only the chance of an odd reading being wrong. It will be as well at this place to say a few words about the method of reducing levels: Some surveyors reduce each level in succession from the previous one by finding the difference between the two readings, and adding or deducting this difference to or from the reduced level of the preceding point, according as the ground rises or falls. A much simpler way is to add together the reduced level and the reading of the back-sight point for a constant for all readings taken from this setting; then, all that is necessary is to deduct each of the readings from this constant for the corresponding reduced level. This simply means

that the distance between the datum and the line of collimation is constant for one setting, and, as the reading or distance from the line of collimation to the ground varies at different points, so the reduced level or distance from the ground to the datum varies to a corresponding extent, but inversely.

Let us take an example:—

B.S.		Reduced Levels.
2.30		34.50
...	3.40	33.40
...	4.50	32.30
...	1.20	35.60
...	5.60	31.20
...	6.30	30.50
...	7.40	29.40
...	12.00	24.80
...	18.50	23.30
	53.90	240.50

Constant.
34.50 + 2.30 = 36.80
Deduct 3.40 = 33.40
" 4.50 = 32.30
" 1.20 = 35.60, &c.

The results may be checked by adding up all the readings and reduced levels (excepting those for the bench mark), and this should total up to the same as the result of multiplying the constant by the number of readings:—

240.50
53.90
294.40

Constant.
36.80 × 8 = 294.40.

So far as the present sections are concerned, it has already been explained how the series of parallel lines at the river front can be set out; also the survey lines KJ and CF can be used for sections. For the purpose of checking the chaining of the series of parallel sections, a point, Y, should be fixed at the top of the cliff near the house on the central section of the series (Fig. No. 1), and a line set out square off the

section line and parallel to LM and KB. All these sections should measure the same length between this line and KB. It will be best to take several of these sections together, with one setting of the level as far as the bottom of the cliff, and then moving the level to a higher position to take the central portion of each, and, finally, moving the level to the top of the cliff, to take the remaining lengths. One or two of these sections should be produced, as shown on the plan, Fig. No. 1, and one should be taken on the line WZ, as this is the roughest part of the estate. The theodolite will be found very useful for producing these lines, as, for instance suppose a high ridge crosses one of the lines, with a sudden drop in the ground behind the ridge. The surveyor can place the theodolite on the ridge at a point in the line and produce it by turning over the telescope, as previously explained.

In addition to the sections, the surveyor should take as many odd levels as he can at any fixed points on the plan, such as the junctions of roads, corners of buildings, &c., and for this purpose the bench marks he has fixed will be very useful. Sufficient has now been said to explain the preliminary surveying and levelling operations; but there must necessarily be a considerable amount of work of this description yet to be done, as, for instance, on the athletic grounds which is to be placed on the rough ground in the neighbourhood of the line WZ (Fig. 1), and these matters will be dealt with in subsequent articles.

PLOTTING THE SURVEY.

It will be as well to make a few remarks as to the method of plotting the main lines of the survey. Let us suppose that it is to be put down to the scale 40ft. to the inch. It will be found that the angles cannot be set out sufficiently accurately with a protractor, unless it is a very large one indeed, the lines requiring to be produced after the angles are marked out. The most accurate and the proper way is to calculate

diagonal dimensions for the angles. Let us take the main figure of the survey C F J K, see sketch Fig. No. 9, neglecting for the time the triangle F G H. The surveyor wishes to plot the line K J in its true position in relation to the line K C. The angle J K C being $88^{\circ} 50'$, and length

FIG. 9.

of K J = 1,139ft. 6in., length of C K = 1,018ft. He has now the two sides and contained angle of a triangle, and he wishes to calculate the third side in the direction J C. The formula is, from Molesworth's "Pocket-book":—

$J C = \sqrt{C K^2 + K J^2 - 2 C K \times K J \times \cos. \text{angle } K}$, which means a lot of calculation, and can be simplified by taking 1,000ft. along each of the lines C K and K J, giving points near the ends.

$\cos. 88^{\circ} 50'$ from the Tables = $\cdot 0203608$, and substituting the figures in the formula—

$$\begin{aligned} J C &= \sqrt{1,000,000 + 1,000,000 - 2 \times 1,000 \times 1,000 \times \cdot 0203608} \\ &= \sqrt{2,000,000 - 2,000,000 \times \cdot 0203608} \\ &= \sqrt{200,000 - 40721 \cdot 6} \\ &= \sqrt{159278 \cdot 4} = 1399 \cdot 74 = 1,399\text{ft. } 9\text{in.} \end{aligned}$$

The same method can be used for the line C F, the angle K C F being $90^{\circ} 4'$, and taking 1,000ft. along each line, as before, we have—

$$\begin{aligned} &\sqrt{2,000,000 - 2,000,000 \times \cos. 90^{\circ} 4'} \\ \text{Now, } 90^{\circ} 4' \text{ being more than a right angle, we} \\ \text{take the cos. of } 180^{\circ} - 90^{\circ} 4' = 89^{\circ} 56' = \cdot 0011636, \\ \text{and change the sign—} \\ &\sqrt{2,000,000 - 2,000,000 \times - \cdot 0011636} \\ &= \sqrt{2,000,000 + 2327 \cdot 2} \\ &= \sqrt{2,002,327 \cdot 2} = 1415 \cdot 03 = 1,415\text{ft. } \frac{1}{2}\text{in.} \end{aligned}$$

For calculations of this nature the table of decimal equivalents of the division of a foot in Molesworth's "Pocket-book" will be found exceedingly useful, and for the natural sines, cosines, &c., "Chambers's Mathematical Tables" may be used. If the surveyor understands the use of logs., he can use the tables for same in the latter book, and it will reduce the length of his calculations. In the two examples given above the figures are so simple that it will scarcely be worth while using logs., except perhaps for taking the square roots at the end. For example:—

Number.	Log.
195 9 2 7 8	= 2920 7 8 8
195 9 2 1 7 8 4	= 2920 9 6 1 5 8

Dividing by 2 to extract the square root = $3 \cdot 146048079$.

Log.	Number.
146048079	= 13997
1460350	= 13997
.... 130	
124	= 4
67	
62	= 2
59	= 2
	13997 4 2 2
8 146048079	= 1399 7422

The above results may be checked by the method given in Molesworth's Pocket Book for plotting angles without a protractor, which is also simpler. This rule is—"Strike out a portion of a circle with radius 100, and lay off a chord equal 2 sin. of half the angle required."

Applying this to the examples, and using 1000 radius instead of 100, we have—

$$\begin{aligned} \text{Angle, } 88^{\circ} 50' \\ \frac{1}{2} \text{ sine, } 44 \text{ } 25 &= \cdot 6998711 \\ 1000 \times \cdot 6998711 \times 2 &= 1399 \cdot 7422 \\ \text{And for the angle, } 90^{\circ} 4' \\ \frac{1}{2} \text{ sine, } 45 \text{ } 2 &= \cdot 7075180 \\ 1000 \times \cdot 7075180 \times 2 &= 1415 \cdot 0360 \end{aligned}$$

The lines K J and C F can now be plotted down in their correct position in relation to K C, using a length of 1,000ft. along each line by means of the calculated dimensions; they can then be produced to the proper lengths, and J F should now work in exactly.

The line in the direction H F not being run through to meet C F, will have to be calculated, also the distance from G along G F, where it would cut.

Taking this triangle and calling it G H F (see sketch, Fig. No. 10), the angles at G and H are measured outside the triangle, and if we deduct

FIG. 10.

each of these from 180° , we shall have the angles inside. The angle at F will be the balance to make up 180° inside the triangle the length G H was measured. Therefore we have the three angles and one side of a triangle. And from the formulæ—

$$H F = \frac{G H \times \sin. \text{angle } G}{\sin. \text{angle } F}$$

$$\text{and—} \quad G F = \frac{G H \times \sin. \text{angle } H}{\sin. \text{angle } F}$$

These two lines being calculated, the main figure of the survey, C F J K, can be plotted, and there should be no difficulty in filling in the lines of the subsidiary figure A B C D E (Fig. No. 1), or any of the internal lines used for filling up the walks, drives, &c. The latter may be put in with the help of a protractor. The following method may be useful for plotting a series of lines similar to the ones used for the drives and walks.

Suppose there are several lines running one from another at various angles which are

FIG. 11.

measured. See sketch, Fig. No. 11. (These are not the lines of the survey.) The line D E can be checked in its relation to the line A B by calculating the angle which they would make with each other if produced to meet. Suppose the lines E D and D C are produced to meet A B produced at F and G, then, taking the triangle B C G—

$$\begin{aligned} \text{Angle } C B G &= 180 - 170 = 10^{\circ} \\ \text{BCG} &= 180 - 160 = 20^{\circ} \\ \text{Therefore angle } B G C &= 150 \end{aligned}$$

$$\text{The balance of } \dots 180$$

In the same way, in the triangle D G F—

$$\begin{aligned} \text{Angle } D G F &= 180 - 150 = 30^{\circ} \\ \text{G D F} &= 180 - 150 = 30^{\circ} \\ \text{Therefore } G F D &= 120 \end{aligned}$$

$$\text{The balance of } \dots 180$$

If the lines have all been tied together with angles and measurements in the manner described, there should be no difficulty in filling up the details of the survey.

"BUILDING NEWS" DESIGNING CLUB: AWARD OF PRIZES, 1896-7.

THE successes of the past twenty years augur well for the continued prosperity of our Designing Club, which has been conducted with so much advantage to those who have availed themselves of its competitions. The contests are open to all, without fee of any kind. We now present the prizes offered for the best work of the past session, and reopen the competitions for the forthcoming season. In these days of the survival of the fittest, as the saying goes, there can be no doubt that the architectural student must let no opportunity pass without endeavouring to make the most of it to further his knowledge and gain experience. By testing his own capabilities in planning and design with the attempts of others, in the manner supplied by our Designing Club, must undoubtedly tend to strengthen his position besides affording him an opportunity of securing publicity for his work, provided it reaches a given standard of merit. The designs are all brought under review, the principal ones obtain mention, and the best are illustrated. The awards are arrived at by the points secured by the students' successes throughout the year. For the last session they rank in the following order:—"Nap," "Pickles," and "St. Leonard." Hon. mention is accorded to "Nut" and to "The Dingo." We therefore award the prizes as follows:—

"Nap" (first prize), £10 10s., Mr. Fred. W. C. Gregory, 19, Forman's Buildings, Goldsmith-place, Nottingham.

"Pickles" (second prize), £5 5s., Mr. C. J. F. Palmer, 48, Northwood-road, Archway, Highgate, N.

"St. Leonard" (third prize), £3 3s., Mr. W. B. Y. Draper, De Grey House, St. Leonard's-place, York.

LIST OF SUBJECTS AND RECORD OF SCORES.

A.—Country Cottages.—"Pickles," 1; "St. Leonard," 2; "Moss," 3; "Potluck," 4; "The Dingo," 5.

B.—Village Church.—"St. Leonard," 1; "Pickles," 2; "Nut," 3; "The Dingo," 4; "Cheese," 5.

C.—Small Village School.—"Nap," 1; "Pickles," 2; "St. Leonard," 3; "The Dingo," 4; "Tyke," 5.

D.—Technical Institute.—"Nap," 1; "Pickles," 2; "The Dingo," 3; "Nut," 4; "Manxman," 5.

E.—Small Country House.—"Alfo," 1; "Nap," 2; "Idristwyn," 3; "Pickles," 4; "The Dingo," 5.

F.—County District Council Hall.—"The Dingo," 1; "Nap," 2; "Nut," 3; "Pickles," 4; "Pantile," 5.

G.—Stable Buildings.—"Nut," 1; "Pickles," 2; "Nap," 3; "Dache," 4; "Pantile," 5.

H.—Tea and Coffee Restaurant for Suburbs.—"Nap," 1; "Pantile," 2; "Pickles," 3; "Tyke," 4; "Orb," 5.

RULES OF COMPETITION FOR SESSION 1897-8.

1. Drawings to be sent within 28 days after the publication of the particulars of each subject.

2. One or more subjects will be given every month, from which a competitor may choose.

3. The drawings to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 22in. by 14in., with no washes or tinting in colour whatever; outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts to be shown in ruled "hatching," or blocked in. The scaled to be used will be given with each subject.

4. Drawings to be forwarded, unmounted, by post, care being taken to roll the short way of the drawing, as packages over 18in. long are not transmissible through the book post.

5. On entering the Class (which may be done at any time) each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing as a guarantee of good faith, the *nom de plume* the author intends to adopt being boldly marked on the front of each separate drawing. The motto,

once adopted, to be adhered to throughout the session.

6. Prizes of £10 10s., £5 5s., and £3 3s. will be awarded to the best series of designs. Our decision to be final.

7. Before awarding the prizes any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.

8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.

9. A critical notice of the designs sent in of each series will be given in an early issue following the receipt of the drawings.

FIRST LIST OF SUBJECTS, 1897-8.

A.—A Suburban Dwelling-house, for a City gentleman, to cost £2,000. Economy of plan on a limited site are points of leading importance. The frontages are at the corner of two roads, facing south and west. The main road side of the plot measures 50ft., and has a return of 150ft. The elevation must set back 18ft. from the boundary fence on the main road side. A large dining-room or living-room is to take the preference over the drawing-room or parlour. A third sitting-room, not less than 12ft. square, is to be provided for a study or breakfast-room. That need not necessarily be on the ground-floor. A mezzanine arrangement is suggested. There must be six bedrooms in all: two of these may be attics. Bath-room essential, and two w.c.'s, besides kitchen and offices. There may be a small cellar. The entrance must be roomy but not wasteful, and the stairs not less than 3ft. 3in. wide. Materials brick, with stone dressings sparingly used. Roofs covered with tiles, style optional. Size of rooms to be governed by the money expenditure. Drawings required: Three plans, two elevations, and a section scale 8ft. to the inch. Plans may be 16ft. to inch; sketch view necessary.

BUILDING TRADES' CONFERENCE ON TECHNICAL EDUCATION.

A MEETING of representatives of the building trades, to consider the best way in which the Craft School could supply the needs of the London building trades with regard to technical education, was held on Wednesday evening in the workroom of the school in Globe-road, E. The chair was occupied by Mr. Llewellyn Smith (chairman of the school and Deputy-Comptroller of the Board of Trade), and among those present were Sir Philip Magnus, Mr. Holloway, Dr. Garnett (secretary of the Technical Education Board, L.C.C.), Mr. Selby-Bigge, Mr. W. A. Lethaby (Art Inspector to the Technical Board), Mr. Oldman (secretary National Association for Promotion of Technical and Secondary Education), Mr. Dent (Labour Commissioner), besides representatives of building trade societies. The chairman observed that, whatever might be the feeling with regard to the changes that had come over the country with regard to apprentices, there would be no contention as to the need of centres where workmen could have an opportunity of perfecting themselves in the various branches of their trades. The object of the classes for the building trades was for the training of workmen, and not for the amateur, for they were of opinion the two could not be successfully mixed up together. A very considerable number of workmen in the district already took advantage of them, and the object of the conference that evening was to obtain suggestions as to the best means of making the classes useful and more widely known. All the suggestions made would be carefully considered by the committee, with the desire, so far as practicable, of carrying them out, so as to make the school more useful to the centre of the great building trade. Mr. George Dew said the time had come when, as trade unionists, it was their duty to get lads to go into the classes. It was only by these the younger ones could obtain knowledge. The building trade had unavoidably changed, and the title of "master craftsmen" no longer belonged to their employers. Mr. Holloway, as an employer of the building trades, said he had considerable sympathy with institutions of that character. He fully realised there was great room for improvement in the skill of their mechanics. He deplored the fact that the system of apprenticeship had fallen out of prac-

tice; but his firm kept it up, for the apprentices turned out the best mechanics. As an encouragement to lads in his firm, on the completion of their apprenticeship, if they had behaved themselves during that term, they received £5 to set themselves up with a set of tools. Such an encouragement was an inducement to lads to take up an apprenticeship; and institutions like that school ought never to take the place of apprenticeship, but simply to augment it. He concluded by suggesting that the foremen should be invited to visit the classes. A discussion followed.

CHIPS.

Messrs. Hans Price and Wooler, of Westonsuper-Mare, have been instructed by a committee of the urban district council for that town to prepare plans for dwellings, shops, and alterations to the Market House at a cost not to exceed £3,500.

The conversazione of the Architectural Association is being held later in the session this year than usual—namely, on Nov. 26—the reason being to allow time for the preparation of a topical play which it is intended to produce on the occasion.

Mr. Ernest Veall, of Norwich, in the office of the Norfolk County Council, has been appointed district road surveyor of the East Elloe (Lincolnshire) Rural District Council, at a salary of £62 10s.

The committee of the Harrogate School of Art have purchased a site in the centre of the town whereon to erect the new Technical Institute and School of Art. The total cost of the building is estimated at £6,000.

The Metropolitan Asylums Board made an important appointment at their meeting held on Saturday last—that of architect for their new chief offices which are to be erected on the Thames Embankment, upon a site recently purchased from the City Corporation. Acting on the recommendation of a committee, the board appointed Mr. Edwin T. Hall, F.R.I.B.A., of Moorgate-street, who designed the Park Fever Hospital at Hither Green, Lewisham, opened a month since.

The new church of St. Gabriel's, Willesden Green, was consecrated on Thursday in last week by the Bishop of London. It is built in Walm-lane, and consists of a chancel, Lady-chapel, and chantry, three bays of the nave and aisle. It is in style Early Decorated. The church seats 600 in the present condition, but it will accommodate 1,000 when completed. The building was designed by Mr. P. Philip Day, and built by Mr. J. Bentley. The contract for building the portion of the church now erected amounts to £7,000.

The Burlington Hotel, which is about to be built at Swanage, on the site overlooking Swanage Bay, on the road to Studland, at a cost at present of some £6,000, to be increased when the hotel is fully completed to some £16,000 or £20,000, has been granted a full license by the Dorset county magistrates.

A new drill-hall for the members of the Shirley Company of the 1st Hants Artillery Volunteers has been erected in Shirley-road, and was opened on Thursday in last week. The drill-hall has been built from plans prepared by Lieut. J. H. Blizard, architect, of Southampton, and is of corrugated iron, the interior being lined with matchboarding. In front of the hall is a parade-ground extending to 105ft., with a width of 40ft., there being a depth of 7in. of gravel, the inside of the hall having a floor of the same material to a like depth. There is a skylight, with louvres for ventilation. The brick foundations of the building were laid by Mr. T. J. Jukes, of Freemantle, who also carried out the internal and external fittings; while the hall itself was erected by Messrs. Powell and Co., of Westminster.

The fund for the provision of a public park and recreation-ground for Widnes and the extension of the West Bank Promenade, in commemoration of the Queen's Diamond Jubilee, is making satisfactory progress. The amount required is £14,000, and towards that sum about £11,500 has already been subscribed.

The Earl of Jersey and Colonel Boughey, Commissioners under the Light Railway Acts, held an inquiry at Derby on Monday into a proposed electric railway between Derby and Ashbourne. The length of the line would be about thirteen miles, and would run alongside the highway. The commissioners expressed their approval of the proposals, which, it was stated, would involve an outlay of £70,000.

Mr. Francis Cranmer Penrose, F.R.S., Fellow and late President of the Royal Institute of British Architects, having resigned his position as architect and surveyor to St. Paul's Cathedral, after holding the office for a period of thirty-four years, the Dean and Chapter of the Cathedral have appointed Mr. Somers Clarke, F.S.A., of Dean's-yard, Westminster, to succeed him.

Building Intelligence.

BIRMINGHAM.—The city council received on Tuesday a report from the lunatic asylums committee stating that the formal approval of the Home Secretary has been obtained to the conveyance of the Holly Moor Farm land, and the purchase will be shortly completed. The committee had had under consideration the next step towards the erection of the asylum, namely, the question of the appointment of architects. The Commissioners in Lunacy, who have to examine and approve the plans before a building contract can be made, strongly recommended the appointment of architects who had had previous experience in the erection of lunatic asylums of a similar class, and they did not speak favourably of the usual results of competitive plans; besides which, experienced architects now declined to prepare plans for such a competition unless they each received payment for their labour, and the referee also required a handsome fee for his services; the cost of a competition might, therefore, approach £1,000. The committee also believed that there was a general feeling in the council against going outside Birmingham for professional assistance, which could be equally well obtained within the city. The building will be an extensive one, of a very special kind, not situated in the city, and the purpose will not be so much to provide an ornament to the neighbourhood as to erect a well-proportioned comparatively plain building, with every convenience and advantage which experience can suggest for the care and comfort of the patients. After giving the matter careful consideration, the committee were satisfied that the expense and labour of a competition would far outweigh its advantage; and they proposed, with the approval of the council, to offer the appointment to Messrs. Martin and Chamberlain, if fair terms could be arranged. This firm were the architects of the Rubery Hill Asylum, which had proved to be a satisfactory building of its class, and Mr. William Martin was engaged upon the plans of the Winson Green Asylum, and had carried out all the subsequent enlargements and alterations. He was also called in to reconstruct and enlarge the Glamorganshire Asylum at Bridgend, and to improve and extend the new asylum at Carmarthen. This recommendation and report led to a long discussion; but eventually an amendment referring the matter back to the committee with instructions to obtain plans in a limited competition was carried by the narrow majority of 32 votes to 30.

DOUGLAS, ISLE OF MAN.—It will be remembered in the recent open competition for a new town hall, the design of Mr. Arthur Ardron, F.R.I.B.A., of Westminster, London, was selected, and tenders obtained. The tender of Messrs. Gradwell, contractors, of Barrow-in-Furness, at £10,368, has now been accepted. Three distinct groups are provided: municipal buildings, free library, and fire-station. The first-named is placed at the corner of Ridgeway-street and John-street, and the free library occupies the remainder of the Ridgeway-street frontage, and has also a frontage to Church-street. The fire-station is placed at the corner of John-street and Church-street. The principal entrance to the public offices is from John-street, through a vestibule. The town clerk's department is placed next Ridgeway-street, and the borough surveyor's next John-street; the principal staircase of Portland stone with wrought-iron balustrading, together with lavatories for the staff, are arranged centrally for each department. On the first floor is the council chamber, approached from the main corridor, with three committee rooms and waiting rooms, as well as lavatory and cloak-room accommodation. The council chamber, which is divided into three bays by pilasters, has a panelled wood dado, and has an elliptical arched ceiling, ribbed and treated in ornamental plasterwork. At one end is a small gallery for the use of the public, approached by a separate entrance and staircase. On the second floor, over the committee rooms, are the caretaker's quarters, also with its own entrance. In the basement are provided heating chambers, strong rooms, coal stores, &c. The free library will be entered from Ridgeway-street, and has the news-room and lending department on the ground floor. The reference room is on the first floor, over the lending library, with librarian's private room, &c. Galleries are provided in the lending and reference rooms for the storage of books, while further storage room is

provided in the basement, with lift communication. The fire-station contains engine-room, opening into Church-street, with folding doors, with assembly room above. A hose-room, with tower for drying purposes, is also provided. The style of the building, which was illustrated in our issue of Feb. 12, 1897, is Italian Renaissance, freely treated. The walls facing Ridgeway-street and John-street will be built in local stone, with Monk's Park Bath stone dressings; while the elevation next Church-street will be carried out in brick. The roof will be covered with Broseley tiles. The building throughout will be heated on the low-pressure system by means of ventilating radiators and heating pipes. The buildings will be commenced at once, and it is intended to have them completed in 18 months from the present time.

LEICESTER.—The Bishop of London opened last week the new art and technical schools which have been erected by the Leicester Corporation at a cost, for site and buildings, of nearly £40,000. Hitherto the art and technical schools in the town have been distinct institutions, but it was decided to incorporate them in one building. The corporation secured for £8,000 a new central site in the Newark, near Leicester Castle. The site extends to nearly three-quarters of an acre, and the main frontage is nearly 220ft. in length, with an elevation of four stories. The structure is of red brick, with Portland stone dressings, and has been designed by Messrs. Everard and Pick, architects, Leicester. Two of the floors are devoted to technical instruction in hosiery and boot and shoe manufacture, with a variety of all kinds of old and new machinery, showing the development of the processes of manufacture, engineering, plumbing, dyeing, painting, &c. The two upper floors, which comprise the school of arts, have been fitted up at a heavy outlay, and the local efforts have been seconded by the authorities of South Kensington, who have given classes and lent a wide variety of objects of art for the benefit of the students. The art school has also been enriched by the Art Departments of France, who have provided casts and other art objects from the Musée du Trocadero, Paris. The large casts of screens, figures, stalls, &c., were brought to Leicester in sections, and rebuilt in the school by Italian artists. A portion of the roof of the building is flat, and on this a conservatory has been erected for plant-life studies. We illustrated the buildings by a double-page perspective and full page of plans in our issue of May 29, 1896. Messrs. T. and H. Hertel were the contractors. The late Mr. John Lovday was the first clerk of works, and since his death Mr. C. S. George has held that post.

LISKEARD.—The vicar and churchwarden of Liskeard have received the written judgment of the Chancellor of Truro (Mr. R. M. Paul) on their application for a faculty to take down the existing tower of the parish church and erect a new tower in harmony with the church. The petition was heard by the Chancellor and his assessor (Mr. C. E. Ponting, F.S.A.) in open Court at Liskeard Guildhall on the 23rd ult. In his judgment, the Chancellor mentions that Mr. Ponting "made a thorough examination of the tower and the foundations, the petitioners having most courteously permitted pits to be sunk on two sides of the tower. It was found that, although the rock formation exists at a depth of 10ft. from the surface, the foundations are only carried down 4½ft., without any proper projection beyond the face of the wall, and are composed of small rubble stones laid dry, as is so often the case with Norman foundations. The result is a serious settlement of these foundations and cracks in the superstructure, and this movement has now undoubtedly reached a critical stage." The Chancellor adds that he is advised by Mr. Ponting that, notwithstanding the defects enumerated, the tower can be restored, that it "can be underpinned and repaired without the addition of buttresses" (as recommended by Mr. Fellowes Pryne), and put in sounder condition than when first built. Churches in an equally dangerous condition are enumerated which have been secured under the supervision of Mr. Ponting, who has expressed his willingness to gratuitously give to the petitioners written directions as to the methods to be adopted, and, if required, to send them a builder to carry out the work. In giving his decision, the Chancellor says the Court is bound to consider future as well as present parishioners, and "in a diocese where Norman work is comparatively rare, no effort should be

spared to preserve every link that connects the present age with the far-distant past." Mr. Paul, therefore, rejects the prayer of the petition so far as it involves the demolition of the existing tower and the erection of the proposed new tower; but, if the tower be restored, a vestry-room may be erected on the south side, in accordance with Mr. Sansom's plan. If it will meet the wishes of the petitioners, the Chancellor adds that he would be prepared to sanction the necessary work recommended by Mr. Ponting for the preservation of the existing tower, and the erection of the proposed new tower (with such modifications as the altered circumstances render necessary) at the N.E. or S.E. corner of the church. A local journal, which makes a violent attack on "the solicitor from Truro" for his judgment, mentions that the fee charged by Mr. Ponting for his services is 27 guineas, which, with the expenses of the Court, amounting to £8 2s. 4d., has to be paid by the parishioners of Liskeard, in addition to the petitioners' own legal expenses.

MINORIES.—A new City police-station at the corner of the Minories and Goodman's-yard was occupied for the first time last week. It is a plain building of red brickwork four stories in height, with a domical turret carried one floor higher at the angle of the two streets. On the ground floor are the charge-room, the inspector's room, and the muster-room, and opening out of this latter is an apartment for the use of the detectives. Seven cells are provided, cased with white glazed brick, and lighted directly from the inner courtyard, instead of, as is usually the case, deriving their light from a passage. In the basement are the mess-room and a large kitchen, together with the necessary offices and the coat and helmet room. The ground floor contains, in addition to the official rooms mentioned above, a reading-room and a large recreation-room. It is in the men's sleeping-rooms that the greatest change has been made. Instead of the usual dormitories, every man at the Minories will have his own cubicle, a little apartment 9ft. by 6ft., each of which has its own window, and a cupboard in which clothes can be kept. There are three floors of these cubicles, and on each landing there is lavatory accommodation, with a bathroom. In all some sixty-five constables and sergeants can be accommodated at this station, in addition to a housekeeper. The building has been constructed from plans prepared by Mr. A. Murray, the City surveyor, and the work has been carried out under the personal superintendence of Mr. T. R. W. Mossman, of the City surveyor's office.

NEWCASTLE-ON-TYNE.—At a meeting of the Stewards of the Freemen of Newcastle on Tuesday, it was decided by an overwhelming majority to grant a site for the new infirmary on the Leazes, to which attention was drawn by the deputation of the governors of the infirmary who waited upon the Freemen the previous Wednesday. It was also resolved that the site should be an absolute gift. The opinion was general that such a noble offer as that of Mr. Hall's to build a hospital at an estimated cost of £100,000 should be met in a magnanimous spirit.

THORNHILL, DUMFRIES.—A new church is in course of erection for the United Presbyterian congregation in Thornhill, the memorial stone of which was laid on Saturday by Mr. Hugh Stevens, Glasgow. It is being erected on the site of the former church, in West Morton-street. The style is Gothic, of the Decorated period, and the principal feature of the main gable is a four-light window, with tracery head. The gallery staircase is placed in a square tower which rises at the side of the church behind the porch, and is carried to a height of 60ft., being finished with a low tiled spire. Internally the church will be roofed in a single span, with moulded timber main couples carrying a semi-octagonal ceiling. The principal timbers will be dressed and exposed; the ceiling between these is finished in plaster. There will be a gallery at the end only, facing the pulpit. The church is being built of red stone from Gate-lawbridge quarries. The woodwork finishings and seating throughout will be of pitch-pine; glazing in lightly-tinted antique glass; gasfittings in wrought iron. The total number of sittings provided for is 360. There are also a hall for 90 persons, vestry, lavatory, heating-chamber, &c. The total cost will be about £1,900. The architect is Mr. John B. Wilson, A.R.I.B.A. and I.A., Glasgow. The following are the contractors for the various works:—Mason, Mr. James Cook; joiner, Mr. W. McCane; plumber

and heating, Messrs. P. Drummond and Son; plasterers, Messrs. Waugh and Nish; slater, Mr. J. Corson—all of Thornhill; painters and glaziers, Messrs. A. and H. Gilchrist, Kilmarnock.

TRURO.—The High School for Girls in Fal-mouth-road was formally opened last week by the Bishop of Truro. In general appearance the school is of Elizabethan character, having at the N.E. corner a battlemented tower. The windows have mullions and transoms, which, like all the dressings, are of Cornish Mabe grey granite. The walling is of squared Plymouth limestone. The endeavour has been to produce a building which should be of good proportions, outline, and massive, and funds being very limited, there is little ornament except some panels sculptured in granite, from full-sized models by Mr. Martyn, of Cheltenham, under the architect's supervision. The main entrance leads into a square hall, from which the central hall of the school on the principal floor is reached by a staircase of teak and pitch-pine. This hall measures 48ft. by 26ft., and, as adjoining classrooms can be added to it at pleasure, it affords floor space for seating about 400 people at time of examination. It is lighted wholly from the two ends by mullioned and transomed windows. It has an open-timbered roof of simple design (adapted for the application of swings and gymnastic fittings). A battlemented tower masks the lavatories and dressing-rooms, and forms the access to the playing field. The tower contains on the main floor a waiting-room and a room for the head mistress; at a higher level an assistant-mistresses' room, and in its upper part accommodation for a caretaker. On the lower floor are reached from the entrance-hall a dining-room and kitchen, teachers' room, and complete lavatories and dressing-rooms for the girls. Under the central hall the slope of the site has afforded space for the storage of chairs when not in use. The warming commences by the provision of a warm-air stove of the Heim-Gundry kind; there is also a system of hot-water warming, and fires in the rooms. The total cost, including the excellent site, is about £4,100. The work has been carried out by Mr. John Collier, builder, of Truro. The architect is Mr. E. R. Robson, F.S.A., of Westminster. Under Mr. Robson's direction, the progress of the building operation has been supervised by Mr. Silvanus Trevail, F.R.I.B.A., architect, of Truro.

CHIPS.

A United Methodist Free chapel at Dunham Hill, on the main road from Chester to Warrington, was opened on Wednesday in last week. Mr. G. C. Taylor was the architect.

The town council of Halifax have instructed the borough engineer to prepare detailed plans for a hospital for smallpox, at Harewood Well Moor, at an estimated cost of £16,000, including land.

The new electric-lighting station at Bradford was formally opened on Friday by the mayor. The building is situated in Valley-road, and the plant and premises have cost close on £40,000, whilst the capacity of production is 12,000 8c.p. lamps. The new machinery consists of two six hundred imperial horse-power engines, two six hundred electrical horse-power dynamos, feed pumps, two boilers, condensing plant, switchboard, &c. Mr. J. L. Morley, Bradford, has supplied the condensing plant, which includes air and circulating pumps. The new machinery has cost £10,325.

The Earl of Jersey and Colonel Boughey, the Light Railway Commissioners, attended at Gooles, on Saturday, to hold an inquiry into the application of the promoters of the Gooles and Marshland Light Railway, for an order granting them permission to construct such a light railway. The total proposed mileage is 1½ miles, the district to be served extending from the Trent to the Ouse.

The scheme of water supply promoted by the local authority of Portland has received the approval of the Local Government Board. It will supply the Government departments, Admiralty, prison, and the inhabitants. The source of the supply is situated in the chalk hills at Upwey, between Weymouth and Dorchester, and the water will be conveyed by pipes to Portland. The work will be commenced immediately.

The new publishing premises of Messrs. Macmillan and Co. were opened on Tuesday. The new building, which extends from St. Martin's-street to Whitcomb-street, is of Portland stone, of Classical design, has a frontage of 106ft. in Whitcomb-street, 99ft. in St. Martin's-street, and 24ft. in Blue Cross-street. Mr. John Cash, of Newman-street, W., is the architect, and Messrs. Patman and Fotheringham were the contractors.

ILLUSTRATIONS.

"ROWTON HOUSE," NEWINGTON BUTTS.—"RED HOUSE," MILLIKEN PARK.—HOLY TRINITY CHURCH, SOUTHPORT.—MANSION HOUSE, DUMFRIESSHIRE.—BUSINESS PREMISES, CAMBORNE.—AGRICULTURAL SCHOOLS, NEWPORT.

Our Illustrations.

"ROWTON HOUSE," NEWINGTON BUTTS.

THIS double-page illustration is taken from Mr. Harry B. Measures' Royal Academy drawing, and illustrates the last built "Rowton House," which marks a distinct development in the homes of our Metropolitan working classes. The plans have, unfortunately, not reached us in time for illustration to-day; but we shall give them next week, with a detailed account of this great undertaking which has just been completed.

HOUSE FOR MR. A. B. MCKECHNIE.

"RED HOUSE" is erected on the lands of Johnstone, in Renfrewshire, on the western slope of the Gleniffer range of hills, not far from Milliken Park, and near to the site of the original and present Cochran Tower. The house is built of best Scotch terracotta red brick, and tiled with Ruabon tiles; the upper story being treated in half-timber work. The ground-floor contains three public rooms, besides kitchen and other accommodation, and the upper floor contains four bedrooms, bathroom, and studio. The drawings of the house, and also specimens of the proprietor's paintings, were hung at the recent Fine Art Exhibition in Glasgow. The architect is Mr. C. Davidson, of Terrace-buildings, Paisley.

CHURCH OF HOLY TRINITY, SOUTHPORT.

MR. HUON A. MATEAR, F.R.I.B.A., is the architect of this large church, of which we give a view from the original perspective shown at this year's Royal Academy. The plan presents several distinguishing features in church planning, while the external treatment is marked by boldness and breadth of handling worked out in brick and stone. The porch giving access to the morning-chapel is well contrived, and serves as an additional exit to the church itself. We have not received any particulars of the undertaking, and so are unable to supply the information.

MANSION HOUSE, DUMFRIESSHIRE.

IN THE BUILDING NEWS for August 27 we published a double-page view of this large house, which was designed for Mr. W. A. Coats by Mr. John A. Campbell, of Glasgow; we likewise printed a copy of the plan. To-day we give another view, showing the entrance front.

BUSINESS PREMISES, CAMBORNE.

THESE buildings are in course of erection at Camborne, Cornwall, for Messrs. Vivian Bros., of Camborne, and Dunedin House, Basinghall-street, London, E.C., merchants, who, in addition to their Cornish and London trades, do a large business with Johannesburg and South Africa generally, chiefly in drapery, outfitting, and fancy goods. The buildings face Market-place and Church-street, Camborne, and are

divided on the ground floor into drapery, carpet, outfitting, trunk, and tailoring departments, whilst the first floor is almost solely occupied by dresses, mantles, millinery, and fancy goods, the chief showroom measuring 104ft. by 30ft. The second floor will be occupied exclusively by workrooms for the employees of the firm, comprising separate departments for dress-makers, tailoresses, and milliners, with their separate refreshment-rooms. The walling will be in brick and stone, and the roofing of slate, whilst steel will enter largely into the construction of the floors and supports. When completed it promises to be the most important building of its kind in West Cornwall. Mr. Silvanus Trevail, F.R.I.B.A., of Truro, is the architect, and the builder is Mr. John Colliver, of the same place.

THE HARPUR-ADAMS AGRICULTURAL SCHOOL, NEWPORT, SALOP.

THIS design was placed first in open competition by the professional assessor appointed by the governors, and the author has been engaged to carry out the work. The buildings, which provide accommodation for 50 day boys and 50 boarders, comprise a large dining-hall, small dining-hall, schoolroom, two classrooms, and library, with large entrance-hall and suitable lavatories, cloak and boot rooms. A covered-way leads to a detached building, in which is placed a laboratory, lecture-room, preparation and balance rooms. Large and airy dormitories are placed on the first floor, with suitable lavatory accommodation and work for the assistant-masters. The head-master's house adjoins the school buildings. The kitchen, which is required to be used for both the master's house and the school, is centrally placed, and the servery is arranged between the master's dining-room and the dining-hall of the school. Accommodation is provided for the matron, and also an isolated sickroom for the students. A large laundry and ironing-room is provided, and also boiler, engine, dynamo, and accumulator rooms. The buildings will be of brick, the walls faced with Ruabon red pressed bricks, relieved with Grinshill stone dressings, and the roofs covered with brown Broseley tiles. The ground floors will be laid with wood blocks, and the first floor will be fire-proof. Most of the ground-floor rooms will have glazed brick dados. An electrical plant will be put down capable of lighting the whole of the buildings, and also pumping water from a well to the top of the building. The exhaust steam from the engine will be utilised to heat the water for warming the building. Each room is also provided with a fireplace. The ventilation will be by means of ventilating inlet radiators and extracts on roofs. The cost, including electric plant and laundry and cooking fittings, will be about £12,000. The architect is Mr. H. Teather, Andrew's-buildings, Cardiff.

CHIPS.

MR. J. DOUGLASS MATHEWS, C.C., F.R.I.B.A., was installed the Master of the Innholders' Company on Tuesday.

THE Painters' Company will hold their annual Feast of St. Luke at the hall, Little Trinity-lane, on Monday next.

A bas-relief portrait tablet, the work of Mr. A. Bruce Joy, is about to be placed in the chapel of Rugby School in memory of the late Archbishop of Canterbury.

THE Whitechapel Board of Guardians have severed their connection with the Forest Gate School District. They have dissolved the partnership in the schools which formerly existed between them and Poplar, and have handed over the schools entirely to Poplar. The Whitechapel Guardians are to erect instead cottage schools at Grays, Essex, and they are to receive as their share of the Forest Gate Schools £15,586.

A clothing factory capable of employing 500 people is about to be built at Pitsea, South-East Coast, for Mr. J. W. Humm. The architect is Mr. Arthur T. A. Bowyer, F.I.S.A., of Leadenhall-street, E.C.

THE will of Mr. Alfred Sacré, C.E., of the Westinghouse Brake and Yorkshire Engine Companies, who died in London in August, has been proved, the personalty having been sworn at £249,441.

AT a full-dress soirée to be held in the Walker Art Gallery, Liverpool, on Wednesday, November 3, Sir Wyke Bayliss, P.R.B.A., will deliver an address on "Art—in the House of her Friends."

COMPETITIONS.

BEXHILL PIER.—This competition appears to be a "limited" one—at any rate, by the number of particulars printed by those managing it. We have a post-card before us sent to one applicant, without name, address, or signature, which reads:—"Bexhill Pier.—The printed particulars had all been exhausted before your letter arrived. It is not proposed to print any more.—October 10, 1897." Curt, but hardly courteous!

BURY, LANCOS.—The Art Gallery Committee of the Bury Corporation had 33 applicants for the conditions of the gallery competition, and have received a total of 23 designs; these have been hung for exhibition in the Town Hall. Mr. R. Knill Freeman, of Bolton, F.R.I.B.A., has been appointed as assessor.

DARLSTON.—In a limited competition for a new brewery, the plans submitted by Messrs. Hickton and Farmer, of Walsall, have been placed first by the assessor, Mr. Wells, of Birmingham, and they have received instructions to proceed with the work.

HARRISBURG CAPITOL.—The Harrisburg competition has taken a new turn. At the suit of Mr. James H. Warner, an architect, of Lancaster, Pa., the Capitol Commission has been restrained by a preliminary injunction from adopting any design for the proposed Legislative building except one of the eight designs selected and presented by the Board of Experts, as provided in the programme of competition. Mr. Warner's design is said to have been classed highest in merit by the Board of Experts, and he is, therefore, a very proper person.

NEW YORK.—The competition among New York architects for the commission for the new home of the National Academy of Design on Morningside Heights, New York City, will close on October 31, when all designs must be submitted. In this limited paid competition the following architects were invited to compete:—George B. Post, Henry J. Hardenburgh, Babb, Cook, and Willard, Carrere and Hastings, Edward Pearce Casey, and Ernest Flagg. Each competitor will receive 500dol., and the author of the design chosen will receive the commission. The jury will be composed of four Academicians, and three architects appointed by the competing architects—Charles F. McKim, of McKim, Mead, and White; John G. Howard; and Mr. Peabody, of Peabody and Stearns, of Boston.

PLAYING CARDS.—The Court of Assistants of the Worshipful Company of Makers of Playing Cards have adjudicated upon the 174 designs sent in for the recent competition for prizes for the best designs for the backs of playing cards. The "H. D. Phillips Prize," of £5 5s., was awarded to Mr. Alfred Carpenter, 64, Charlotte-street, Fitzroy-square, W.; the second prize, of £3 3s., to Mr. S. B. Canton, 6, Beaumont-street, W.; and the third prize, of £2 2s., to Mr. Arthur G. Kinnear, of Trinity-road, Tulse-hill, S.W. One of these designs will be reproduced on the packs of cards to be presented to the members of the company and the guests present at the Master's and Wardens' inauguration banquet next month.

THE Adderly Edge District Council has decided to apply to the Local Government Board for sanction to borrow £3,000 for the purpose of securing land and erecting sewage works.

THE new workhouse infirmary, Newton Abbot, is being warmed and ventilated throughout by means of Shorland's patent Manchester stoves, with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

IN connection with the scheme of dock improvement at Liverpool, which has for some time engaged the attention of the Mersey Dock Board, it is stated that an outlay of something like four million sterling will be incurred. Amongst the works in contemplation is the modernising of the whole central docks, so as to enable them to be utilised at all states of the tide by vessels of the largest draught, and the provision of extended quay space. A new deep-water dock will probably be constructed on the Birkenhead side.

AT a meeting of the Board of Directors of the Jersey New Waterworks Co., Ltd., on the 8th ult., it was unanimously decided to extend the present filter-beds, and to add a new pumping engine to the works. Instructions were given to the company's engineer, Mr. H. G. Foster Barham, to prepare the necessary plans and specifications for the carrying out of the same.

Engineering Notes.

TIDAL LOCK AT WANDSWORTH.—A conference of the representatives of the various parishes on the Thames between Richmond and Wandsworth took place at the Hammersmith Town Hall on Friday to consider the report recently presented by Mr. Pritchard, C.E., recommending the construction of a new half-tidal lock at Wandsworth at a cost of £250,000. Mr. Chamberlin presided, and representatives were present from Hammersmith, Barnes, Mortlake, Fulham, Chiswick, Heston, and Isleworth. General approval was given to the proposal to put the lock below Putney; but the Fulham representatives thought that a full tidal instead of a half-tidal lock might be desirable, and those from Isleworth desired that the height of water retained by the half-tidal sluices should be increased, believing that otherwise they would not derive much benefit from the scheme. The matter was referred to a sub-committee to go fully into the question of details, and also as to how the financial side of the question should be dealt with. The London, Middlesex, and Surrey County Councils will probably be asked to contribute. The Wandsworth Board of Works, which has a scheme of its own, prepared by Messrs. Stevenson and Burstal, of Westminster, was not represented at the meeting. Messrs. Stevenson and Burstal's proposal is to maintain 3ft. greater depth of water than in the scheme proposed by Mr. Pritchard, thus keeping the water below the Richmond weir at practically the same level as that above the weir. The low-water level at Wandsworth would be raised 9ft. instead of 6ft. Mr. Pritchard, C.E., accompanied by the Fulham and Isleworth committee, made a visit of inspection to the alternative sites proposed for the lock, and promised to prepare a report as to the second site, that below the Wandle outfall, and also as to the relative cost of holding up another 3ft. of water.

On Wednesday night in last week, the members of the Hull branch of the National Association of Operative Plasterers held their annual dinner at the Queen's Hotel, Charlotte-street, Hull, when a large number of the members were present, including Mr. C. H. Clarke, president, and Mr. T. W. Walker, secretary. There were also present Councillor T. G. Hall, representing the Amalgamated Joiners' Society, and Mr. Tom Tighe, from the Hull Builders' Labourers' Society.

The contracts committee of Glasgow Corporation Gas Department have under consideration tenders for the supply of gas-piping for the city. For the pipes of a larger size a Philadelphia firm of good standing sent an offer, which was equal to £1 per ton less than of any British firm, the price including delivery in Glasgow. The committee are inclined to accept the offer, but have meantime delayed coming to a definite decision. By accepting the lowest British offer in preference to the American tender, the city would lose between £800 and £900.

The foundation-stone of the new workhouse hospital, which is being erected at Skircoats, Halifax, will be laid to-morrow (Saturday). The scheme will involve an expenditure of £120,000; but the guardians will carry out only a portion of the undertaking at present, making provision for some 420 beds, and this can be done at a cost of £95,000. On the completion of the whole plan, accommodation will be furnished for 600 beds. The plans of the new premises have been prepared by Mr. W. Clement Williams, architect, Halifax.

During the past two months the work of extending the Ripon and Wakefield Diocesan Training College, in the former city, has been actively in progress. The Education Department sanctioned the enlargement so as to accommodate 35 additional students; and the plans of the architect, Mr. J. Oldrid Scott, F.S.A., having been approved, the contract of Messrs. Ives and Co., of Shipley, was accepted, they having also the contract for the chapel and recreation-room. Messrs. Ives and Co. have undertaken to finish their part of the work by the 1st of July, 1898.

The foundation-stone of a new Wesleyan Chapel in Albany-road, Cardiff, was laid on Wednesday week. Designed to seat 950, and estimated when finally completed with tower to cost about £7,000, the structure will be in blue Forest stone, relieved with Bath stone dressings. The nave will be free from galleries, which will be placed over the transept. The pulpit will be on a level with the choir. In addition to the organ chamber, the adjuncts comprise vestries, parlour, and a classroom. The present contract is for £6,000. The architects are Messrs. J. P. Jones, Richards, and Budgen, and the contractors Messrs. Turner and Sons.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BRISTOL SOCIETY OF ARCHITECTS.—The session of this society was opened on Monday night by an inaugural address from the President, Mr. W. L. Bernard, F.R.I.B.A. The following is the programme for the session:—Nov. 8th, "Medieval Bristol," by Col. Bramble; Dec. 13th, "A Visit to a Cistercian Monastery," by G. H. Oatley; Jan. 10th, "Decoration," by H. Dare Bryan; Feb. 14th, "Some Ancient Roman Buildings," by M. Aston Green; March 14th, "Architectural Photography," by G. C. Lawrence; April 11th, Annual Meeting; and May 9th, "Plumbing," by Geo. Tuckey.

EDINBURGH ARCHITECTURAL SOCIETY.—The opening meeting of the second half of the session of the Edinburgh Architectural Society was held in Dowell's Rooms on Wednesday night in last week. Mr. J. A. Williamson, A.R.I.B.A., the president, gave his opening address, entitled, "Architecture of the Victorian Era," in which he sketched in outline the various phases through which architecture had passed during the Queen's reign, bringing the history down to the latest date. The net result, the lecturer pointed out, of the architectural activity of the last sixty years was that, compared with any former time, there was a greater wealth and variety of models to select from. But at present a stage of architectural license had been reached, in which Gothic and Classic forms and features were blended with surprising ingenuity, which the lecturer considered might defeat its own object, ending in reaction towards more archaic forms.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The opening meeting of the winter session of this society was held at the School of Art, Arundel-street, on Tuesday night, the President (Mr. R. W. Fowler, F.S.I.) in the chair. The President, in his address, remarked that they were desirous of securing a habitation of their own; but, so far, owing to want of funds, that had been impossible to obtain; and following that the collecting together of a library of professional and scientific works, a commencement with which had already been made. The conditions of competition for school-board work were not at all satisfactory in Sheffield, and the Council appointed a deputation consisting of Messrs. Hadfield, Gibbs, and Innocent to discuss the matter with the Board. The result of their interview had been to obtain an increase in the architects' fee from 6s. to 7s. 6d. per head of school accommodation, and some alteration in the conditions. The Corporation made formal recognition of the society by throwing open to the members of it practising in Sheffield a competition for a fire-brigade station, and also appointed its officers as assessors. The conditions of the competition, which were prepared by Mr. Innocent, and settled by him and Messrs. Gibbs and Hadfield, had been highly approved of by other kindred societies. On this subject he pointed out the advantage accruing to the Corporation from throwing open such competition to their body, instead of employing an architectural staff of their own, whose services could not always be in requisition, and who yet must necessarily be a permanent expense. They thus obtained the talents of practically the whole architectural profession in the neighbourhood, with very beneficial results, not only to themselves, but to the ratepayers at large. No large employer of labour would dream of carrying on his work on the principles that are urged as so necessary for some corporations. A railway company when making new lines invariably employed contractors, and on the high efficiency of that work depended the safety of thousands of lives in the future, and why a municipality should be unable to supervise piecemeal with the same satisfactory result as private individuals and other corporate bodies was a matter difficult of comprehension. He congratulated the society on the decision of the Wofinden trustees to throw open to competition amongst the whole of the members of that society the designs for the erection of a convalescent home and almshouses. After alluding to the lectures arranged for the forthcoming session he paid a tribute to the work of the honorary secretary, Mr. C. J. Innocent. The new goods station which the London and North-Western Railway Company were about to construct at the back of the Corn Exchange, the construction of the Sheffield District Railway, and the completion in the near future of the Great Central Railway's new line to London, could but

have a favourable effect on its commerce. A vote of thanks was accorded to the president for his address, on the motion of Mr. E. Winder, jun., seconded by Mr. J. B. Mitchell-Withers, and supported by Mr. E. M. Gibbs.

CHIPS.

The Wesleyan Book Room authorities have just come into possession, owing to the death of a well-known Methodist lady, of the original portrait of Mrs. Susannah Wesley, the mother of John and Charles Wesley. The oil-painting is by a famous painter of the last century. It is deposited at the Conference Office in London.

The heritors of Coldingham, N.B., appointed a committee last week to inquire into the present seat accommodation of Coldingham church, and to consider the question of the preservation of the old Priory, with power to consult an architect, and with instructions to report to a subsequent meeting of heritors.

The laying of Newmarket-street, Ayr, with tar macadam has proved so successful that the town council have begun to lay Alloway-street with the same material—a combination of stone and tar with granite powdered over all.

With an increased supply of properties last week at the Mart, the returns showed a substantial improvement, the aggregate realisation being £51,705.

At Friday's meeting of Dean of Guild Court at Edinburgh, Mr. C. W. Murison received warrant to erect a lodging-house at King's Stables-road. The building, which will be six stories high, will fill up the whole corner of the Grassmarket and King's Stables-road. It will cost between £12,000 and £15,000, and there will be accommodation for about 500 beds in the establishment.

The Birmingham Guardians have consented to the making of alterations and additions at the block for male epileptics at the infirmary, at an expenditure of £1,600. They have also agreed to the outlay of £1,500 upon a new laundry and the laying of new water-mains in connection with the Marston Green Cottage Homes, and to the expenditure of £2,300 for the provision of a new dining-hall and storage accommodation at the workhouse.

At a meeting of the Erpingham Rural District Council held on Monday, the 11th inst., Mr. Charles D. Watts, of the firm of Watts and Carter, architects and surveyors, of Sheringham and Cromer, was appointed, out of a large number of applicants, surveyor to the above council for the popular seaside resort. It was at first proposed to include Mundesley and Overstrand; but it was ultimately decided to consider the addition to the surveyorship later.

The town council of Bury, Lancs, had a lively discussion last week ament the amended plans prepared by Mr. R. Neill, and submitted by a committee, for the market proposed to be erected in Moss-lane. Eventually, by a small majority, the plans were adopted, and Mr. Neill was instructed to prepare a specification and quantities.

An inquiry was held at the County Hall, Beverley, on Friday, by the Light Railway Commissioners, the Earl of Jersey and Colonel Boughie, concerning the application for an order authorising the erection of the Beverley and Beaford Light Railway. The line would be 12½ miles, and is estimated to cost £30,000.

An accident took place recently in the lofty building of the American Tract Society in New York, by which an elevator fell through 19 stories, killing the elevator attendant and the engineer of the building. This is the fourth elevator accident that has taken place in the building since it was finished.

At Portsmouth, under the shadow of the parish church, which was erected a few years since from Sir Arthur Blomfield's designs, mainly through the munificence of the late Mr. W. H. Smith, the foundation-stone of a parish institute was laid on Tuesday by Lady Esther Smith. The institute will cost £6,500.

The new Lyceum Theatre at Newport, Mon., was opened on the 8th inst. The building provides accommodation for 1,250 people, and the cost has been £20,000. Mr. W. R. Sprague, of London, designed the new interior, and Mr. Linton, of Newport, was the contractor.

The London County Council adopted, on Thursday, the recommendation by the General Purposes Committee of the appointment of Dr. F. Clowes to the office of chemist to the council, in the place of Mr. W. J. Dibdin, who lately resigned the post. The salary is £700 per annum. There were 42 applications for the appointment.

Mr. William Arnot, who has been engineer to Glasgow Corporation Electric Lighting Department since its inception six years ago, has intimated his resignation. It is understood that this step has been prompted by the recent discussions on the electrical affairs of the city.

MANSION HOUSE · DUMFRIESSHIRE · JOHN A CAMPBELL ARCHT

This architectural drawing depicts the interior of a church, oriented vertically. The main space is a large nave with a high, vaulted ceiling supported by a series of pillars. To the right, there is a prominent organ loft with a large, circular window. The roofline is visible, showing a tall, ornate steeple with a pointed top. The drawing is detailed, showing architectural elements like arches, windows, and structural supports. The overall style is that of a technical architectural sketch or plan.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not infrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., L.I., L.II., L.III., L.IV., L.V., L.VI., L.VII., L.VIII., L.IX., L.X., L.XI., L.XII., L.XIII., L.XIV., L.XV., L.XVI., L.XVII., L.XVIII., L.XIX., L.XX., L.XXI., L.XXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. G. O.—A. H.—W. S. S.—C. S. M. Co.—M. M. (Bradford).—G. F. A.

Correspondence.

RHOS-ON-SEA BUILDING ESTATE COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—Some weeks ago you published a letter for me in the BUILDING NEWS, asking for information as to the above, but no reply was forthcoming. Surely some of your readers can tell me what has been done in the matter!

The plans were sent in on the 10th of January, and I am told that the competition has been settled months. I have written to the agent of the proprietor, but can get no reply. Neither my plans nor the deposit paid for the particulars have been returned. There must, I think, have been other competitors. I shall be much obliged for any particulars.—I am, &c., J. L. S.

POOR MORTAR.

SIR,—In reply to "W. E. M.'s" query in your issue for 8th inst., as to why "air is in a pulverulent state when freely exposed to lime," kindly allow me to say that the printer made me say something entirely different to what I did say. This is not the fault of the compositor who set up my letter, but the illegibility of my calligraphy. To put the matter clearly before my readers, I had better state what I did say, and then quote what your compositor made me say. Thus, in my letter in your issue of Oct. 1, the compositor sets up my matter thus (*vide* middle of the 18th line): "The CO₂ is imbibed by the lime, for the air, when freely exposed thereto, is in a pulverulent state." This is utter nonsense, as they will see when they compare it with what I wrote in my letter, which is the following: "The CO₂ is imbibed by the lime from the air

when freely exposed thereto in a pulverulent state."

Now as regards the "applying so many different names to the same substances may lead to confusion," I beg to differ, for this reason: Many chemical substances have a variety of names, and such substances are more commonly known to the public by the name given to them in drysaltery than by those given to them by the chemist. To give a few examples, green copperas, green vitriol, ferrous sulphate, sulphate of iron, and protosulphate of the oxide of iron are the various names by which the sulphate of the lower oxides of iron is known; but for every hundred persons who know what green copperas is not one person (I am only limiting the number for the sake of argument) would know what substance was meant if it were referred to under the last-mentioned name. So likewise with spirits of salts, killing salts, muriatic acid. These names are more familiar than the chemical name (hydrochloric acid, or chlorhydric acid, or chloride of hydrogen) by which this substance is known to the chemist. So again with bluestone, blue vitriol, blue copperas, the chemical name for which is sulphate of copper; white vitriol and white copperas are the names given to sulphate of zinc. Glauber's salt is the drysalter's name for sulphate of soda; salammoniac is chloride of ammonium, saleratus is carbonate of potash, oil of vitriol is sulphuric acid, and so on. Now, in my opinion, I find it is less confusing to state all the names by which a substance is known than to limit its designation to one or two names when it possesses half a dozen. My sole desire, when writing, is to make myself clearly understood by my readers, and if I succeed in doing this I am satisfied.—I am, &c., H. C. STANDAGE.

SIR,—In the interesting correspondence on this subject the kind of lime appear to have been ignored, as though chalk lime, stone lime, and lias lime should all be treated alike, which I take to be a mistake. The Romans slaked their lime, and kept it, or the mortar, a year at the least covered in pits. My reading is not comprehensive enough to enable me to know exactly the kind of lime they used; but I apprehend it was not hydraulic lias lime, but what we call a rich lime, such as chalk lime or stone lime, which latter is very slightly hydraulic. If so, the method they adopted is analogous to that of good builders of the present time, who, for particular small works, keep a stock of old mortar made of stone lime (take Dorking or Merstham as a standard), a rather rich lime, but very slightly hydraulic. This they slake on a sand bed, and afterwards cover with the sand for a day or two, then roughly incorporate the mixture and bank it into a heap, as compact and dense as possible, for use many months after. Mortar thus made and used, when re-tempered and beaten up before use, makes excellent work, and is much better than if used "hot." But it is not to be supposed that this is the equivalent of "laying it out exposed to the air," as one of your theoretical chemical writers infers. It is kept in a high-banked mass, often covered with sand. This appears to me to approach the Roman method of keeping in covered pits.

As to the supposed chemical action and reaction between the lime, the sand, and the carbonic acid of the air, none of the chemical theories lately advanced in your correspondents' letters appear to correspond with the actual experiments of the late Professor Lewis. He joined pieces of flint (in some cases with their clean natural fracture joints, and in others with polished surfaces) with slaked lime (chalk lime, stone lime, and lias lime), and freely exposed the pieces to the air, rain, and intermittent sunshine for years, and then examined the flint pieces both by naked eye and microscope, but could not find any change in the surfaces, nor could he detect any silification of the lime. And yet, if the theories above referred to are correct, he should have been able to do so.

Burnell on "Limes, Cements, and Mortars," 13th edition, p. 69, says: "The rich limes, inasmuch as they absorb the carbonic acid gas with difficulty, gain by being exposed for a longer period to the contact of the atmosphere. As far as such a proceeding is consistent with economy, it is advisable, then, to protract the operation of their manipulation as much as possible; it is even advisable to work up large quantities of such mortar beforehand, rendering it fit for use by a second manipulation."—I am, &c., F. J. N.

Intercommunication.

QUESTIONS.

[11809].—Fire Insurance.—Is it *infra dig* for an architect to be an agent for a fire insurance co.? Is it unprofessional for one to specify that their new buildings are to be insured during erection in the office he represents? Do better class architects act as insurance agents or not?—FALCONER.

[11810].—Joists in Concrete.—If, instead of plastering to a concrete ceiling, wood ceiling joists are used partly buried in the concrete and then lathed and plastered, will the ceiling joists become rotten?—F. KING.

[11811].—Cost of Draughtsmanship.—Architects have the reputation of not being business men; but can any general practitioner say what is a fair percentage on the average annual outlay on works executed to put down for the cost of draughtsmen's salaries? How much of the architect's 5 per cent. goes in assistants' time occupied in drawing plans, details, &c.?—LONKY.

[11812].—Professional Charges.—In laying out an irregularly shaped and uneven property of 3½ acres for building purposes, what should be the professional charges for (a) preparing estate plan and laying out? (b) Taking levels for and preparing plans, sections, and specifications for new roads, together with duplicate copies of same for contractor's use and for borough surveyor, and general superintendence of work? (c) Negotiating sales of building lots, with tracings in duplicate from estate plan for agreements to purchase, &c.?—S. H.

[11813].—Gauged Brick Arches.—Would some kind reader inform me, with illustrations—if the Editor will permit—how to draw, set-out, and make the moulds for a camber gauged-brick arch—i.e., one with a straight top, and only slightly curved or cambered intrados? The crux of the whole matter is to utilise the whole thickness of the brick at the top, so far as is consistent with equal thickness of bricks measured at right angle with a mean line along the middle of their length. I have read over and over again "Brickwork," by Walker, and "Brick-Cutting," by Hammond, both of Weales' series, published by Lockwoods; but they somewhat contradict each other. They both assume a knowledge in certain details and operations by the learner which they possess but do not impart, and the literal following of one of them would make the bricks next the skewbacks not only thinner in some cases and thicker in other cases than the others, but in one alternative would lead to making the mould for working the brick wider than the thickness of the brick to be manipulated.—A. HAMSON.

REPLIES.

[11794].—Parpoint Facing with Brick Lining.—Thanks to Mr. Freeman for his reply; but to call the outside facing of stone "parpoint" is, I think, a corruption of the true term. I should be glad if Mr. F. would state his definition of the term "parpoint," as I believe it to be a term specially applicable to stones finished and intended to be seen on both faces—such as parapets above roofs, &c., and therefore without brick or even rubble lining. Through-stones in hollow walls are a means of conducting the damp from the outside facing to the inside lining.—GALLATOWN.

[11800].—Ink.—The "glossiness" or wet appearance that is exhibited by some brands of ink is due to one or other of the following causes: either an excess of gum, dextrine, or glucose, with or without the addition of glycerine. The presence of the latter body in ink renders the ink a "copying ink"—that is, a facsimile copy can be obtained from the writing done with such an ink.—H. C. S.

[11804].—Building Construction.—The architectural questions in the Honours exam. can generally be answered from a knowledge of Rickman's "English Gothic Architecture," or Parker's "Introduction to Gothic," and of Leed's "Orders" (Weales' Series). Instead of these, however, one might take Smith and Slater's "Classic Architecture," and T. Roger Smith's "Gothic and Renaissance" (6s. each, Sampson Low and Co.). The best work to study for the sanitary questions is undoubtedly the "R.E. Professional Papers for 1891" (Vol. XVII.), published by W. and J. Mackay and Co., 176, High-street, Chatham.—H. BUSBRIDGE.

[11807].—Bath and Sink Waste.—The Creggen gully and channel, as per list herewith, will do what is required in a cheap and efficient manner. Write us for particulars.—J. STIFF AND SONS, High-street, Lambeth.

Joseph Pitts, a painter, was being hoisted up outside the tower of St. Paul's Church, Blackburn, on Tuesday in a swing seat, in order to paint the wood-work at the top, when the rope broke, and he was precipitated to the flagged pavement. He sustained terrible injuries, from which he died a few hours afterwards at the infirmary.

Operations are in progress in the Station-square, Cambuslang, in connection with the erection of the Diamond Jubilee Fountain, presented to the village by Mr. Hugh Glen, builder, and the unveiling will take place to-day, Friday. The fountain is of polished granite, and the site is a conspicuous one, opposite the new Free Church.

An arcade is being constructed from Lord-street to West-street, Southport, at an estimated cost of £40,000. In the centre will be an octagon 43ft. across, and having a balcony. The arcade will be entirely covered in with glass, heated with hot water, provided with seats and ornamental foliage, and lighted by electricity. The work is being carried out by local contractors, from designs and under the supervision of Mr. Geo. E. Bolshaw, architect, Manchester Chambers, Lord-street, Southport, and at Crews.

LEGAL INTELLIGENCE.

FAILURE OF A WREXHAM ARCHITECT.—John Ebenezer Lash, who resides at Mile End-terrace, Trefnant, Ruabon, and carried on business as an architect and surveyor at Temple-row, Wrexham, came up for his public examination, on Tuesday, at the local Bankruptcy Court. The gross liabilities were scheduled at £276 16s. 4d., expected to rank £266 15s. 8d., assets £34 16s. 10d., leaving a deficiency of £231 18s. 10d. He started business in 1876 without any capital, and in 1885 made an arrangement with his creditors. He then started again without capital. He did not think that any part of his insolvency was due to his personal extravagance. He had had a few betting transactions, but he did not think he had lost any money by them; he thought he was about quits.—The Official Receiver: You are very fortunate.—The examination was closed.

CHIPS.

The festival dinner of the Royal Institute of British Architects will be held at the Whitehall Rooms on the evening of Thursday, Dec. 2.

The first wing of the new Roman Catholic College at Blairs, near Aberdeen, was opened on Wednesday by Archbishop Macdonald, of Edinburgh.

St. James's Church, Piccadilly, will be reopened, after repair, cleaning, and decoration, under the direction of Sir A. W. Blomfield, A.R.A., on Sunday next, the 17th, with the annual harvest festival.

The finance committee of the Islington Vestry have recommended that Islington shall subscribe £2,000 towards the £23,000 required for the preservation of Churchyard Bottom Wood, at Highgate, from the encroachments of the builder, the stipulation being that the remaining £21,000 is assured, and that the £2,000 be raised by loan, and not paid from the current rate.

The memorial statue to the late Mr. R. W. Dale, which has been placed in the Birmingham Corporation Art Gallery, was unveiled on Wednesday. The statue, which is of marble, and is life size, is the work of Mr. Onslow Ford, R.A.

Major Cardew, R.E., from the Board of Trade, held an inquiry at the Town Hall, Halifax, on Tuesday, in reference to an application by the corporation for sanction to borrow a sum of £9,300 for purposes connected with the electric tramway scheme. There was no opposition.

A thorough renovation of the large organ of St. Paul's Cathedral is in progress. Among other additions is that of a celestial organ in one of the alcoves of the dome, the connection with the large instrument being made by electricity.

A new vestry for the choir boys has been erected in the north cloister of Ely Cathedral. On the west wall is a tablet with the name of the mother of the donor, Canon Dickson, for very many years Precentor. The work has been carried out under the direction of Mr. J. Oldrid Scott, F.S.A., the architect to the Dean and Chapter.

A chancel screen has been added to All Saints Church, Finchley-road. The material is alabaster, highly polished. It is intended to be a memorial of the Queen's Diamond Jubilee, and a tablet to that effect is placed at the base of the screen. It was designed by Mr. E. White, F.R.I.B.A., and executed by Mr. Forsyth, of Finchley-road, Hampstead.

Mr. J. A. Campbell, M.P., has offered to subscribe £1,000 towards the restoration of Brechin Cathedral. Another gentleman has offered to subscribe a similar sum, and it is therefore considered likely that the restoration will be effected. It would only cost about £10,000, as the cathedral is but small and is well-preserved.

The foundation-stone of the new R. C. Cathedral at Loughrea was laid on Sunday. £20,000 will eventually be expended on the building, which has been designed by Mr. Byrne, of Suffolk-street, Dublin.

The partnership hitherto subsisting between Messrs. C. D. Swale and F. Mitchell, architects and surveyors, Leeds, under the style of Swale and Mitchell, has been dissolved.

The sub-committee of the sanitary committee appointed to inquire into the nuisance arising from the pollution of the River Avon and the New Cut by the discharge of the Bristol sewage have unanimously resolved to ask their committee to report to the Bristol Town Council that the best way of dealing with the evil is to carry the sewage into the Bristol Channel by the plan of extending their main sewers.

The memorial stone of a new high school for girls and boys at Keswick was laid on Wednesday week by Lord Muncaster. The cost of the school and hostel, to accommodate 80 scholars and 24 boarders, will be rather over £7,000.

WATER SUPPLY AND SANITARY MATTERS.

ROTHERHAM.—Mr. G. W. Wilcocks, M.Inst.C.E., an inspector of the Local Government Board, held an inquiry recently into an application made by the Rotherham Town Council for sanction to borrow £55,269 for the purposes of sewerage and sewage disposal. The town clerk (Mr. H. H. Hickmott) mentioned that the population of the Rotherham borough was slightly over 50,000. The corporation decided to have constructed sewage disposal works, and they visited a large number of works in the country, ultimately coming to the conclusion that the one in operation at Wolverhampton was the best adapted for the district. They therefore engaged Mr. R. E. W. Berrington, the Wolverhampton engineer, whose plans and scheme they had adopted. A contract had been entered into for the purchase of 90a. 1r. 2p. of freehold land for £18,052 10s., as a site for the proposed works. Mr. Berrington produced plans and gave detailed particulars of the scheme. The sewage, after being collected and carried to the outfall works, would pass into tanks, the effluent going through two series of coal filters, and afterwards passing on to land, finally finding its way in a satisfactory condition as to purity into the river. The sludge would be treated and pressed, being available for farmers' use. Mr. Jennings, borough surveyor, was also examined.

Late on Saturday night, by a fire on the premises of Messrs. Warner and Sons, wood turners and timber merchants, of Canal-side, Worksop, damage estimated at £3,000 was done.

The reopening of the Free Methodist Church at Eighton Banks took place on Saturday, after partial rebuilding. The alterations have involved an expenditure of £600, and Mr. R. Stephenson, builder, Low Fell, and Mr. R. Bruce, joiner, Washington, were the contractors.

General Sir Redvers Buller laid, on Tuesday, the foundation-stone of the new church of Emmanuel, St. Thomas, near Exeter. Sir Redvers Buller has given the site for the new church. The building is to cost £9,000, is to be erected from designs by Mr. H. Brakspear, A.R.I.B.A., which were selected some time since in a competition in which an unusually large number of architects took part, will be in the style of the 16th-century Gothic, and will provide accommodation for 600 persons.

Professor Begas's design for a statue to be erected to Prince Bismarck in Berlin has been unanimously adopted by the committee concerned, and the order has been given to him. The Prince is in undress uniform and cloak, with his sword in his left hand. In front the pedestal is adorned with the figures of Atlas bearing the world, and of a smith forging a sword. Professor Begas wishes the statue to be erected near the fountain in front of the Reichstag, and as far from the building as possible.

At a private meeting of the Warrington Town Council, held on Monday night, Alderman J. E. Wright, J.P., architect, accepted an invitation to fill the office of mayor of the borough for the ensuing twelve months. This is, of course, subject to the approval of the new town council. Alderman Wright has been 15 years in the town council, and is a Conservative in politics. He is a chairman of the paving and sewerage committee, and also vice-chairman of the street improvement and lighting committee. He is the oldest in point of service of the members of the corporation who have not held the mayoralty.

Two ladies have offered to present to the Missions to Seamen a church for the use of seagoing men of the Port of London. The church, which is to be built in accordance with plans prepared by Sir Arthur W. Blomfield, A.R.A., and Sons, alongside the Missions to Seamen Institute in Poplar, with a covered way between, will be chiefly used for week-day services by sailors frequenting the Seamen's Institute.

An opera-house is about to be erected at Tunbridge Wells, from plans by Mr. John P. Briggs, of Arundel-street, Strand, W.C. The frontage is to Mount Pleasant-road; but the site is isolated on all sides, and the façades will be occupied by shops. The style is described as of the 12th century, with some Indian and Spanish features. The total seating accommodation will be for 1,500, and the stage will have an area of 40ft. by 60ft., with a proscenium opening 28ft. by 30ft.

The Wrexham rural district council opened at their last meeting ten tenders sent in for carrying out the Ruabon drainage works, there being a discrepancy of nearly £2,000 between the highest (which had no name attached) and the lowest, which was that of Mr. George Law, of Kidderminster. This, however, was so much higher than the estimate of the engineer (Mr. E. R. Martin, of Stourbridge), that the council, under the circumstances, declined to adopt any of the tenders at present. They appointed, however, Mr. T. E. W. Saint, of Tai Clawdd, as clerk of works for the scheme.

Our Office Table.

An exhibition of ancient and modern Mediaeval art-metal work is to be held at the Royal Aquarium, Westminster, early next year, which promises to be of an interesting character. The Directors of the Royal Aquarium have placed the arrangements in the hands of a representative Council of Advice, consisting of leading art-metal designers and workers and architects, the chairman being Professor Banister Fletcher, F.R.I.B.A., J.P., D.C.L., and amongst the rest Mr. George Frampton, A.R.A.; Mr. J. Starkie Gardner; Mr. Ellis Marsland, hon. sec. of the Society of Architects; Mr. E. J. Kibblewhite, the Editor of the *Building News*; Mr. Maurice B. Adams, F.R.I.B.A.; Mr. Lewis F. Day, Mr. W. A. S. Benson, Mr. F. W. Ruck, Mr. Gilbert Wood, and others. The exhibition will be divided into a Loan and Exhibit and Trade sections. Competitions for workmen are being arranged, and prizes will be given. All particulars as to terms for floor-space, &c., can be had of Mr. Edgar S. Shrubsole, organiser of the exhibition, Royal Aquarium, Westminster, S.W.

"The Paris Charity Bazaar Fire and its Lessons" is the subject of the paper to be read by Mr. Edwin O. Sachs before the Architectural Association on Friday evening in next week, October 22. The paper will deal, not only with technical facts regarding the construction of the fatal building, and include particulars of the fire, but will be fully illustrated by views of the structure taken before and after the conflagration, copies of the contractor's drawings, and other details which Mr. Sachs has brought over from France. The policy of the architect in generally trying to oppose or avoid regulations governing buildings will be dealt with, and the policy of the architect in saving his clients a few pounds, and thereby incurring a moral responsibility of much of the annual loss of life will also be treated of. Among those who have been invited by the association to attend the meeting with a view of participating in the discussion of the subject are: Mr. Thomas Blashill, the architect to the L.C.C.; Mr. Roberts, of the L.C.C. Theatres Committee; Mr. William Archer, the critic, as representing the public; and several of the leading fire-brigade officers.

On Saturday night, before a crowded audience at the Passmore Edwards Settlement, Tavistock-place, St. Pancras, Mrs. Humphry Ward delivered the opening lecture of the session in connection with that institution. The settlement, towards the cost of which Mr. Passmore Edwards gave £15,000 and the Duke of Bedford £1,500, in addition to the grant by his Grace of the use of two large gardens at a nominal yearly rent of £10, embraces a large lecture and concert-hall, accommodating 450 persons, class-rooms, gymnasias, library, and entertaining-rooms, and rooms for a warden and 18 residents. The buildings have been erected by Messrs Higgs and Hill, of Crown Works, South Lambeth, from plans by Messrs. Smith and Brewer, of Theobald's-road, W., and were illustrated in the *Building News* for July 3, 1896. It was in the large lecture-hall that Mrs. Ward gave her address. Mr. R. G. Tatton, warden of the settlement, presided. The settlement is intended to continue and develop on extended lines the work that has hitherto been conducted at University Hall and Marchmont Hall during the last six years. Its aim is to be a centre of education, recreation, and social life for the district, such as Toynbee Hall and other settlements are supplying in different quarters of London.

In connection with the Cambridge University extension movement, a course of ten lectures on "The History of Italian Painting," by Mr. G. Percival Gaskell, R.B.A., with magic-lantern illustrations, was commenced on Tuesday afternoon at the All Saints' Parish Room, Alma Vale-road, Bristol. The lecturer dealt with the beginning of Italian painting and the decay of Roman art with the decline of the Roman Empire. The rigidity and lifelessness of the Byzantine style was emphasised, several illustrations of Byzantine mosaic decorations and some of the National Gallery pictures, including "Margari-tone of Arezzo," being given. Giovanni Cimabue was spoken of as the first of the great Florentine painters, as he introduced greater life and feeling, and made the first great break from Byzantine tradition. Mr. Gaskell next referred to Duccio

Buoninsigna) of Siena, who was contemporaneous with Giotto (di Bondone). Whilst speaking of the latter, he gave a number of illustrations of his work, also of his frescoes at Florence, Padua, and Assisi. Under Giotto, art made a greater advance than under any single painter. The subjects of the remaining nine lectures are as under:—(2) Italian painters of the 14th century; (3) Florentine painters of the 15th century; (4) same, continued; (5) the Schools of Umbria and Ferrara-Bologna; (6) the Paduan and Early Venetian Schools; (7) Leonardo and Michael Angelo; (8) Raphael, Andrea del Santo, and Correggio; (9) the Venetian School of the 16th century; and (10) the Decline.

THE Bristol Town Council discussed for some three hours on Thursday the report of the Lunatic Asylum Committee, who proposed important extensions at the institution at Stapleton at a cost of about £45,000. Exception was taken to the report by some members of the council on the ground that, before embarking on so large an expenditure, considerably in excess of a former estimate, the committee should have called in a professional architect instead of intrusting such work as that to a clerk of works. It was replied that Mr. Withycombe, who was in the permanent employ of the corporation, was fully competent to fill both offices of architect and clerk of works, and that to employ an architect, as urged by the Bristol Society of Architects, would involve an additional £2,000. The members were not at all satisfied, and a proposal was made to refer the matter back to the committee. On a division, this was rejected by 24 to 20 votes, and the report was afterwards adopted, though a member intimated his intention to move the rescission of the resolution at a future meeting of the council.

JUDGING from the discussion that took place at the last meeting of the Mold Urban District Council relative to the appointment of a surveyor, the rule "Wales for the Welsh" is strictly applied in the northern border counties of the Principality, and the antipathy to Englishmen as office-holders is only exceeded by the rivalry between North and South Wales. At the meeting referred to, the clerk stated there had been received 29 applications from men living in all parts of England and Wales. Among the local names applying were those of Messrs. J. Meirion Williams, Broncoed; Richard Edwards, Cunliffe-street; and J. E. Davies, High-street. There was a statement of qualifications with each, together with two or three testimonials, the latter of which were not read. Mr. Marston proposed that all the applications should be accepted—that was, that the application should be in lieu of proposer or seconder, and that they should be in a position to vote direct on the application. After some conversation as to whether all the applicants had complied with the terms of the advertisement, this was agreed to. In the course of a discussion on the advisability of reading the testimonials in committee, Mr. Marston said they might as well acknowledge the truth. Probably most of them would vote for a local man. No one from South Wales, Stoke-on-Trent, Leeds, or London had the slightest chance, so let them decide there and then, even if it took them two or three hours to read the applications. This was seconded, but lost on a division, and eventually it was agreed to meet on a later date to make the selection. If these admissions are to be accepted, it seems waste of time for any but a Flintshire man to send in letters, and the advertisement inviting applications ought frankly to state: "None but natives need apply."

THE Improvement Committee of the London County Council, in a report submitted on Tuesday, called attention to the powers conferred on the council by an Act obtained in the present year. Three improvements are thus mentioned, the estimated gross cost being £841,990, and the net cost £839,490. One improvement consists of the northern approach to the Tower Bridge, another the widening of the Strand at Holywell-street, and the third that which is connected with Bozier's-court. The Holywell-street undertaking shows no reduction on the gross cost, which is £569,130. The same is the case with regard to Bozier's-court, which is estimated to cost £53,860. The gross cost of the Tower Bridge approach is estimated at £219,000, and there is a slight recoupment, but no "betterment." Under the Council's General Powers Act of this year, there is provision for four other improvements, the gross cost being £430,280, to be re-

duced to £383,880 by the sale of surplus land. The council will be asked at their meeting next week to take steps to put their powers in operation for the carrying out of these projects.

THE Salford Town Council at their last meeting rescinded the resolution passed by them on the 1st October, 1896, adopting plans for the erection of artisans' dwellings on Block 7 of the Housing of the Working Classes Scheme. They further authorised the preparation of new plans by a professional architect for the erection of artisans' dwellings. Mr. Huddart explained that the borough engineer had estimated that the dwellings would cost £10,527. The committee had just before completed a block on the opposite side of the street at a cost of £10,221. After the council had approved the scheme the committee advertised for tenders, and the estimates received were £15,985, £15,290, £16,400, £15,600, and £15,965. The committee then thought they could do no less than ask the council to rescind its former resolution and apply for more money. The borough engineer had given the reasons why the mistake had arisen; he said an erroneous calculation had been made; he had, in fact, estimated the cost on the same basis as that of the other property they had built in Queen-street, but since the latter were built builders' prices had gone up 20 per cent. The cost of these dwellings, it appeared, would be at the exorbitant rate of £280 for a two-room tenement. The lowest estimate was £15,200, and they had to add amounts for contingencies, the clerk of works' fee, the cost of preparing the estimate, and the paving, and the amount would come to about £17,000. He suggested that they should let the engineer in future do engineering work, and architects should be employed to do building work.

A BOARD OF TRADE Report was issued as a Parliamentary paper on Monday, showing the proceeding of the department in respect to tramway, gas, and water orders during the past session. The applications for provisional orders under the Tramways Act of 1870 were nineteen. In two instances the applications had reference to the use of electrical or mechanical power on existing tramways. With these exceptions, powers were sought for the construction of new lines. The aggregate length of such tramways was nearly 29 miles of double line, and above 43 miles of single line, the estimated cost of construction for the whole being £434,000. Four of the schemes related to new systems, and thirteen were extensions of existing lines. Four applications were not proceeded with by the promoters, for want of the consent of the local and road authorities. In a fifth case the application was withdrawn by the promoters, and a sixth could not be proceeded with owing to a non-compliance with the Act. In the remaining cases, thirteen in number, provisional orders were made by the Board of Trade, and were afterwards confirmed by Parliament.

The tower of St. Michael's Church, St. Alban's, which Lord Grimthorpe has just rebuilt, was reopened on Sunday.

St. John's Parish Church, Constitution-street, Leith, is about to be reopened, after the substitution of chair seats with sloping backs for the high-backed pews, the opening of fresh windows, improvement of ventilation, and internal decoration. Three windows have been filled with stained glass, the artists being Messrs. Dickson and Walker, of Edinburgh.

The annual exhibition of the Hull Society of Artists is now open, and is strong in the work in oils of ladies. Among the water-colours, the landscapes of Mr. John Somerscales, Mr. F. W. Booty, and Mr. T. B. Hardy may be named. Designs for wall-papers are shown by Mr. C. G. Lowther and Mr. M. S. Barnard, and Messrs. Harry Hems and Sons, of Exeter, lend a large collection of 15th-Century carvings in English oak, taken from various churches in Devonshire.

The Conway and Kelwyn Water Board, at their last meeting, received a letter from Mr. Bugbird, the contractor for the works, declining to accept the offer of the board in final settlement of his claim, and expressing his willingness to refer the matter to arbitration. The board had offered £1,280 on a claim of £1,764. The engineer (Mr. T. B. Farrington, C.E.) said there were about a dozen items in dispute between himself and the contractor, only three or four of which were of any magnitude. He suggested that a deed of reference should be drawn up, embodying the disputed items, and submitted to some professional gentleman to be mutually agreed upon. It was eventually agreed to refer the disputed items, representing £638 14s. 7d., to Mr. Thomas Jones, C.E.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Liverpool Architectural Society. "Compensations," by J. H. McGovern. 6 p.m.

WEDNESDAY.—Edinburgh Architectural Society. Lecture by W. H. Mellon. 8 p.m.

FRIDAY.—Architectural Association. "Practical Lessons from the Great Paris Fire," by Edwin O. Sachs. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

OCTOBER 22nd, ORDINARY GENERAL MEETING, 9, Conduit-street, W., 7.30 p.m. Paper by Mr. E. O. SACHS, "PRACTICAL LESSONS FROM THE PARIS BAZAAR FIRE." E. HOWLEY SMITH, } Hon. Secs.
G. B. CARVILL, }

CHIPS.

The inaugural meeting of the session 1897-98 of the Surveyors' Institution will be held at the Medical Examination Hall, Savoy-street, Victoria Embankment, on Monday, November 8, when the president, Mr. Christopher Oakley, will deliver an opening address. The chair will be taken at 8 p.m.

The Streets Committee of the Darlington Town Council having considered the plans sent in for carrying out the High-row improvement, came to the decision that the plan marked "Labour Omnia Vincit" was the best scheme submitted. The report and recommendation were adopted by the town council at their last meeting, and on opening the accompanying envelope the author proved to be Mr. A. W. Roberts, 9, St. John's-crescent, Darlington.

The urban district council of Menai Bridge have decided to provide a pier, and to offer a premium for the most suitable design.

Reporting to the Scarborough Corporation, Mr. J. E. Everett, the resident engineer for the construction of the road round the Scarborough Castle Hill, states that the scarping of the cliff at the north-east corner has been practically finished. The sea wall is being pushed forward at the eastern end. A plan for the construction of an apron to the sea wall in the North Bay, at an estimated cost of £765 has been approved.

The Darlington Rural District Council have appointed Mr. John Robinson as highway surveyor in succession to his father, lately deceased, Mr. William Robinson, who had held office over 30 years, and who was in turn the son of John Robinson, appointed over 70 years ago to superintend the main roads between Stockton and Barnard Castle, and also contractor for keeping in repair the county bridges and bridge roads.

The first public distribution of medals, prizes, and certificates to students at the Wandsworth Technical Institute took place on Monday night in the Town Hall. There are in daily attendance at the classes 378 students, 94 being young women, and the governing body are proud of the fact that the silver medal for brickwork, offered to the whole country by the City and Guilds of London Institute, was carried off by Mr. A. W. Stokes, one of the Wandsworth students; while the bronze medal for carpentry, offered to national competition, fell to the lot of Mr. H. Smith, also one of the students. After the distribution by Dr. Garnett, Mr. W. T. A. Emtage, the principal of the institute, read his report, which reviewed the plan pursued in the several classes.

Owing to the extensive tourist traffic, the line between Skegness and Firsby (where the Skegness branch joins the East Lincolnshire line) is to be doubled by the Great Northern Railway Company, the estimated cost being £30,000.

The stone bridge which has been erected over the river Conway at Talycafn, and which will supersede the ancient ferry, was on Saturday opened by the Mayor of Conway. The contractor was Mr. Thorne, London, Mr. Dawson supplying the designs.

The opening of the new Workmen's Institute at Westbury-on-Trym took place on Friday. The architect was Mr. W. L. Bernard, and the contractor Mr. E. Walters.

The Todmorden Town Council are applying to the Local Government Board for sanction to borrow £4,150 for purposes of public walks and pleasure grounds on the Stile Estate, and £6,500 for the purchase of premises opposite Waterside Mill for purposes of a depot, fire-engine station, wharf, stables, &c.

HAM HILL STONE. DOULTING STONE.

THE HAM HILL & DOULTING
STONE CO.

Incorporating THE HAM HILL STONE CO. and C. THACK AND SONS (THE DOULTING STONE CO.)

Chief Office: NORTON, STONE-UNDER-HAM, SOMERSET.
London Agent: Mr. E. A. WILLIAMS, 16, CRYSTAL STREET, STRAND.

LIST OF COMPETITIONS OPEN.

Pickering & Kirbymoorside—Gravitation Water-Supply Scheme	No Premium	Robert Kitching, Clerk to Pickering R.D.C., Pickering	Oct. 16
Colne—Technical School, Free Library, and Public Hall (£5,500 limit)	£50, £35	Alfred Varley, Town Clerk, Town Hall, Colne, Lancs	20
Wolverhampton—Free Library (selected Architects)		The Town Clerk, Wolverhampton	23
Eastcote and Northwood, near Ruislip—Sewerage Scheme	£10 for Combined Scheme, £15 for Eastcote, and £25 for Northwood.	C. Woodbridge, Clerk, R.D.C., 33, High-street, Uxbridge	30
Byfleet—Village Hall and Workmen's Club (£1,500 limit)	25 Guineas	F. C. Stoop, Hon. Sec., Albany House, Byfleet, Surrey	Nov. 13
Southend—St. Alban's District Church	No premium offered; no Assessor named	Rev. E. C. Kimber, Avenue-terrace, Southend-on-Sea	20
Well's City—Public Hall	£25, £15, £10	Reginald L. Foster, City Clerk, 1, Cathedral-green, Wells, Somerset	30
Mexico—Legislature Palace (1,500,000dol. limit)	15,000dol. Mex.	Secretary Public Works, Mexico City	30
Cardiff—Town Hall and Law Courts (A. Waterhouse, R.A., Assessor—£200,000 limit)	£500 (merged), £300, £230.	J. L. Wheatley, Town Clerk, Town Hall, Cardiff	Dec. 4
Nottingham—Laying-out and Planting Basford New Cemetery.	£100, £50.	Samuel G. Johnson, Town Clerk, Nottingham	15
Nottingham—Designs for Basford Cemetery Buildings: Chapels, Crematorium, Lodges, &c.	£100, £50.	Samuel G. Johnson, Town Clerk, Nottingham	15
Carlton, Victoria—Children's Hospital	£100, £50, £25	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	(1898) Jan. 30
New York—Sun Dial (Plaster Model)	500dol., 250dol.	Sec. National Sculpture Soc., 215, West 57th-street, New York	(1898) Feb. 28
Brighton—Artisans' Dwellings (local Architects only)	(No first) £150, £100, £50	Secretary Building Committee, Newcastle	(1898) Mar. 1
Boscombe—Hospital Enlargement, Shelley-road	£75, £25	F. J. Hulstone, Town Clerk, Brighton	—
Carlisle—Board School (530 places)	£20, £10	J. Pratt, Assistant Sec., 126, Christchurch-road, Boscombe	—
Tottenham—School Board Offices		S. Cartmell, Clerk, 27, Lowther-street, Carlisle	—
Bexhill-on-Sea—Promenade Pier and Garden		J. F. Adams, Clerk, School Board Offices, Tottenham, N.	—
Blackburn—R.C. Infant School, Dean-street	(No first) £5	Secretary, Pier Co., 7, Sackville-road, Bexhill	—
Lichfield—Nursery Home and Invalids' Kitchen	£10, £5	The Rector, 48, Islington, Blackburn	—
Dukinfield—Town Hall (£7,000 limit)	£40, £20	R. R. Redmayne, Secretary, 22, Dam-street, Lichfield	—
		Samuel Hague, Surveyor U.D.C., King-street, Dukinfield	—

LIST OF TENDERS OPEN.

BUILDINGS.

Buckfastleigh—Additions to Farm Buildings at Torr Dean, and Additions to Stables at Bigadon House.	Co-operative Society	J. Fleming, 9, Biliter-square, London, E.C.	Oct. 16
Silsden—Twelve Houses	Guardians	R. P. Holdsworth, Secretary, 1, St. John-street, Silsden	16
Londonderry—House, Upper Violet-street		Wm. Barker, Architect, Richmond-street, Londonderry	16
Callan—Fifty-eight Labourers' Cottages		John F. Shelly, Clerk, Board Room, Callan	16
Gorleston—Mission Buildings, High-street		S. Rivett, M.S.A., 5, South Quay, Great Yarmouth	16
Knottingley—Additions to The Croft.		Willie Wrigley, Architect, 6, Westgate, Wakefield	16
Warrenpoint, Maguiresbridge, Crumlin, and Ballinderry—Station-Masters' Houses.	G.N. Railway of Ireland	T. Morrison, Secretary, Amiens-street Terminus, Dublin	18
Bradford—Reinstating Hill Crest Oil Works, Laisterdyke	Wm. Laing and Co.	Empsall and Clarkson, Architects, 7, Exchange, Bradford	18
Elgin—Additions to South View House	Misses Clayton	C. C. Doig, Architect, Elgin	18
Morecambe—Three Cottages.	Stretford Urban District Council	J. Marshall, Architect, Back-crescent, Morecambe	18
Old Trafford—Refuse Destructor.	Guardians	John Bowden, Architect, 14, Ridgfield, Manchester	18
Leeds—Wards for Imbeciles, the Workhouse		J. Mitchell Bottomley, 46, Albion-street, Leeds	18
Bradford—Nineteen Houses, Cornwall-road	Mr. T. Baxter	Milnes and France, Architects, Bradford	18
Morecambe—Nine Houses and Four Shops, Moss Park Estate.	Board of Guardians	J. Marshall, Architect, Back-crescent, Morecambe	18
Hull—Dormitories and Mortuary, Workhouse	School Board	R. H. Winter, Clerk, St. Mary's Chambers, Lowgate, Hull	18
Bradford—Baths, &c., at Wapping-road School		C. H. Hargreaves, Architect, Exchange-buildings, Bradford	18
Craigellachie—Additions to Hotel	St. Crispin's Productive Society	Reid and Wittet, Architects, Elgin	18
Raunds—Factory	St. Marylebone Board of Guardians	Chas. Groom, Secretary, Raunds	18
Notting Hill—Nurses' Home	W. C. Farrar	Hy. T. Dudman, Clerk, Guardians' Offices, Northumberland-st., W.	18
Morecambe—Shops, Warehouses, &c., Regent-road	School Board	J. Marshall, Architect, Back-crescent, Morecambe	18
St. George—Girls' School (for 420), also Enlargement to present School at Summerhill	School Board	F. Bligh Bond, F.R.I.B.A., 51, Corn-street, Bristol	19
Sketty—New Gallery and Reseating at Eng. Cong. Chapel	Town Council	D. Davies, 2, Greenfield-terrace, Sketty	19
Barrow—Additions to Caretaker's House, Barrow Island School		W. Hutchinson, Clerk, Barrow-in-Furness	19
Kingston-on-Thames—Alterations to Baths	Urban District Council	H. A. Winsor, Town Clerk, Kingston-on-Thames	19
Alnwick—Additions to Training School	Urban District Council	R. R. Templeley, Clerk of Works, Alnwick Castle	19
Barking—Public Baths	Urban District Council	E. H. Lister, Clerk, Public Offices, Barking	19
Goole—Alterations to Market Hall		Geo. England, Clerk, Goole	19
Morecambe—Additions at 9, The Crescent	Guardians of Croydon Union	J. Parkinson, Architect, 67, Church-street, Lancaster	19
Thornton Heath—Boundary Wall at Cottage Homes, Mayday-rd.	School Board	Frederick West, Surveyor, 23, Coombe-road, Croydon	19
Coventry—Additions to Red-lane Board Schools	Guardians of Bucklow Union	G. and I. Steane, Architects, 22, Little Park-street, Coventry	20
Londonderry—Presbyterian Lecture Hall	Pier Co.	Wm. Barker, Architect, Richmond-street, Londonderry	20
Knutsford—Piggeries at Workhouse		George Leigh, Clerk, Union Offices, Knutsford	20
Morecambe—Concert Pavilion on Pier Extension		E. Hill, Secretary, Morecambe	20
Ballyclare—House and Stables		T. H. Jordan, 31, Garfield-street, Belfast	20
Aberdeen—Public School at Kittybrewster	School Board	Thomas Hector, Clerk, 31, King-street, Aberdeen	20
Purston—Two Houses and Shops.	H. Palfryman, Featherstone Corporation	Garside and Keyworth, Architects, Pontefract	20
Morley—Public Baths, Fountain-street.	School Board	Holton and Fox, Architects, Westgate, Dewsbury	20
Coventry—Additions to Red-lane Board Schools		G. and I. Steane, Architects, 22, Little Park-street, Coventry	20
Pontnewydd—Renovating Richmond-road Baptist Chapel	Mumbles Railway and Pier Co.	James Russell, Commercial-secretary, Pontnewydd	20
Mumbles—Pier Refreshment Rooms and House.	Loyal Sudeley Lodge of Oddfellows	E. A. Watkins, Secretary, 2, Rutland-street, Swansea	21
Winchcombe—Alterations to Three Cottages, Gloucester-street	Corporation	Conrad Hall, Winchcombe	21
Kingston-on-Thames—Victoria Hospital Buildings		Town Clerk Office, Clatter House, Kingston-upon-Thames	21
Belfast—City Hall	Sanitary Committee	Sir Samuel Black, Town Clerk, Belfast	21
Preston—Sanatorium, Royal Cross School	Hartley Wintney Board of Guardians	Sames and Green, Architects, 65, Northgate, Blackburn	21
Eastbourne—Model Common Lodging-House	J. L. Hunt	W. Chapman Field, Borough Architect, Town Hall, Eastbourne	22
Winchfield—Cottage Home	Royal Navy Reserve	F. S. Chandler, Clerk, Odiham, Hants	22
Great Yarmouth—House, Gordon-road, Southtown.	School Board	C. G. Baker, Architect, Town Hall Chambers, Yarmouth	22
Kennetmouth—Distillery, Houses, and Cottages		C. C. Doig, Architect, Elgin	22
Lowestoft—Batteries and Drill-Shed		Director of Works, Admiralty, Northumberland-avenue, W.C.	22
West Morsea—Schools for 365 Children		J. W. Start, F.S.I., Architect, Colchester	22
Manchester—Offices, Workshops, &c., Hydraulic Pumping Station	Waterworks Committee	The Secretary, Waterworks Offices, Town Hall, Manchester	25
Purton and Suckley—Cottages at Collin's-lane Crossing, near Purton, Gloucestershire, and Suckley, Worcestershire	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, W.	26
Featherstone—Village	Dr. Stevens	Garside and Kegworth, Architects, Roper-gate, Pontefract	26
New Bilton—Cottage near New Bilton	Rugby Co-operative Society	Geo. Adams, Manager, 45, Chapel-street, Rugby	26
Westbury—Cottage near Orange Court.	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, London	26
Kendal—R.C. Schools, Gillingate		J. Stalker, M.S.A., Kendal	26
Douglas, I.M.—Murray's-road School (1,000 places)	School Committee	T. R. Lewin, Clerk, Douglas, Isle of Man	26
Windsor—New Passenger Station	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station, W.	26
Dagenham—Ward at Smallpox Hospital.	West Ham Corporation	F. E. Hilleary, Town Clerk, Stratford, E.	26
Hampstead—Enlargement and Alterations, Fire Brigade Station	London County Council	C. J. Stewart, Clerk, Spring-gardens, S.W.	26
Leeds—Public Baths, Meanwood-road	Baths Committee	Walter Hanstock, Architect, Branch-road, Batley	26
Preston—County Intermediate School	Guardians	H. Teather, Architect, Andrew's Buildings, Queen-street, Cardiff	29
Birmingham—Dining-hall and Stores at Workhouse	Dr. Mason	W. H. Ward, Architect, Paradise-street, Birmingham	28
Windermere—Residence	H.M. Office of Works	Robert Walker, F.R.I.B.A., Windermere	28
Surbiton—Branch Post and Sorting Office		Hon. Reginald B. Brett, C.B., Secretary, 12, Whitehall-place, S.W.	28
Shrewsbury—Engine and Boiler Houses and Chimney Shaft at Coleham	Corporation	Henry C. Clarke, Town Clerk, Guildhall, Shrewsbury	29
Horrabridge—Alterations to Board School	Guardians	Wm. Squire, M.S.A., Tavistock	30
Christchurch—Addition to Workhouse, Fairmile	Board of Guardians	A. Druitt, Clerk, Christchurch	30
Falmouth Workhouse Infirmary		J. H. Genn, Clerk, Falmouth	30
Monorhamilton—Repairs to Courthouse	Barry Railway Company	E. O'N. Clarke, County Surveyor, Carrick-on-Shannon	Nov. 1
Barry Dock—Offices	Board of Guardians	W. Mein, Secretary, Barry Railway Company, Barry Dock	1
Barnes, S.W.—Six Shops and Houses, Rocks-lane		F. and W. Stockers, Surveyors, 90, Queen-street, Cheapside, E.C.	2
Chelsea—Meat Store and Larder at Cale-street Infirmary		Wm. Muller, Clerk, 250, King-street, Chelsea	2
Furnham—Isolation Hospital		E. Crundwell, Clerk, South-street, Farnham	3
Bedford—Post Office	H.M. Office of Works	Hon. Reginald B. Brett, C.B., Secretary, 12, Whitehall-place, S.W.	6

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2233.

FRIDAY, OCTOBER 22, 1897.

AGENCY VERSUS ART.

IF it is agreed that a work of architecture is the product of a number of trades, the work of the architect should be to see that these trades were properly carried out in the building, and he ought to be sufficient master of each to know when they were performed with skill and completeness. Such a knowledge no doubt implies a formidable task of preparation and study, often beyond the capacities of young and inexperienced men, and yet nothing less than this is the opinion of the leading members of the profession. The ideal of those who maintain that the architect ought to be a master craftsman is very much higher than that entertained by the ordinary professional man. The latter looks upon the various craftsmen as so many passive workers to be employed and kept in line with each other, whose work individually has no influence on the design. They are regarded as so many tools to carry out certain parts of the design according to instructions—never to deviate from it without order. The architect assumes more the agent than an artist. These opposite views of the function he is called upon to perform make a wide difference as to qualification. To the first, each trade is not only engaged in carrying out a definite portion of the design, but the tradesman is a joint artist in the production of it, as if the architect had distributed his design and specification among so many working masons, carpenters, joiners, smiths, and plasterers, and they each worked out their part to the best of his ability, independently of, though concurrently with, the architect. But, according to the generally-accepted view of the building trades, the workman has no individuality, and has simply to follow instructions issued through the contractor from the architect. Which view accords best with existing conditions we leave the reader to see. The latter view is easier for both architect and workman. The one has simply to order and give instructions, the other to obey. If we look at our modern buildings in the light of these different systems, we shall find a great deal to illustrate the results of each of these views. Our streets are full of buildings made up of trades directed by agents. Every trade is a question of quantity, of cubic feet of stone, feet run of mouldings, superficial of floors and glazed partitions, of lineal feet of machine-made mouldings, of plaster, glass, iron, and painting—all at so much the yard or foot superficial or weight; but in none of these things do we find any evidence of that imaginative faculty which makes our older buildings so interesting and so instructive. The evidences of contract meet us when we look into any public building, great hotel, or shop. We see every trade and detail has been cut down to a price; that the tradesman has been regulated by the "quantities," not by what he considered to be the best. The consequence is that machine-labour is everywhere apparent. If it is a piece of ornamental woodwork, turned and circular-cut mouldings are combined to dispense with hand-wrought work. The finished workmanship and manual skill of the last century is conspicuously absent. There is no imagination, for this is crushed out by organisation of one sort and another, the masters' greed and the men's unionism. The organiser is now the man who is the head of affairs. The organising architect has the charge of many agencies; he simply has to set the machine in

motion. The contractor is nothing if not a good organiser of labour, with the power of keeping his men all going. So with the great manufacturer or City merchant: the men count as mere units, and all sympathy is crushed out. The commercial and competitive environment has never made the architect anything beyond his office or his drawing-board, or the craftsman to take any interest beyond his wages or his tools. Trade has now become a commercial business; it is no longer a craft as it was before builders lost their old traditions, when the guilds fostered the genius of the workers in their several branches. The modern system has tended to obliterate the lines which distinguish one craft from another, and has discouraged personal ability. The technical schools and classes are based on the idea that a youth may learn one craft as well as another, that there is no special faculty required, and that a man may be equipped in all trades. This is up-to-date teaching, and has given us the all-round builder and tradesman. The same idea has prevailed amongst the profession; the architect must be taught all the branches, learn every style or period, and be turned out able to design any building. It is no longer a matter of ability or taste: his pencil and box of instruments are thought to make him competent to undertake any kind of building. And the academical teaching of the present day is all that is necessary;—he can apply Greek or Gothic or Byzantine to any building, no matter how diverse. We can trace this superficial view of trade and art to the 16th century, when, as Mr. Blomfield in his "History of Renaissance Architecture in England" says, the builders, losing their traditions, were tempted to bold experiments for which they were unprepared. He writes: "The specialisation of building had already begun; the builder, instead of being an artist, who built and designed in one and the same process, was becoming a person who built buildings, and then thought it necessary to adorn them with ornamentation borrowed at random." The identification of designing with the builder and workshop was lost sight of by the new régime. Something very different has taken its place—easier for the designer, who may be quite ignorant of his material, and confine himself to his drawing-desk, and easier also for the tradesman, who can take advantage of the designer's incompetence or indifference. The design may cover all the possibilities of incompetence and blundering and bad copyism; but what matters? The contractor takes all the risks and responsibilities of the execution, and the result may be as near an approach to the architect's intention as the profit of the contractor will permit. He can introduce stock mouldings, old castings and patterns, and other cheapening processes without in the least arousing the suspicions of the architect, who may be only too glad to see his details executed with the least trouble to himself.

In his inaugural address at the Association, Mr. Hampden W. Pratt quoted a passage of Mr. Ruskin delivered many years ago, which expresses very clearly the existing condition of building art. He was referring to the qualities which distinguished great from mean artists—namely, imagination and industry. Of these imagination is the greatest. "It was not manipulation, or calculation, or attention; it was something more, something higher than all or any of these. If an architect lays his bricks and stones well, we praise him for his manipulation; if he keeps well within the contract, we praise him for his calculation; and if he arranges his beams so that nobody drops through his floors, we praise him for his caution. But, if he is to be a great architect, he must do something more than possess and exercise these qualities." These words convey our meaning. We have much manipulation and calculation in our

building work: everything is measured and analysed—the stresses of our girders and roofs, the chemical composition of our stone and brick earths, even the quantities of our iron and stone and timber. Our illustrious predecessors never dreamt of these niceties, and yet they produced work full of thoughtfulness and imagination. It is true that critical research and analysis has almost robbed us of our faith, and the specialisation of our crafts appears to have crushed out individual effort, till the working mason, the joiner, or smith thinks his only duty is to manipulate his material to the most profitable advantage. Our architects must do something more than measure building materials and calculate stresses—they must enter into the personal equation of the workman, consider his difficulties, and aid him in his work. It is not in the sense of specialisation nor analysis only that the architect must study workmanship; nor in being able to order and organise the trades of buildings after the manner of an agent; but he ought to be able to see the realisation of his design through, and not independent of, the trade. No doubt it is very hard to attain to this standard of the architect's work: it means harder work for him than mere official routine and commissions.

Why is it that competition weighs so heavily upon the building trades? Is it not because the work of the craftsman has not been assessed at its true value; that our architects are not fully competent to judge of quality of workmanship, and therefore they accept tenders at a loss? We hear on all sides that estimates or tenders are made from sheer ignorance or from guesswork. The builder tenders from unknown facts or imperfect quantities or specifications. He puts in a mere guess for what he does not know exactly: he wishes to secure the contract at any price; and corporations and public bodies abet this kind of chance competition. The inadequate specifications and incompetent details are at the root of all this uncertainty. If these were full and precise, there could be no guessing, and contractors would not venture to affix prices to items which they knew were to be insisted on. As they now appear, the under-bidding builder trusts to the vague and indefinite clause, and to the incompetence of the architect in particular trades. This incompetence and vagueness are at once revealed by the flimsy and superficial description, devoid of actual facts. Only a full and perfect specification will justify a fair and reasonable competition. On no other basis can it be insured. Manufacturers justly complain that inferior articles and workmanship are placed in competition with those of superior merits by the "juggling" of speculative builders who can, out of a vague specification, ask for quotations for two very different things—one an inferior and one a very superior article, and, of course, accept the price of the former. For example, an article of ironmongery is specified in general terms; the contracting party asks for a reduced price, and represents to the manufacturer that for the same article another competing firm has made a lower offer. Unguardedly, the unwary tradesman yields, but soon discovers his mistake. The specification has been taken in two ways, or the competing tradesman does not exist. Examples of this sort of dealing are common, and can only be resisted by making good workmanship synonymous with art.

INSTITUTE OF PAINTERS IN OIL.

ON the walls of the Institute of Painters in Piccadilly are to be seen a few works of more than the ordinary show sort. Of course, we find a great many of the popular engraving variety, and no gallery is free from this element. Like all other branches of art, the demand for the popular

and pleasing picture will always create a supply amongst artists of a certain kind. In the West Gallery we notice Hugh Carter's "Old Highland Woman" in white cap, plying her scissors. Like other of Mr. Carter's works, it is Dutch like, full of quiet sentiment; the light from the cottage window is cleverly thrown over the white cap. Near it E. Davies' view in "Charnwood Forest, Lincolnshire," is pleasing in the gleaming field of ferns; and Lawrence Koe's "Roses," a study of a girl holding a bunch of pink roses, is a nice harmony of yellows and green. H. Fantin-Latour has a vigorous piece of flower-painting "Fleurs Variées" (8), and No. 16, admirable in colour. The vice-president, Frank Walton, sends a small sunny landscape, "Ockham Farm" (10), in which the hayfield is tenderly painted; but his principal work is in the central gallery, a view of "Cover Wood, Holmby Hill," a thickly-wooded upland with leafless trees; a golden flood of autumnal light suffusing the landscape. The handling is extremely skilful and delicate. We pass a work entitled "Mutual Curiosity," by Robert Fowler—a partially-draped maiden standing behind a piece of rock at the side of a lake, while an inquisitive tortoise on the other side looks up inquiringly. The subject is curious and the meaning not very clear; but there are good qualities in the colour and handling. Fred. Weekes' "On Outpost Duty" (19), a horseman and his steed examining an object in a wild snow-clad tract, and the late T. Hope McLachlan's "Evening Quiet," are works of some interest. Harold Speed (28) has a broad piece of meadow, starred with daisies and buttercups, "Early Spring"; T. Austen Brown has a clever subject, "Winter" (30); but his "Homewards," in the next gallery, is a strong and vigorous handling after the Glasgow School. We must note, also, among the few subjects of mark, John J. Richardson's "Welcome Shade," in a crisp style; Miss Harriet Ford's "Santa Maria" (34) the head of a maiden decoratively handled, head reverential in treatment; Miss Henriette Ronner's group of kittens, "Indolence"; Dudley Hardy's "A Nomad" (36); Edward Brewtall's large picture of a wrecked vessel near rocks, lighted up by a crimson sunset with storm clouds gathering (38); the landscape by Edward W. Waite (45), a village of tiled cottages embowered in foliage; Fred Morgan's pleasing piece of *genre*, "Shuttlecock" (48), are works of some merit. St. George Hare's subject, "Butterflies" (61), is conceived happily; but the little girl in white satin, who is trying to catch a butterfly, lacks expression. In breadth, atmosphere, and vigour of handling, E. M. Wimperis has seldom done anything so good as "A Dartmoor Storm" (65), a rushing torrent from the mountains, cleaving its way through a rocky bed; the stormy clouds and the overflowing bubbling stream are painted with power. "Tavy Cleave" (342) is another Dartmoor landscape, skilfully painted in its atmospheric effects. Reginald Vicat Cole paints a broad expanse of meadow, covered with scarlet poppies, in his own way. We cannot award the highest praise to T. B. Kennington's classical legend, "Cephalus and Procris," an adaptation of another subject. The charming recumbent nymph, with her wealth of golden tresses, lies wounded, while her admirer is prostrate at her side. Miss Flora Reid has done nothing stronger or more brilliant than "Cock-a-Doodle-do!" (70); the deep blues and spring greens are, as usual, refreshing and vivid. A pleasing study of "Canterbury," by Vincent P. Yglesias (69), is hung. Solomon J. Solomon sends an idealised study entitled "Gabrielle" (77), a fair girl with large, light-blue eyes and long tresses. The purple drapery makes a somewhat trying contrast to the pallid face. Leopold Rivers has one of his quiet evening effects, with its

stillness and silhouetted profile of cottages against a light sky (78). In composition and colour there is merit in W. H. Bartlett's "Difference of Opinion" (81): a party of billiard players in an inn, who are having an altercation, while at the side are seated a few who are freely criticising and drinking. James Orrock has a finely-painted example of his work, "The Estuary of the Nith" (84), broadly and solidly painted. "The Sirens' Pool" (105) is a favourite theme for certain impressionists. Julius Olsson paints a bay of delightful blue sea inclosed by rocks, lit up by a summer's sun. The sirens are disporting themselves under a steep rock of rosy light, and alluring the unwary navigator to a spot in which submerged reefs abound. The large subject-picture, by S. E. Waller, "Keep my Secret" (111), must be taken with the reserve that they are portraits of lady and horse. A young lady in riding costume stands at the head of her favourite horse, and is showing him a letter in confidence, which the equine instinct seems to understand. The expression in the horse's eyes is skilfully painted; but the landscape is somewhat tame, and there is a want of vigour in the foreground.

The president, Sir James Linton, contributes only one subject in the Central Gallery—"Rest." The disconsolate maiden, seated against the trunk of a tree on the wooded bank of a river, with a large copper vessel at her side, is rather meaningless, if not an idealistic study. The red-cloaked maiden may be a scholarly study of the draped figure; but what connection there is between the refined-featured lady and the environment does not appear. There is little relation of the figure to the picture. The landscape is in dull green, the bright-red cloak being the only enlivening note. Near are a few meritorious studies. James S. Hill has a very broad and able sketch of "High-street, Glaisdale" (247), a hilly street, drawn with skill; Walter Osborne, R.H.A., "A Connemara Village" (242). The gleam of sunlight over hills gives life and beauty to the broad, quiet tones of the shaded village. The strong work by Robert W. Allan (244), and the study by Ernest Parton (248), Frank Spence-Spenlove's sombre landscape "A Winter's Tale"; and Arthur G. Bell's market study (249), a delightful piece of colour are worth attention. "La Cigale," by Arthur Hacker, is full of tenderness and feeling—a wan-faced girl leaning against a tree, a red rose in her hair, unpretentious, but pathetic in its simplicity. R. Thorne Waite's "Cart-Horses" (259) are well grouped, and the colour rich. John Lomax knows how to hit off an incident. His "Fortune's Favourite" is a clever and spirited group of dice-players.

We can only notice a few in the East Gallery. "Night Thoughts" is a successful ideal by a master of poetic subjects, Henry J. Stock. The figure gazing into a dark, starlit sky is graceful. One of the chief attractions is "A Study," by George F. Watts, R.A., probably an early work by that eminent living master. Considerable beauty of line and colour is manifested in this three-quarter study of a lady's face, ruddy and plump, but full of grace and rich in the harmony of reds. Another master of composition and colour whose works lend a charm to the collection is H. Fantin-Latour. We have spoken of his flower study. Here we have "Diana," a graceful, recumbent figure of the goddess of hunting reposing on a bank and beneath luxuriant trees. A large centre subject by Henry J. Stock, "The Humiliation" of our Lord, is one of the finest works in the room. The hideous monsters whose faces peer from the dark background at the Saviour bear the Psalmist's interpretation: "Fat bulls of Basan close me in on every side; they gape upon me."

Edwin Hayes's large centre seascape (351) and Robert W. Allan's "Starting for the

Herring Fishery," a large picture full of fishing-boats, are both noteworthy; the latter is brilliant in the sea sparkle of the flickering sunlight. We cannot admire T. B. Kennington's "Circe"; there is nothing very bewitching or weirdly fascinating in the fair maiden holding a large glass bowl of red wine, and the treatment is too realistic. Miss McCrossan's "Blue and White, St. Ives," a small study of blue sea and glistening white boats, is a clever piece of colour and drawing. A poetical study, "The Sea People," by St. George Hare, is better in idea than in treatment. Yeend King's "Meadow Sweet" is pretty, and suggestive of spring; the girls on the bank picking the flowers are gracefully drawn, but there is a conventionality which the painter cannot overcome. A bold figure-composition occupies one end of the gallery, representing a group of figures in semi-Classical dress in a landscape. There is vigour of handling and some dignity and grace in the figures on the banks of the pool. John R. Reid's "A Daughter of the Soil" (398) is his best work, a healthy-looking lass who has a hoe in her hand in a field, breezy and brilliant, and strong in colour. The subject is a pleasing departure from the sea toilers and Cornish coast subjects. Alfred Wither's "The White Mill" (377), and No. 395, are strong and vigorous in tone, and we must note works by Lance Calkin (356), Rupert C. W. Bunny (168) "An Allegory," J. Haynes-Williams (364), Fred. G. Cotman's large sunset landscape with Wells Cathedral (323), Adolph Meyer's fine landscape (313), Frank Dillon's Portico of the Temple of Iris at Philæ (298), and John Fulleylove's view of the Parthenon.

THE LONDON COUNTY COUNCIL WORKS DEPARTMENT.

THE Finance Committee of the London County Council, to whom, since the abolition of the Works Committee, the duty has been delegated of controlling the finances of the Works Department, have just issued a report, which contains a statement showing (1) the estimated and actual cost of works executed during the half-year ended March 31, 1897, and (2) the totals of the actual cost and of the final estimates, or the amount of the schedule value, of all works executed by the Works Department since its creation. In all, 13 estimated works have been completed and reported during the half-year. The total of the original estimate for these works was £23,525, the final estimate being £24,099, and the actual cost £25,563, showing a balance of cost above estimate of £1,463. The loss on the half-year has been solely occasioned by the work on the extension of the Wandle branch sewer, for which the final estimate was £9,665, and the actual cost has been £12,011, or a balance of cost above estimate of £2,006. There is a slight excess in cost over estimate in two or three of the other items, but there has been considerable saving on some of the works. This has been the case particularly in the work done for the Housing of the Working Classes Committee. The central laundry in the Boundary-street area, which was estimated to cost £6,532, has been constructed for £6,103, showing a saving of £429, whilst on the construction of a sewer on the same estate, estimated to cost £1,454, a saving of over £300 has been effected. Small works executed for the Fire Brigade Committee have also been carried below the estimated cost.

The table detailing the cost of jobbing works carried out during the half-year by the department for the different committees of the council gives the schedule value of the works as £16,758 and the actual cost as £15,869, showing a balance of cost below schedule value of £889. The value of the jobbing work done for the bridges committee was put at £2,443 and the actual cost was £2,185, for the fire brigade committee £2,877 and the actual cost £2,772, for the main drainage committee £6,670 and the actual cost £6,300, and for the highways committee £1,354 and the actual cost £1,284.

Another table exhibits the totals of the actual cost and of the final estimates, or the amount of the schedule value, of all works executed by the

A PRESENT FOR THE TSAR.

Works Department since its creation. This shows that up to March 31 of this year the final estimate for all the estimated works carried out by the department was £459,772 and the actual cost £462,897, making a balance of cost above estimate of £3,125. The schedule value of jobbing works executed from April, 1895, when the system of a schedule of prices was first tried; to March 31, 1897, was £56,176, and the actual cost £52,260, showing a balance of cost below schedule value of £3,915.

A PRESENT FOR THE TSAR.

NOT "MADE IN GERMANY."

THIS work is the joint gift of the generals of the German Army to the Tsar, through the Kaiser, on the natal anniversary of the late Emperor Frederick III., Oct. 18. It is in the form of a mural tablet to be affixed to the high altar in the Imperial Chapel, in the fortress of SS. Peter and Paul, at St. Petersburg. The full-face portrait of the Tsar is sculptured on the facsimile of the great bell of Moscow, in Carrara marble, the likeness having been modelled at Breslau during the German army manoeuvres in the autumn of 1896. The piece of sculpture, which measures 3 ft. by 2 ft., is attached to a Byzantine bronze shield, engraved with the words "Freundschaft, Immer, unt für Ewig" (friendship, always, and for ever). The clapper of the bell is a copy of the Crown of Germany, and the Muscovite regalia forms the top, with the initials "N." and "W." The rim exhibits the orders of St. Andrew and also the Black Eagle, and bears the inscription "Berlin—Moscow, 1813-1897, in lasting memory of the Napoleonic devastation."

Mr. Oscar Alex. Young, of Elgin-terrace, W., was the sculptor intrusted with the work, and it is worth noting that, though a present from Germans, it was not "made in Germany."

A HISTORY OF RENAISSANCE ARCHITECTURE IN ENGLAND.*

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE two handsome and copiously illustrated volumes which Messrs. Bell and Sons have just published, from the capable pen and facile pencil of Mr. Reginald T. Blomfield, M.A., may at once be described as a distinctly valuable addition to any architect's library, and, at the same time, the work is not in any way so exclusively technical as to insure only a qualified welcome by a large number of readers among that immense class of artistic people who love old English houses, and are more or less acquainted with the history of our national architecture. The author has realised his aim by giving, without controversy, a concise consecutive account of the rise, development, and ultimate decay of what he calls the Humanist revival of the 15th and 16th centuries, as illustrated by the architecture of the Renaissance, in which England happens to be exceedingly rich, not forgetting, of course, the work of the 18th-century architects—such as Archer, James Campbell, Ripley, Lord Burlington, Leoni, Kent, Gibbs, the Woods (of Bath), the Dances, and the Brothers Adam. Three hundred years, 1500 to 1800, forms the period which Mr. Blomfield includes in his history, and

* A History of Renaissance Architecture in England, 1500-1800. By REGINALD BLOMFIELD, M.A., Architect. London: George Bell and Sons, Covent Garden. Two vols. Net price £2 10s.

to make his treatment the more thorough, after analysing the house-planning of the Tudors, the Stuarts, and the Commonwealth, as well as that of Queen Anne and the Georges, he supplies a capital account of the literature of architecture of the 17th and 18th centuries. Added to this follows a treatise on the handicrafts and trades associated with building, thus furnishing much interesting information about carpentry, masonry, brickwork, plaster-work, lead, and iron. A list of authorities consulted is prefixed to the first volume in a useful way for the reader's information, and shows that the author has realised and readily acknowledges what other workers in the same direction have done, thereby, too, making it more evident that Mr. Blomfield's undertaking has not been lightly entered upon. He has given his treatment of the subject a distinct individuality; his drawings are correct, spirited, and detailed, always bright and appreciative, while his writing is entertaining, comprehensive, and seldom over-dogmatic. These are words of no faint praise. It is always so easy to find fault; but then the author tells us that he has not attempted a catalogue raisonné of English architecture during 300 years, and if, may be, some first-rate and typical examples are omitted, he has confined his selection, he says, to buildings of historical importance, or, at any rate, to those which best illustrate, in his judgment, the lines of development of English architecture of the time. There is no need to compare the books before us with the monumental folios produced a few years ago by Mr. Batsford, under the direction of Messrs. J. Alfred Gough, F.S.A., and Talbot Brown, because, instead of contrasting or competing, each of the two works serves to augment the value of the other, and the same remark equally applies to Messrs. Belcher and Macartney's work the "Later Renaissance" now in progress of publication.

Mr. Blomfield very interestingly discourses on the works of the Italians in England employed by Wolsey and Henry VIII., and he accompanies his essay with sketches, such as the terracotta plaque from Hampton Court, which we have reproduced herewith. The influence on the vernacular work of the period exercised by these Italians was very limited, for, of all the Northern peoples, the English were the most tenacious of the past, the slowest to accept these foreign ways. The population of the Metropolis and the principal seaport towns were, no doubt, made more familiar with Continental modes and manners, owing to our commercial relations with the Italian States, which had existed since the 13th century; but the middle and lower classes were separated in a very marked degree by their general poverty and inaccessibility of ideas from the nobility, and so it was that the endeavours of the rich to import in a ready-made fashion a taste for the Renaissance of Europe proved abortive in England, and isolated instances only of their productions exist, such as those at Hampton Court, Layer Marney, the Fitz-Alan Chapel at Arundel, East Barsham Hall, the Abbots Hospital, Guildford, and perhaps the front at Cranborne, in Dorsetshire. Other examples, not named by the author, are the tomb at Wymondham, and Oxburgh Hall and monument in the Church hard by, which certainly deserve a reference. These Italians, Torrigiano and Antonio di Piergiorgio di Lorenzo, Toto del Nunziata and Jacopo da Verona, his associates, Baccio Bandinelli, Benedetto da Rovezzano, Giovanni da Majano, and the rest flourished during the prosperous days of their wealthy patrons; but, subsequently, they suffered many hardships, and did not always, by any means, obtain their dues. These foreigners were familiar with the work of the Della Robbias, and introduced terracotta invetriata—that is, terracotta covered with a stanniferous glaze and susceptible of receiving colour at will. Half the charm of this 16th-century detail in clayware is, however, largely due to its disintegration, and where the old terracotta remains perfect and unsoftened by the action of the weather, it is quite as unpleasantly hard as modern work, though, of course, being more limited in its use, the cast-iron appearance, so isolated from good taste, which we deplore in the contemporary use of terracotta, is for the most part absent in old work. The continued employment of the material was abandoned, with good reason, as being harsh and discordant with the beautiful texture of old English brickwork. The history of the Cardinal's tomb, which Henry VIII. appropriated character-

istically for himself, is highly interesting, and Mr. Blomfield furnishes many items of information about these Italian artists who were employed upon it and their work. The gateway at Montacute House, the choir-screen at Winchester, and the Salisbury Chantry at Christ Church, Hants, are also illustrated.

"The death of Henry VIII. marks a turning point in English history. The end of his despotism was an end of a long nightmare." The Italians retired from this country, the people recovered liberty, and the buildings became marked by a more substantial form of architecture. The numerous foreigners who came to England during the reigns of Elizabeth and James I. were nearly all natives of Germany and the Low Countries. Little work was done architecturally during the days of Edward VI., who was poor, and of Mary, whose reign was marked by other undertakings. The revival of building when it came was associated with German and Flemish artificers. The architect, as we now know him, had not yet detached himself in England as an independent designer from the general body of craftsmen, and usually the building owner or "client," to use the modern term, gave personal and general directions as to what was to be done. The trades with whom rough contracts were made supplied the details, sometimes under a foreman designer, who worked for the most part without drawings and specifications beyond the merest outlines. A long, entertaining chapter is devoted to the history of this exceedingly rich and important period of which we are speaking, and during which the best of our old English mansions were built. The English builders, such as John Thorpe, are not overlooked, and much of the ground covered by Mr. Gotch in his account of "The Buildings of Sir Thomas Tresham in Northamptonshire" necessarily is retraversed; and associated with this connection come the buildings of Robert Smithson, the designer, perhaps, of Wollaton in Nottinghamshire. Bolsover Castle, Derbyshire; Cobham College, Kent; St. John's College, Cambridge, and Corsham Almshouses likewise furnish some good illustrations, and, added to them, are a variety of plans, reproduced from the Soane collection in Lincoln's Inn-fields. The staircases in Whitecross-street, Christ College, Cambridge, and that from Hawkhurst, Kent, which we illustrate in a reduced form with this notice, will give the reader an idea of the thoroughness with which the author has dealt with his subject.

A whole chapter is devoted to Inigo Jones, and not a few of his drawings are reproduced, including the plans for Whitehall, and other "up-rights" figure of St. Paul's, Covent-garden, and Somerset House. The central bay to the south front of Wilton House, herewith photographed from Mr. Blomfield's sketch, is spiritedly drawn, and Wilton is a particularly valuable example, inasmuch as parts of it, at any rate, are undoubtedly by Inigo Jones. John Webb, Marsh, and Gebbier follow with contemporary works at Burford Priory, Oxfordshire; St. John's Church, Leeds, and Groombridge Church, Kent; the Ashmolean Museum, Oxford, and Trinity College Chapel there, Emmanuel College, Cambridge, and other examples. Sir Christopher Wren and his works are done justice to with copious plates and plans of his scheme for the rebuilding of London. We reprint one of the plates in this section, giving it to a smaller scale. The subject is the font of St. Stephen's, Walbrook. Grinling Gibbons's design for the enrichment of a monument by Wren shows the style of our great national architect's drawings. Wren's contemporaries and successors are treated of in the second volume, from which book we take our remaining illustrations. Our space is exhausted, but our interest is only quickened as we close our review of these two excellent volumes, which thus obtain our warmest praise. By no means the least valuable parts of Mr. Blomfield's work are his practical pages on brickwork, plaster-work, lead, and iron. No architect can read them without advantage.

THE DWELLING-HOUSE.*

THE little volume before us is a useful protest against the curse of overcrowding. Its author, Dr. Poore, is a zealous advocate in the cause of sanitary progress, and his "Essay on Rural Hygiene," and lectures on the baneful effect of overcrowded areas, have

shown how much can be done to improve our habitable conditions. In this volume the author points out the defects in our dwelling-houses, the danger of persons being located under the same roof with a "case of whooping-cough, measles, scarlatina, diphtheria, typhus, or small-pox." Even tuberculosis and pneumonia are now placed in the same category of communicable diseases that are liable to infect through the air. The requirements of independent ventilation and light to all channels of internal communication, such as halls, passages, and staircases, are pointed out. These should be blown out by through-draughts and be well lighted. The author says, "The dark passage ending in a close *coul de sac* of bedroom doors is one of the commonest features of the modern house, and is absolutely to be condemned." Again, "The smell of fried bacon which oozes through the keyhole of your bedroom may be accompanied by all the infective potentialities of all the inmates of the house." In fact, the internal staircase serves rather for the conveyance of foul air instead of the supply of fresh air. Large hotels and towers of flats are liable to be most unwholesome residences. Lift-shafts, as well as staircases, should be ventilated. A typical London house is shown which illustrates the defects common to it, and the alterations necessary to make it healthful. The plans of every floor (four stories above basement) are given. Its height entails labour on the servants, and the tendency to build them higher is shown to be most disastrous to health in our great cities. The author criticises each of the floors of these typical London houses, and especially the basement, where the butler sleeps, and where the traps and closets abound, the one staircase which acts as a ventilating shaft, into which all the basement fumes and smells enter, and which has no outlet but the bedrooms. Useful suggestions are made on the ventilation of corridors, which the Medical Committee has drawn up for the guidance of the architect in the plans for the rebuilding of University College Hospital. One is to place the secondary staircase between the ward and the sanitary offices, so that the staircase forms a cut-off, with cross ventilation. The author would make the staircase useful in this way by cutting off connection with the offices from the living rooms of a house, a plan that is often followed where there is area enough as in a country house. We have no space to follow the author into other points, such as aspect, warming, hotel bedrooms, sanitation of isolated dwellings, dry methods of treating urine, wells, &c. The remarks on town dwellings, building estates, model by-laws, overcrowding statistics, contain many suggestions of value. If some of these suggestions had been carried out at Maidstone a number of cases would have escaped the terrible epidemic now running its course.

NOTES ON SURVEYING AND LEVELLING.—III.*

By WALTER TESTER.

SETTING OUT THE TOWER BUILDINGS.

THE survey of the site having been plotted as described in the last article, and a block-plan showing the position of the various buildings, made with the assistance of the levels and sections taken as explained, the surveyor is required to set out on the ground a building of the shape shown on Fig. 1—viz., an octagon with four wings off alternate sides. The building is to be used as a place of public amusement, and contains in the lower portion inside the octagon a combined circus and water show, with the necessary dressing rooms and accessories in the basement.

Two of the wings are devoted to entrances and staircases; another is to be used for dining and refreshment rooms, and the fourth is to contain all the machinery. There is to be a steel tower, about 550ft. high, octagonal on plan, the main pillars of which come down just inside the octagon. The position in which this building is to be placed is on the site of the old kitchen garden, and the surveyor is supplied with a plan showing the situation provisionally adopted, also with the general dimensions of the buildings. The diameter of the octagon being:—

	154ft. 0in. inside
Add 2 8½	thickness of wall
Add 2 8½	thickness of wall
159 5	outside diameter

Then, by calculation—

$$\text{Length of the side} = \frac{1}{2} \text{ diam.} \times \cdot 8284 \\ = 79' 8\frac{1}{2}" \times \cdot 8284 = 66' 0\frac{1}{2}"$$

$$\text{Length of line from centre point to corner of}$$

$$\text{the octagon} = \sqrt{79' 8\frac{1}{2}"^2 + 33' 0\frac{1}{2}"^2} = 86' 3\frac{1}{2}"$$

$$\text{Wings 65ft.} \times 40\text{ft. 8in. external dimensions.}$$

$$\text{Diagonal of wings} = \sqrt{65' 0\frac{1}{2}"^2 + 40' 8\frac{1}{2}"^2} = 76' 8"$$

Supplied with these particulars, the surveyor can proceed to set out the building approximately on the ground, which may be done near enough for present purposes by scaling measurements from any fixed points on the site plan to the main corners of the proposed building, and setting out these dimensions on the ground. The surveyor will then get an idea how the building is going to work in, and whether it will necessitate any further cutting down of trees, and he should take trial levels of the ground at each of the main corners of the building to see how the excavations for the basement will come out. He may, perhaps, have to move the building down the hill to prevent cutting through a very high bank on the top side of the site, and, if so, he must set the buildings out again, and take a new set of trial levels. In fact, it may be necessary to alter the position several times before it is satisfactory in every respect. Before it can be definitely fixed, trial-holes should be made to see at what depth there is a good foundation for the walls and tower pillars, and levels, both on the original ground and on the rock, should be taken at the corners of the building.

The plan (Fig. 1) shows the position finally adopted, and the following are the levels, above Ordnance datum, at the main corners.

Points.	Original Ground Level.	Surface of Rock.
A	51' 60	45' 21
J	5' 26	—
K	53' 55	—
B	54' 00	43' 55
C	61' 92	52' 75
L	60' 89	—
M	73' 79	—
D	67' 18	58' 18
E	69' 04	59' 13
N	74' 79	—
O	69' 93	—
F	62' 88	55' 74
G	54' 64	49' 55
P	50' 56	—
Q	50' 72	—
H	51' 78	44' 23

The level for the basement floor of the building being 50' 00 finished, and the whole of the ground inside the octagon and for the two wings G H P Q and A B J K is to be excavated down to the 49' 62 level (allowing 4½ in. for concrete); in addition, the arena in the centre of the octagon and the tower pillar foundations are to be sunk to a lower level still. The ground floor of the building is to be at 60' 00, and in order to reduce the excavation for the road around the buildings, the level opposite the entrance wing E F N O is raised to 70' 00 (necessitating a flight of steps in the building down to the 60' 00 level).

The position of the building and the level of the main floor being settled, it is desirable to fix permanently the centre point of the octagon and the axis of the building. The best way to deal with the centre point is to dig out a hole down on to the rock and then put in a wooden post, say, 4in. by 4in., which should be carefully fixed, plumb, and then built around with brickwork to keep it in position, a nail being driven into the post at the exact position of the centre point. As the excavation is got out this centre post can be sawn off, the brickwork being removed and the point transferred down to a lower level. An easy way to do the latter is to fix four pegs with their tops about level, and drive a nail in each so that two string lines fixed to the nails will cross each other at the centre point, the lines being arranged so as to cut each other about at right angles and not obliquely. The four pegs are fixed so as to be clear of the centre pier, it being understood that the original ground around the centre point is not disturbed until the latter is transferred to a lower level. The brickwork around the centre post can now be removed, and the centre point plumb down.

We will suppose the surveyor has fixed his centre point as described; he must also permanently mark the axis of the building. Of course, he has already done so approximately, and he should now set his theodolite over the centre point and straighten this line up by turning over the telescope of the instrument, checking the adjustment by setting round an angle of 180°. The axis of the building should be retained by driving two posts into the ground

* By GEORGE VIVIAN POORE, M.D., F.R.C.P., Physician to University College Hospital, &c. Illustrated. London: Longmans, Green, and Co.

FIG. 1.

entirely clear of the excavations, one on each side of the centre point, and marking the exact points where the line cuts with a nail accurately set with the theodolite. The surveyor should now reset out the outline of the building as accurately as he can with his chain and tape, and must proceed at once to take the sections for the measurement of the excavations before the ground is disturbed.

In addition to the building, there is a circular road to be made around the latter, and he must make his sections serve for same; and the question now arises, Which are the best lines to use? They must be characteristic sections of the ground, and for this purpose the direction of the arrows (Fig. 1) is the best; also they must take the shape of the building and road into consideration. So far as the octagon is concerned, a series of lines parallel to the sides, as shown on Fig. 1, will do very well, as they are typical sections of the ground. These lines would not be suitable for taking the wing excavations, as they cross them obliquely. It therefore seems desirable to turn the lines at right angles to the sides of the octagon where the wings are. (Fig. 1).

For the circular road and spaces between the wings outside the octagon, the lines already arranged will serve if produced, and similar ones

square off the two remaining sides of the octagon will be required. This arrangement leaves triangular pieces of ground unsectioned, and it will be as well to run a radial line from the centre point through each corner of the octagon.

These sections should be taken as close together as the nature of the ground requires, or, as is often the case, as time will permit. The method of setting out the lines is exceedingly simple, the outline of the building being already marked out; all that is necessary is to measure out the positions where the sections cut, and sight the lines through from opposite sides of the octagon (see Fig. 1). So far as the radial sections are concerned, the lines can be marked out by setting the theodolite at the centre point, and turning on to the octagon corners, and marking another point farther from the centre on the same lines. The road sections require to be run well out, so as to take in the natural slope of the bank, and they should have a peg left in at the end, as this will be useful for measuring the top edge of the slope when the road is cut through. The order of taking these sections would, if necessary, be arranged so that the excavator could make a start immediately one or two are obtained, and by the time they are all taken he will have got well to work excavating the sand on top of the rock on the high side of

the ground and running it out to the low side, leaving it at a convenient level for filling up around the building. It will not be necessary to take the sections outside the outline of the building on the low side of the site, as there is no cutting, and the price for excavation includes tipping up this portion of the ground. A good long stake should be driven in at each main corner of the building, as any short peg would soon be lost in loose sand excavations. As the excavator gets the sand removed and the rock bared, the surveyor must reset out the outline of the building and take rock sections on the same lines as used for the ground surface. The excavator can then proceed to get out the rock down to the formation level for the basement floor. On the lower side of the site there is only the top soil to remove, but as the walls have to go down on to the rock, trenches must be cut for them, and these require to be set out. The trenches are made a few inches wider than the wall, for play, and the walls are to be built without footings, as they start off the rock. The object of the footings being to distribute the weight over the foundation, they are unnecessary in this case. Where the walls start off the rock at the formation level, they should have a trench about two courses deep for them to prevent any tendency to slide.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXX.

SOME of the principal joints employed in the building up of the elementary members of structures having been illustrated, we have now to consider the methods of effecting joints

Fig. 186.

between the members themselves. This is not always an easy matter, because strength, stiffness, and the economical employment of material and labour have to be taken due account of; frequently, too, convenience of transit has to be provided for, more especially in work sent to foreign countries, the resources of which are but partially developed, and in hilly districts.

Fig. 187.

Rivets and bolts are both used in joint-connections for permanent fastenings, but bolts are often inserted in rivet holes for temporary service, to be subsequently replaced by rivets. Plates, bars, and rolled sections are used for connecting pieces, and built-up gussets and brackets and forged knees also for many purposes.

Fig. 188.

The whole question of the fitting of parts together is of great importance as affecting the stability of a structure, and one in respect of which specifications and inspection are far more stringent than formerly; it is here that much of the difference in the cost of contract work lies, and that the necessity for the strictest inspection comes in. The reason is clear. If joints do not

abut closely because of bad, unequal fitting, or of no fitting at all, the strains are thrown mostly upon the rivets or bolts; they become not only subject to severe shearing stress, but also to alternating stresses, the most trying to which they can be put, due to the rickety character of the fitting. The only element in the work which can serve to prevent this from happening is the frictional contact set up between surfaces by reason of the clinching of the rivets or bolts, and little or no dependence is placed upon this coming into play when required. The tendency

Fig. 189.

to slip with bad joints and ill-fitting rivets must always be taken account of, and frictional contact must not enter into calculations of strength. A few remarks on the general modern practice in this respect may suitably precede the illustration of joints to follow.

Since bridge, girder, and roof-work have generally to be erected in a works, and sent away in sections for erection in other places—sections can never be very large. For some foreign countries, in which the difficulties of transport by men or animals alone is great, it is often stipulated that the weight of any one section shall not exceed a given amount. Several results follow.

The joints of the section must not be riveted up

Fig. 190.

in the contractor's yard, but only bolted temporarily; the joints must be made with reference to the design and strength of the members. In the construction of the main elements themselves they can only be made at portions where the plates or angles break joint in the design, so that limitations other than those of manufactured lengths available will occur in such cases. When testing a piece of work in the contractor's yard the deflection will usually be greater when temporary bolts alone are used than when the rivets are put in, and allowance must be made for

Fig. 191.

this by the inspector. The writer remembers an angle-iron in a very vital portion of a structure once breaking when under test, due entirely to the fact that it was bolted instead of riveted, and that every rivet-hole had not been fitted with a bolt, but some with bolts, others with drifts only. Another matter is, that work sent abroad in sec-

tions must have some bold, distinctive mark, corresponding with a mark on the section adjacent as a guide to the work of erection. In braced structures there are so many portions exactly alike that, without such marks, the putting a piece of work together as it went together in the contractor's yard would be a tantalising job. The methods of marking generally adopted is that of letters and figures, as A 1, A 2, &c., up to 50 or 100, when B begins, and so on. More than this, it is necessary in massive work to have some further distinction more readily apparent, in order to effect the preliminary sorting out of the sections on their arrival at their destination; thus, in

Fig. 192.

the case of a bridge, different shades of colour would be used for different spans, or for the girders for one side of the spans different from that used on the girders of the other side. In the latter case all the cross-girders would properly be painted two colours, one-half to correspond with the colour of the side to which that portion is attached, the other half painted to correspond with the colour of the side next which that colour goes. It is easy to paint this while the work remains in the contractor's yard, and it permits of the parts being all assembled without much supervision on reaching its destination.

In girder, bridge, and roof work, in which a very large number of similar pieces are required, a most important factor, both in economical and

Fig. 193.

in accurate results, is the system of templating—that is, no bars or sections are marked off by hand, no holes are marked out with compasses, no bevels are marked with the bevel, nothing, in fact, is left to be done by rule and compass, or by eye measurement; but templets are made by which the absolute uniformity of a hundred or a thousand similar pieces is insured without any marking off by rule and compass. A very great deal might be profitably written about the details of this system, but a summary only of the methods employed is consonant with the scope of this series.

There are two materials used for templets—wood and sheet iron. The first is employed largely because it is cheap, and is, indeed, quite

serviceable enough for many jobs; but iron is better for large contracts because it stands better, while wood is liable to go out of truth in a short time. The larger the templet the more reason is there for making it in iron; the weight for handling about need not be increased unduly, because lightening holes can be punched or the metal may be thin. Templets in wood are generally from $\frac{1}{2}$ in. to $\frac{3}{4}$ in. thick, of yellow pine, free from knots and shakes, and straight in the grain; those in wrought iron are from $\frac{1}{8}$ in. to $\frac{1}{4}$ in. thick. Holes

Fig. 194.

are drilled in the templets in the positions which the rivet holes are to occupy in the bars or plates or joint pieces; and edges, and ends are cut to the precise dimensions and shapes in which the work is wanted. Large templets for plates are framed, being open in the centre; templets for joists, struts, ties, angles, tees, are generally in a single width. Every templet is stamped with the number of pieces wanted, with the order

Fig. 195.

number of the job, and with any other particulars which facilitate the carrying out of the system of the shop. They are not destroyed when done with, but kept for reference, or for replacements, or duplicate orders, being generally placed in a stores or hung up against the walls of the shop or shed.

It is usual to lay the templet upon its job, and mark off edges and holes with a scribe on the surface of the bar or plate; if the holes are numerous, and often when not so, the surface of a plate, bar, angle, or tee is whitened over in order to show up the lines clearly. When holes

Fig. 196.

are drilled and not punched they are generally drilled directly through the templet, which is then clamped upon the work.

When planed joints are specified, that does not mean that the ends of angles, tees, bars, and other sections must necessarily be done in a planing-machine. They may be so done; but, if cut off truly with a cold iron saw, the result is equivalent to a planed joint. The saw cuts slowly, but more rapidly than a planer tool. Work can easily be set upon the saw-table to be cut square, or to any angle required, and one cut through of the saw leaves the ends perfectly true and smooth.

Channel-irons can be sawn in the same way. The edges of plates must, of course, be planed; but these are generally superimposed, so that several ends are operated on at once. As long ago as in the early '70's, the best girder-work was put together with planed joints and drilled holes; the use of iron templets, multiple drilling-machines, and cold iron saws was practised even then in the best firms; this is more than can be said for much rough work even to-day. No shorn edges nor punched holes were permitted on the bridge work of the Manchester Ship Canal, nor are they allowed in any great contracts.

Nothing looks much worse in plated work than overlapping ends and edges, and most inspectors are particular on this point, and will often insist on projecting edges being chipped off level; there are some curved edges in which overlapping becomes unavoidable, but, in most cases, overlapping need not occur if edges are planed or sawn, and rivet-holes punched or drilled accurately. When a number of plates for the top and bottom flanges of girders are to be riveted together, the edges should all be planed first and the rivet-holes drilled in place. The ends of built-up members do not often come flush when they are planed or sawn first by templet and riveted afterwards. The best method of obtaining absolutely flush ends in such a case is to shear the ends roughly, within from $\frac{1}{2}$ in. to 1 in. first, then, after the parts are riveted up, to saw the ends off at once with a cold iron saw; this is easily done, and takes no more time; as a rule, less than attempting to cut every part to exact length at first. The value of this method is more apparent in the case of bevelled than of square ends. It is a troublesome job to match a number of pieces, plates, strips, and angles in respect both of length and bevel, but this can be readily secured if the ends are sawn finally.

Coverings for joists are varied to suit the nature of the work which has to be connected; the simplest is a plain plate, next come tee-irons and angles. Plates and tee-irons are mostly used to fish plain plates together at the joints; angles are sometimes employed for the same purpose, but mostly for covering the joints of angles. Illustrations of these have been already given.

Angles are used largely to connect pieces of work at right angles, but there are limitations to their employment. If the leverage on a joint is great, and no reinforcement or other support is available, then the angle is not sufficient, but a gusset or gusset brackets must be used; if, however, a joint is held by other joints, as, for instance, a framing which is held rigidly against cross or diagonal movements, then the angle-joint alone is sufficient. There is evidently as much diversity in the forms of joints as in the elements of structures themselves. A few selected examples may now be offered.

Joints between common joists at right angles, Fig. 186, are made by means of angles riveted to both joints; the abutting joists are fitted tightly between the flanges of the transverse joist, and the angles need not fit at top and bottom, but will clear the throat of the joists, as shown; the number and spacing of the rivets will depend on the depth of the section. If the section is so shallow that only one rivet can be got into the depth, then angles with wide flanges must be used, in order to get two rivets into the breadth of flange, Fig. 187.

Instead of fitting the abutting joist closely between the other, as in Fig. 186, a method which requires fitting with chisel and file, or cutting on a planing or shaping machine, the joist is often joggled or set on the bottom edge A, Fig. 188, by

the smith, and the top edge B is not fitted closely. When the abutting joist is shallower than the other, say, to the line *a*, the bottom edge is fitted by either method, or sometimes it is made simply to rest upon the bottom flange, as at C, without shouldering. When a shallow joist is fitted to another, the top edges being flush, support is rendered to the trimmer-joist by means of an angle riveted to the main one, as shown in Fig. 189. Fig. 190 shows shallow joists united to a deeper one, midway, with a pair of angles, and no support beyond that afforded by bolts. The union of channels would be similar to that of joists.

The union of joists and channels offers less difficulty than that of most other sections, because a better abutment can be secured in the first than in the second cases; in angles and tees, for example, an abutting flange must stop short at the flange of the principal member, while the web of one must pass on to the web of the other. In the union of angles a central web generally occurs to render necessary also packing plates. Fig. 191 shows the abutment of two members, A, B, built thus against a similar central member, C. The web-plates and the vertical flanges of the angles pass on to the vertical flanges of the angles in C, the web-thickness being filled up with packings; the

Fig. 197.

horizontal flanges of A and B stop at the edges of the angles in C, and the whole are connected with angles or with forged knees, as shown, riveted together.

Fig. 192 illustrates the attachment of angle-irons to a main member at different angles by means of brackets of wrought iron bent to the shapes required and suitably riveted. Fig. 193 illustrates the attachment of two angles to a main member by bending without cutting abutting portions; the union could be effected without any joint pieces, but the rivet-holes would weaken the angles and the joint plates shown reinforce the weakened angles.

The union of built-up girders is effected in very many ways. Fig. 194 illustrates the jointing at right angles of a rolled joist A on a girder B, A is a roof rafter, and B a purlin. The top and bottom members of B are formed of angles, placed back to back, with a space between to take the ends of the bracing. The bracing consists of channel irons, the flanges of which are cut away next the ends, in order to allow of the web passing between the top and bottom angles, between which the bracing is riveted; the bracings are united at the centre, where they cross, with a rivet. The strut consists of two strips of tee-iron, fitted outside the top and bottom angles of the purlin, and riveted to one another with distance-pieces or ferrules between. The attachment of the rafter A above is by means of forged brackets *aa* made of plate bent and riveted to the side of the rafter and bolted to the top angles of the purlin. Packing blocks *bb* are inserted between the lower portion of the bracket and the top angles of the purlin, the bolts passing through the packings.

Figs. 195 and 196 show an attachment at right angles of bracing rafters A to the same purlin B; both are of lattice work, and the latter is not so deep as the former. The top and bottom flanges of the rafter are of tee-iron. At the top, the tee-iron A passes over the purlin, and is fastened to the latter with brackets of bent plate. At the bottom the tee-irons (Fig. 195), *A'*, are set to fit over the angles which form the bottom flange of the purlin, and are tied together in place with a

FIG. 193.

cover or joint-plate bolted to the tee and through the flanges. A strut is riveted across the purlin at the point of attachment; it is formed of two tees riveted to one another with distance-pieces between.

Figs. 197 and 198 show a method of attachment of purlins to principals; the top and bottom flanges of both are formed with angles placed at a little distance apart. At the ends of the purlins A A, tee-irons are riveted between its angles; these abut against the bottom angles of the principal, and are bolted to each other with distance-pieces between. The top angles B' are connected with a cover-plate riveted to the angles. The upper portions of the purlins and principal are connected with brackets *a a* formed of bent plates; C shows how a bracket for the attachment of a tie-rod may be made and attached.

J. H.

ROWTON HOUSE, NEWINGTON BUTTS.*

THE subject of our illustrations is the third of a series of "Rowton" houses. The first, situated at Vauxhall, was the outcome of an endeavour upon the part of Lord Rowton to provide accommodation for a large class of men who, for want of buildings of this type, were forced to spend their lives amid the indescribable surroundings of the majority of common lodging-houses, or the isolated and miserable existence of the lodger in a small house already overcrowded. In undertaking this work he was fortunate in obtaining valuable advice and assistance of Sir Richard Farrant, who has for many years been engaged upon large schemes for the artisan class in London and the suburbs. Rowton House, Vauxhall, with its 475 beds, was opened in 1893, and proved an immediate success, encouraged by which, a company was formed, with Lord Rowton as its chairman and Sir Richard Farrant as one of its directors, for the purpose of extending this work in various parts of London. Rowton House, King's Cross-road, was immediately put in hand, with 677 beds, and has proved equally successful, the accounts showing a full house for every night after the first month. The return from these buildings show that, while providing what has been described as a "working-man's hotel," substantially built, and with every consideration for the inmates' comfort, it is possible for the payment by the lodger of 6d. per night to produce a fair return on the capital expended.

The site of Rowton House, Newington Butts, is ideal in many respects; it is in a wide passage-way at right angles to Newington Butts, thereby avoiding the noise of that busy thoroughfare, and has along its entire frontage a large, well laid-out public recreation ground, formerly the site of the church of St. Mary, Newington, and its churchyard. It is in the centre of a most populous and poor neighbourhood, with large numbers of that class who use buildings of this type, and the proximity of the Elephant and Castle, but a few hundred yards, renders it possible for workmen to start from that centre to every part. Externally, the elevations have been built in pressed Leicester brickwork, relieved with mingled gaults and dressings of Mr. J. C. Edwards's pinky-buff terracotta; the brickwork throughout is in Portland cement; the floors are breeze and steel joisting; the roof to front elevation breeze and steel-framed slabs with

green slates nailed direct thereon; other roofs in asphalt on breeze concrete; staircases, which run from bottom to top of building, in Portland cement; floors, where not wood, are cement and granite chippings; all other floors solid oak block, those on ground-floor oak-laid herring-bone. The walls of all rooms and corridors in the basement are ivory-glazed brickwork (excepting in sitting and bedrooms occupied by females employed in the catering department); on the ground-floor all corridors have dado in two tints, and above, to ceiling, in ivory bricks, all glazed work, while in the rooms used by inmates a similar dado is built with plastering above, distempered to a tint, as a ground for the framed engravings that are hung thereon; the staircases, landings, four w.c.'s, and sink space with drinking-water (for night use only) on each floor, are all built in ivory-glazed brickwork; the walls of cubicles are distempered to a terracotta tint. Two staircases, placed at the extreme end of the cubicle floors, give access to cubicles, the disposition of these being governed by the necessity of making it impossible for a lodger to be trapped by fire; and they are so planned that in the event of such an outbreak, a way of retreat is left open in the event of one staircase being blocked; at the top of building a railed-in footway is carried from one staircase to another, to complete this portion of the scheme, across the flat asphalt back roofs. Each floor is subdivided by divisional walls to check, if not stop, the horizontal spread of fire, and, in addition, to facilitate isolation and efficient fumigation in the event of a case of contagious disease. Five points, fitted up with fire-hose, are provided on each floor. The cubicles, 804 in number, are arranged on six floors, and are uniform in size, excepting where breaks in the elevation increase their length, with partitions 7ft. 6in. high between each and 6ft. 6in. high next corridor, leaving a free space to ceiling for purposes of ventilation. The minimum cube space for each lodger on cubicle floors is 427ft., the partitions of cubicles are framed woodwork, painted and varnished, and the flooring is nailed direct to the breeze concrete. Each cubicle has but one single bed in it, fitted with wire-woven mattress, horse-hair mattress and bolster, blankets, sheets, and quilt, and a chair, shelf, clothes' hooks, and utensil are provided. Every cubicle throughout the building has a window under the control of the occupant. Two officials sleep on each floor.

The building has been erected by Rowton Houses, Limited, by their own staff of workmen, from the designs and under the superintendence of their architect, Mr. Harry B. Measures, of 16, Great George-street, Westminster.

A NEW FOLDING TEE-SQUARE.

A TEE-SQUARE with a "shifting stock" is very often a convenience to a draughtsman when engaged in isometrical and perspective drawing. But for engineering and architectural drawings, such as plans, elevations, and sections, distinguishing drawings from pictures, the plain and simple orthographic projection is, and will be always, employed. As a rule, especially in architectural orthographic drawings, the majority of the lines are situated in two planes, the vertical and horizontal, although on the antiquarian or double elephant sheet they are all in the same plane—that is, the plane of the paper itself. Both in drawing and surveying instru-

ments improvements are continually being made, nor does progress stop at mere ameliorations. Frequently the modifications, while retaining to some extent the radical features of the prototype, cause so serious an alteration in it that the inventor or designer himself would be puzzled to recognise his own handiwork or brain work.

In Fig. 1 is represented the new form of tee-square folded up, in which *a* is the pivot or pin upon which the movable arms work,

FIG. 1.

FIG. 2.

b is a mill-headed screw which moves up the vertical slot *c* and actuates the arms, and *d* is the slot provided in what might be called the blade of the square, to allow the arms or the two halves of the stock to work. In Fig. 2 the square is shown unfolded—that is, with the movable arms open, and the millhead screw *b* has been shifted along the slot *c* from *b* to the position indicated by *b1*. Although not shown in the figures, the scale of which is too small for the

FIG. 3.

purpose, the edges of the groove *c* are graduated, so that any angle can be measured or divided, as the case might require, and the result recorded. The screw *b*, in order to obtain this last desideratum, can act as a clamping screw, and so fix the position of the movable arms *K* and *K1* until the value of the angle is duly registered.

It is evident that if the arms be pushed out to

FIG. 4.

an extent which brings them square to the blade, and clamped by the clamping screw in that position, the square may be used as an ordinary T-square, as shown in Fig. 3. But the arms would have to be made a good deal shorter, and some other adjustments introduced, which would

FIG. 5.

rather hamper the instrument when employed for other purposes. Were the arms not capable of being extended beyond the position shown in Fig. 3, which is a diagram pointing out how the square might be applied to an ordinary drawing-board, then no angle could be measured exceeding a right angle. But by pushing the clamping screw as far as the upper extremity of the groove or slot, the arms can be caused to assume the position shown in Fig. 4. It is very

* A double-page view of this building appeared in last week's BUILDING NEWS.

seldom that such very large angles, approaching to 180°, are even needed to be determined, but this little instrument can be used for that purpose, if necessary. It can also be readily made to act as a level, as shown in Fig. 5. All that has to be done is to screw in a temporary plug, *p*, suspend a plumb-line, *S*, from it, and raise one of the movable arms *K* or *K*₁ until the blade of the square is parallel to the plumb-line. The profile of a moulding can be ascertained by a very simple process, and there are numerous other applications of this handy little implement which will suggest themselves to the practical artisan and workman. T. C.

FIREPROOF FLOOR TESTS.

SOME important tests have been made by the New York Building Department, a full description of which, illustrated by diagrams, appears in the *Engineering Record*. The building for the tests are described in detail. The Roebling system of flooring is thus described. The floor-beams are 10in. 25lb. I beams, placed 3ft. 10in. between centres, with a clear span of 15ft. between brick walls, well bolted to 12in. girders, and stiffened by two tie-rods to each bay. They have a safe uniform load as applied to test 263lb. per square foot. The centring of the arches consists of No. 19 four-warp wire cloth, stiffened by means of $\frac{1}{8}$ steel rods, woven into the cloth at intervals of about 9in. This centring was in sheets, and sprung in between the floor-beams in the form of an arch, with the ends of rods abutting against the beams. Over the centring two $\frac{3}{8}$ in. steel rods were laid parallel to beams, and secured to each stiffening rod. Heavy galvanised wire was dropped from every other stiffening-rod, and attached to the wire cloth of the ceiling. The concrete filling over the wire arching covered the top of beams about $\frac{3}{4}$ in., and above this another quality of concrete was laid 2in. thick, in which were bedded the floor sleepers at right angles to floor-beams. The concrete between beams was composed by bulk of 5 parts of cinders, 2 parts sand, 1 part cement, and 1.35 parts water. This construction withstood the severe test of a maximum temperature of 2,300° and a deflection of 4.485in., loaded with 150lb. per square foot over the centre. The concrete and iron beams after the fire test were red-hot, even after water had been played on it. The plaster and wire netting were burned off. The wire netting was completely burned off in the naked arch, but the arches were found in good condition. The concrete arch was unaffected by the fire and water. The beams, after a subsequent loading, were found to have a permanent deflection of 2in. The load applied to produce this result was 600lb. per square foot, applied over the central bay of floor. The Thomson system of flooring and the McCabe floor were also tested, and the results are fully recorded in the logs. The latter stood the test well, though a load of pig iron 600lb. per square foot was evenly distributed over the central arch.

A marble bust of the late Miss Frances Mary Buss was unveiled on Friday at the Camden School for Girls, Prince of Wales's-road, N.W., of which, together with the North London Collegiate School for Girls, she was the founder. The bust was executed by Mr. E. Roscoe-Mullins.

An altogether better class of properties was on offer at the Mart last week, including several landed estates, which, with the exception of one or two of the larger lots, met with a favourable reception. Investments of a more ordinary character were also in good demand, and the prices obtained were generally satisfactory. The aggregate realisation amounted to £133,051, the first time since the close of the summer season that a total running to six figures has been recorded, and an unusually high return for the month of October. Last year only £27,016 was registered in the corresponding period, but that was much below the average.

The members of the sanitary committee of Bristol held a special meeting on Monday for the purpose of electing an assistant engineer and surveyor and two surveyor's assistants, appointments rendered necessary in consequence of the extension of the city boundaries. Mr. W. J. Steel, aged 30, assistant surveyor and water engineer to the urban district council, Tottenham, was appointed assistant engineer and surveyor. For the two posts of surveyor's assistants the choice fell first upon Mr. Ellis McKenzie, 29, of Manchester, and Mr. E. W. Lashmore, 27, chief assistant in the office of the borough engineer, Southampton, secured the second appointment.

OBITUARY.

MR. ROBERT PRICE, of the firm of Furber, Price, and Furber, Warwick-court, Gray's Inn, died on Tuesday in last week. Mr. Price, who was in his eighty-fifth year, claimed to be the oldest practising auctioneer in the kingdom. Sixty years ago he entered the office of Mr. Charles Furber, and for the past 25 years he had been a partner in the firm. It is now more than two years since he appeared in the rostrum, but for many years he enjoyed a great reputation as a "chattel" valuer. The contents of the famous Argyle Rooms and the Surrey and Vauxhall Gardens were sold under his hammer, and there were few men who had had more experience in this class of work. Mr. Price still continued to live over his office, and it was there that he died, after a short illness.

CHIPS.

Mr. Alfred Austin, the Poet Laureate, attended the opening of the new Science and Art School at Ashford on Wednesday in last week.

The citizens of Sheffield, as a token of their appreciation of the Duke of Norfolk's year of office as Lord Mayor, have given a commission to Mr. Onslow Ford, R.A., for a marble statue of the Lord Mayor in his robes of office, to be placed in the new town hall, recently erected from Mr. Mountford's designs.

The complete wing at Blair's College, near Aberdeen, which forms the first instalment of the new seminary intended ultimately to supersede the old structure, was opened on Thursday in last week with full Catholic ceremonial. The building occupies the western portion of the site, and is a plain substantial erection of three stories. The classrooms are on the ground floor, and above are situated the rector's and professor's apartments, while the upper floor consists of the dormitories for the students.

An arbitration is proceeding at Preston, before Mr. D. Watney, to fix the amount of compensation to be paid by the London and North-Western and Lancashire and Yorkshire Railway Companies on the compulsory acquisition by them of property on Fishergate Hill, Preston, belonging to Messrs. Harding, the proprietors of the Preston tramways. The property is required by the railway companies for the purpose of widening the line at the dangerous curve outside Preston railway station, where the Scotch express was wrecked in July of last year.

The tram-lines from Lytham to St. Anne's were, on Tuesday week, inspected on behalf of the Board of Trade. The lines have been laid some time, but owing to the difficulty of procuring a site for the erection of a charging station at the Lytham end, trams have not been run yet, although the length from St. Anne's to Blackpool has been used for several months. The terminus at Lytham is in Clifton-square, and the lines go down Church-road, along the railway at Ansdell, thence along Clifton Drive to St. Anne's, and on to Blackpool.

The German Emperor unveiled, in the Theatre-square at Wiesbaden on Monday, a statue of his father. The Emperor Frederick is represented standing, in the uniform of the Second Cuirassiers, of which his Consort is Honorary Colonel. The statue is of bronze, and is about 12ft. high. The pedestal, which is of granite, is adorned with reliefs, and stands on a raised platform. The sculptor, Herr Uphues, is said to have been assisted in his work by the Empress Frederick.

The memorial stone of a new church for the united Congregational and Evangelical Union bodies in Perth was laid on Saturday. The church, which is estimated to cost £5,000, is situated at the junction of Kinnoull-street and Murray-street. The architects of the building are Messrs. Steele and Balfour, Edinburgh.

"The Progress of Art in English Church Architecture," by T. S. Robertson, will be published shortly by Messrs. Gay and Bird. The work, which is intended to be a help to those who desire to realise the ideal of beauty as it is expressed in Gothic architecture, is illustrated by sketches from churches of all the periods of English architecture.

A large company assembled at Manchester College, Oxford, on Monday, at a meeting for the acceptance of Mr. Arthur Greg's gift of a carved oak screen and benches for the chapel.

St. Margaret's Church, Halstead, Kent, has recently been enlarged, an expenditure of about £900 having been made in providing a new north aisle and vestry. On Tuesday the Bishop of Dover performed the opening ceremony.

St. Michael's Church, in Gresham-street, London, has been turned into a bank. The change has been brought about by the London Joint Stock Bank, who have acquired the building, and converted it into one of their branch businesses.

Building Intelligence.

BATH.—The Duke of Cambridge opened on Monday the new annexe to the Pump-Room, and laid the foundation-stone of the Art Gallery. The main feature of the additions to the Pump-Room which has been carried out from plans by Major Davis, F.S.A., is a large concert-hall placed at right angles to the Roman bath. There is a central dome to the roof, 55ft. high, and at each end semi-domes 40ft. high. These domes are carried by arches resting on ten columns of Pavonazza marble, with Devonshire marble bases and gilded capitals, and they are enriched by plaster-work. In the spandrels of the centre dome are figures of the Four Seasons modelled in low relief by Mr. Schenke. Each is represented by a female figure standing on a winged globe, on which are indicated the Signs of the Zodiac of the particular season. There is a promenade, and spacious corridors run round the building and communicate both with the terrace overlooking the Roman bath and with the promenade. The corridors themselves are vaulted and domed throughout, and lighted principally from the top with a circular eye in the centre of each dome. A prolongation of the north corridor leads directly into the east vestibule of the old Pump-Room and connects the extension with the old building. In this north corridor is a separate entrance from the Abbey Churchyard, while at its north-east angle is the staircase down to the museum. This corridor and staircase are adorned with columns of Devonshire marble. Along the east corridor are the ladies' parlour and the gentlemen's smoking-room, while along the west are the ladies' and gentlemen's cloak-rooms and attendants' room. From the centre of the west corridor a stair leads to several rooms over the east end of the old pump room appropriated to the orchestra and a music library. The building throughout is lighted by electricity. The space beneath the building is to be used as a museum for Roman and other antiquities; its walls, piers, and arches are all carried out in cream white glazed bricks. It is paved with red cement divided into squares with bands of Pennant stone. There was at first an idea of covering over the Roman bath, and although the plans were altered so as to leave it open to the sky, a good deal of work has been done in connection with it. The design adopted has as its model the atrium of a Roman house. The bath is in a hall some 110ft. by 68ft. On each side of the water stand the remains of the piers which carried the vaulting of the roof; of these piers and the surrounding walls an average height of four or five feet remains all round. Over the columns on the east, south, and west sides stand statues of eight of the Roman emperors and generals engaged in the conquest and occupation of Britain under the Romans, with an ideal bust of Roma on a terminal at the south-west angle. These are all the work of Mr. G. A. Lawson, H.R.S.A., the sculptor of the circular friezes on the municipal buildings. The Art Gallery will complete the range of municipal buildings opened several years ago, and has, like that block, been built from designs by Mr. James M. Brydon, F.R.I.B.A., of London.

CARLTON.—The new Church of St. Botolph, Carlton-in-Cleveland, was consecrated on Friday, the 15th inst., by the Archbishop of York. The church is designed in the 14th century style of English Gothic, and consists of a nave and chancel, with clerestory, under one unbroken roof; a west tower, which is only completed as far as the nave-roof level at present, north and south aisles, and south porch. The internal walls are of dressed local stone, as well as the exterior. The main roof is of barrel form, with a boarded and panelled ceiling of oak. The church has been designed by Mr. Temple Moore, and the contractor is Mr. R. P. Broton, of Bilsdale.

CREWE.—The Earl of Crewe, on Saturday, opened an Art School, a Technical Institute, and a Sanatorium at Crewe. The buildings have been erected at a cost of nearly £20,000. The architect of the technical institute and art school, which together form one block, was Mr. James Stephens, F.R.I.B.A., of Manchester and Macclesfield; the builders were Messrs. A. and H. Hulse, of Winsford, and the clerk of works was Mr. S. Dobson, of Crewe. The building is designed in the English Renaissance style; the front is of Ruabon brickwork, with enriched terracotta panels designed by the architect. The building

has one principal entrance, and a subsidiary one out of Richard Moon-street to the laundry and cooking departments, which are isolated from the other parts of the building. On the north side of the building the art rooms are found. A painting and life room is 27ft. 7in. by 16ft. 10in. by 14ft. 8in., equipped with easels, furniture, &c. There are also a modelling room, 16ft. 10in. by 16ft. 10in. by 14ft. 8in., art master's room, modelling stores, and art stores on the ground floor. On the first floor are a general classroom, 22ft. by 17ft. by 14ft., lecture-room, 53ft. by 29ft., with windows on three sides, which will be utilised as a chamber for the Crewe Town Council to hold their meetings in, and adjoining is a lecturer's or committee-room. On this floor are also an elementary art room, 56ft. by 30ft., and an antique room, 22ft. by 18ft., and on the floor above are the caretaker's rooms. The Sanatorium occupies an isolated area of five acres off Middlewich-street, and consists of an administrative block and five pavilion blocks.

DARLINGTON.—The new technical college was opened on Friday by the Duke of Devonshire. The building is situated in Northgate—the principal thoroughfare—and has been erected from the designs of Mr. G. G. Hoskins, J.P., F.R.I.B.A., of Darlington. The central tower rises 80ft. from the pavement level, and the building itself is three stories high. It has a frontage to the street of about 140ft., and a like extent is covered by a wing on the south side. The style of the building is Perpendicular Gothic, of the florid English type, which prevailed from 1460 to 1570. The vestibule is a conspicuous feature. The main structure is of brick, with facings and windows of Burmantofts tawny bluff terracotta, supplied by the Leeds Fireclay Company, and there are two figures, representing Science and Art, over the gables, which flank the central tower, which rises to a height of 80ft. On the semi-basement are workshops for various trades, including woodwork, metallurgy, plumbing, carving, cookery school, laundry, &c., and on the ground-floor there are the chemical laboratory classrooms, physical lecture-room, administration rooms, rooms for engineering and drawing classes, optics, &c. The first floor, which is nearly all given up to art, includes a splendid art room 90ft. by 30ft. There are over 560 students in the different departments. The building, which was illustrated by a perspective in our issue of February 1, 1895, has cost about £13,000. The contractors for the principal trades were:—Excavators', bricklayers', masons' work and terracotta and fire-proofing, Messrs. McKenzie Brothers; carpenters' and joiners' work, Mr. R. T. Snaith; slaters' work, Mr. John Wandless; plasterers' work, Messrs. Thos. Robinson and Son; plumbers' work, Mr. Emmerson Smith; glaziers' work, Mr. Robt. Smith; painters' and decorators' work, Messrs. W. H. and W. Hoskins, all of Darlington; marble terrazzo pavement, Mr. Jos. F. Ebner, London; stained glass, Messrs. Atkinson Brothers, Newcastle-on-Tyne; wrought-iron casements, Mr. Geo. Wragge, Salford; ornamental wrought-iron gates, grilles, &c., and gas fittings, The Princess Art Metal Works Co., Manchester. Mr. Jos. Dalton was the clerk of works.

EAST MARKHAM, NOTTS.—The church of St. John the Baptist, which was refounded at the end of the 14th century by Judge Markham, was reopened a fortnight since, the occasion being the dedication of the altar and the blessing of the Brameld memorial window. The tomb of the founder of the church is in the chancel. It was much defaced by the Parliamentarian soldiers in the 17th century. The church, which is of the Perpendicular style, has a large chancel and two side aisles and a lofty embattled tower. Its proportions are magnificent, and one of its chief beauties is the clerestory windows. It also contains several ancient monuments and armorial paintings of the Markhams, Cresseys, Merrings, &c. The restoration was begun in 1883, when the fabric and the roof were considerably improved and strengthened, and it is now intended to improve and replace the fittings. A start has been made by providing new altar and hangings, and by inserting at the east end of the church a stained-glass memorial window in memory of the late vicar, and it is proposed later on to restore the screen and loft, on which will probably be placed an organ. During the improvements, when the floor was being taken up in the north aisle, the discovery was made of an old altar slab, which lay as a paving stone in front of the

chancel. The window was designed by Messrs. W. Bucknall and J. N. Comper, of Westminster. The cost was in excess of £400. Messrs. Brameld and Smith, of Brazenose-street, Manchester, are the architects for the restoration.

GIGGLESWICK.—The Duke of Devonshire recently laid the foundation-stone of a chapel which is about to be built for Giggleswick School by the munificence of Mr. Walter Morrison, M.P., vice-chairman of its governing body. The school is in a romantic spot in Ribblesdale not far from Settle. Hitherto it has lacked a chapel, and one is now about to be erected on a rocky knoll, where it will form a conspicuous object in the landscape. The general character is to be Gothic. The plan, which is unusual, consists of a Latin cross, with a dome over the crossing, surrounded at the four angles by turrets, which are crowned by small cupolas. The choir is placed under the dome, and the shallow transepts contain each a gallery, that in the north transept being intended for the organ. The school will occupy the nave, which is lighted by a clerestory, and has a narrow and low aisle on each side for access to the pews. The materials will be chiefly the local stone of various kinds, including a black limestone, which will be used in bands or chequers with the lighter-coloured masonry. Owing to the rapid fall of the ground, height is found under the chancel for a vestry, which will be reached by a stair in the north-east turret. The dome will be of concrete, with a wooden covering, laid with sheet copper, and it is to be surmounted by a stone lantern and a cross of gilded metal, resembling those on Oriental churches. The principal dimensions are:—Length, 101ft.; breadth of transept, 54ft.; of nave, 46ft.; height of dome above the floor of nave, 85ft.; and above the vestry floor, 92ft. The plan shows seats for 344, with a good deal of free space. The architect is Mr. T. G. Jackson, R.A., and the work is being carried out under his direction, without a contractor, by Mr. Evans, his clerk of works.

GOLCAR, HUDDERSFIELD.—New board schools in Crow-lane were opened last week. They have been erected from plans and under the supervision of Mr. Jos. Berry, architect, Queen-street, Huddersfield. The building, which comprises mixed and infants' departments, has a central hall, 54ft. 3in. by 32ft., and five classrooms, two classrooms providing accommodation for 50 children each, and three classrooms for 40 children each; whilst 60 places are provided in the central hall, making a total of 280 places in the mixed school. In the infants' department there are 146 places, and a total of 426 in both schools. Two rooms are also provided for the head-teachers. There are separate entrances, lavatories, a cloakroom for girls, boys, and infants. There is also a woodwork-room for 36 pupils and a cookery-room for 40 pupils. The floors are laid with wood blocks on concrete. All the internal joiners' work is pitch-pine, varnished; and the partitions between the classrooms and central hall are utilised as museum cases glazed with clear glass. Rising galleries are formed in all the classrooms, which are fitted up with deal desks and cupboards. The schools are heated with hot water on the low-pressure system by radiators. The playgrounds are covered with stone asphalt macadam, and are fenced in. The accepted tenders amounted to £4,304 18s. 6d., being £10 2s. per head without the places provided in the woodwork and cookery-rooms.

GOSFORTH.—The new Home for Crippled Children in Salter's-road, Gosforth, near Newcastle-on-Tyne, was formally opened the other day. The site covers two acres of land, and the new buildings will afford accommodation for 110 children (73 boys and 37 girls) and the necessary staff of officials and servants. The style of architecture is Classic in feeling, and Domestic in character. On the right of the entrance are the master's and matron's sitting-rooms, girl's playroom, workroom, or classroom, and beyond a schoolroom. To the left of the entrance is the committee-room, reading-room, and library, and boys' playroom. These rooms face south, overlooking the playgrounds, and are connected by a main corridor 6ft. wide and 123ft. long. There is a similar corridor over, and both have fireproof floors. The first floor of the main building over the rooms before enumerated contains two dormitories for 27 beds each, and four for 10 beds each, master's, matron's, and nurses' bedrooms and linen store. Behind the main corridor, on the ground floor, are the lavatories

and cloakrooms for boys and girls, dispensary, and matron's stores, and the boys' and girls' staircases, and on the first floor four bathrooms supplied with hot and cold water. In the centre, and behind the main buildings, is the dining-hall and kitchen block (with dormitory on first floor for 36 beds), scullery, bakehouse, larders, servants' hall, and tradesmen's entrance, and along the north front, on the one side, is the laundry, and on the other workshops and storerooms approached by covered ways through the cloakrooms opening out of the main corridor. Each of the three large dormitories has attached thereto an annexe for sanitary offices disconnected by the usual cross-ventilated lobby and a fire-escape staircase leading to the open courtyards. The contract for the erection of the new building was entrusted to Mr. S. B. Burton. The work has been carried out under the personal superintendence of Mr. Edward Shewbrooks, architect, of Newcastle, assisted by Mr. Codling as clerk of works.

KINGSTON-ON-THAMES.—On Monday last the Mayor of Kingston opened the public baths which have been erected by the corporation from the designs of Messrs. Francis J. Smith and Maurice B. Adams, F.R.I.B.A., joint architects. Mr. W. Cunliffe, of Kingston, is the builder, Messrs. Z. D. Berry and Sons the pumping and heating engineers, and Mr. C. J. Parker is the clerk of the works. We published a view and plan of the buildings in the BUILDING NEWS for March 12 last. The accommodation provides, besides the full-sized swimming-bath with a pond 90ft. by 30ft., a series of first and second-class slipper-baths for men, and a series for women. Club-rooms and an establishment laundry are provided; separate entrances are provided, so as to use the bath as a hall. The façade is treated in a picturesque manner with shaped gables in stone and red brick. Mullioned windows and stone arched doorways give solidity to the effect, the design being modelled after the English Renaissance. The interior is rendered bright by colour. Electric light is used throughout. Economy of administration has governed the plan, and Alderman Coppinger, the chairman of the baths committee, in proposing a vote of thanks to the architects, on Monday, said that he was familiar with a large number of baths throughout the country, and he asserted with confidence that the cost of their new public baths compared in every way, especially in accommodation and artistic elevation, most favourably with any others to be seen anywhere, and they were, in respect of price, unique.

LOWESTOFT.—The foundation-stone of the new Technical and Art Schools was laid last week by Sir Savile Crossley. The institution will be the only one of its kind in East Anglia, being what is described in the code of the Science and Art Department as an "organised science day school, giving a thorough and progressive course of education in science, combined with literary or commercial instruction, adapted to students whose education is such as would fit them to enter Standard VII. of a public elementary school." At the end of 1895 architects were invited to send in plans, and a considerable number responded to the invitation. Those of Mr. G. W. Leighton, 6, Princes-street, Ipswich, were selected, and after certain modifications had been made tenders were asked for, and that of Mr. A. Bedwell, at £4,995 was accepted, the site having meanwhile been purchased for £950. The building will be of red brick, with Bath-stone facings, and will consist of two stories. The ground floor will comprise the following rooms, approached by a corridor from the entrance on Clapham-road:—On the left of the corridor there will be a lecture-hall, capable of seating 250 people, preparation-room for preparing experiments, dark-room for photography, head master's room, and practical woodwork room. On the left of the corridor there will be a cookery-school, with kitchens, pantry, &c.

MOTHERWELL.—A new police office and barracks are being built at Motherwell, Lanarkshire. The plans show the present structure remodelled with considerable extensions, and raised to a height of three stories. The first-floor accommodation comprises charge-room, waiting-room, and private rooms for superintendent, inspectors, and subordinates. A long corridor off the charge-room communicates with eight ordinary cells and one association cell. On the second floor there is a large muster-room and drill hall, and the third story contains eighteen

dormitories for single constables, with dining-room, recreation and writing rooms, bathrooms, &c., together with a specially-heated apartment for drying the clothes of the men in wet weather. There are six houses for married men, separate from the administration and cell departments. Courts are provided on the site for outdoor recreation and drill. The old offices will give place to a composition in the Scottish Baronial style. The plans show the building plainly treated, and to be executed in stone. The probable cost is between £7,000 and £8,000. Mr. Alex. Cullen, F.S.A., Motherwell, is the architect.

PAIGNTON.—The new church of St. Andrews, in Sands-road, which has been built in sections from plans prepared by Messrs. Fulford, Tait, and Harvey, of Exeter, was dedicated by the Bishop of Exeter on Tuesday week. The entire cost has been about £8,000, almost the exact sum mentioned originally by Mr. Robert Medley Fulford, F.R.I.B.A. (now the Rev. R. Medley Fulford, Rector of St. Andrew's, Grenada, West Indies) as its probable cost. Built in freely-treated French Gothic of the 14th-century style, the church is designed to seat 400 worshippers. It is constructed of red brick burnt from clay in the parish, with dressings of Ham Hill and Bath stones. A feature of the building is the inlaid and sculptured marble pulpit. Byzantine in character, it is chiefly constructed of Devonshire marbles, although yellow magnesian limestone is also introduced. At each angle are canopied niches in solid marble, having golden tesserae inlaid backgrounds. These niches contain statuettes in white Castellina marble, representing respectively St. Augustine, St. Boniface, Bishop Lacey of Exeter, St. Columba, and Frederick Temple, the present Archbishop of Canterbury. In the panel immediately beneath the preacher's desk is a representation of the crucified Christ, also in white marble. This pulpit is the handiwork of Messrs. Harry Hems and Sons, of Longbrook-street, Exeter. The old bowl is Early Norman, wrought in Paignton red sandstone. It is circular, richly carved, and ornamented by cable moulds and intricate strap ornament. It had a resting-place in a neighbouring garden; but last year it was restored to its original home, the parish church of Paignton. It has now been removed to the daughter church just dedicated, after being repaired at Messrs. Harry Hems and Sons' studios. The first portion of the church was built by Mr. E. P. Bovey, of Torquay, and the final part by Messrs. Stephens and Son, contractors, of Exeter. During the greater part of the work, Mr. James Baker was the contractor's foreman, and Mr. C. Noble the clerk of works.

SHEFFIELD.—The Homes for the Aged Poor, erected by the Sheffield guardians in connection with the scheme for the classification of paupers, were opened on Thursday, the 7th inst., by the Lord Mayor, the Duke of Norfolk. The building fronts to Smilter-lane, and is built on land between that on which the Children's Homes have been erected and that in which the great building of the workhouse stands. At present only eight of the homes have been built, with room for extension to twenty-four. In the centre is the administration block, and on each side four domiciles. They are for married couples, and vary somewhat in design to those intended to be built for either two single men or two single women. Baths are provided, and there is a large clubroom, in which they can all meet together. The ground has been laid out with a walk and terrace in front of the row, and flowerbeds and grass plots, with seats, the inmates being encouraged to tend the gardens. The central block includes bedrooms and stores room for administrative purposes. All the apartments to be used by the aged couples are now on the ground floor, and there is also provided a long ambulatory for walking exercise in wet weather. Mr. George Carr was the contractor for the buildings; Mr. S. H. Uttley fitted the baths and did all the plumbing; Mr. C. J. Innocent, of 17, George-street, Sheffield, is the architect.

STALYBRIDGE.—The foundation-stone of the free library to be presented to the town of Stalybridge by Mr. J. F. Cheetham was laid the other day. The site, which is situated on the east side of Trinity-street, near the Victoria Market, is provided by the Corporation, and a new post-office will be included in the new block of buildings. Mr. Cheetham has undertaken to defray the cost of the erection of the library, the amount estimated being about £6,000. Mr. Medland Taylor, of Manchester,

is the architect of the library, and Mr. Henry Tanner, of H.M.'s Office of Works, Whitehall, has prepared the design for the post-office, a similar treatment for both buildings being adopted. The elevations show a block of buildings, Jacobean in style, with big mullioned windows and bold cornices. The work will be carried out in stone, with some red brick introduced in the chimneys and in the plain wall surfaces. To Trinity-street there is a frontage for the two buildings of about 130ft., two-thirds of which is occupied by the library. This façade is broken up by boldly projecting and gabled bays. There are upper floors to both library and post-office along Trinity-street front, that of the library being mainly occupied by a lecture hall, which extends nearly the whole length of the building. The other principal rooms of the library are a large newsroom, a reference library, a lending library, and boys' and ladies' reading-rooms. A central hall gives access to all these rooms, which are ranged round it, divided off by glazed partitions. The reference library will be furnished and treated as a private reading-room. It has two large bays and an angle nook, in which there will be an open fireplace. The site has been cleared of the old buildings and workshops which have hitherto stood there, and it is probable that active building operations will be commenced early in the new year.

COMPETITIONS.

BOOTLE.—The competition for the proposed Technical School has just been decided. The town council received 22 sets of plans and designs for the buildings, the estimated outlay being £15,000, and called in as assessor Mr. W. E. Willink, A.R.I.B.A., of Castle-street, Liverpool. Acting upon his advice, they resolved, on the recommendation of the Free Library and Museum Committee, to divide the first and second premiums, together amounting to 80 guineas, between Messrs. Best and Callon, of Prince's Mansions, Victoria-street, Westminster, and Messrs. Woodhouse and Willoughby, 100, King-street, Manchester, and to award the third premium of 20 guineas to Mr. A. J. Rowley, of High-street, Oxford. Although the merits of the first two designs were obviously so evenly balanced that the assessor could not see his way to place either distinctly first, Mr. Willink advised that the plans of Messrs. Best and Callon were "better adapted to meet the requirements of the school," and this view being adopted by the town council, that firm have accordingly been appointed as architects for the building.—Another competition is pending at Bootle, and it is to be hoped will be more definitely decided. The town council have also resolved to advertise for competitive plans for new fire-brigade and police sub-stations, and to offer premiums of 50 and 25 guineas, under certain conditions, to the plans placed first and second in order of merit by a professional referee to be engaged to adjudicate upon the plans sent in. The limit of cost is £14,000 for the fire-brigade station and firemen's dwellings and £1,500 for the police sub-station. Plans are to be sent in by December 31st.

BURY ART GALLERY AND FREE LIBRARY.—A specially convened meeting of the Art Gallery Committee of the Corporation of Bury, Lancs, was held on Thursday in last week to receive the report of the assessor (Mr. R. Knill Freeman, F.R.I.B.A.) upon the plans, sent in for competition, for the new Art Gallery and Free Library which it is proposed to erect in Moss-lane. There were 22 sets of plans, consisting of 109 separate drawings, sent in. The assessor reported favourably upon the following seven:—"Mezzotint," submitted by Messrs. Woodhouse and Willoughby, Manchester; "Octagon," Messrs. Cheers and Smith, Blackburn; "Plan," Mr. John Johnson, London; "Diadem," Messrs. Gibson and Russell, London; "Star in a Circle," Mr. F. J. Parkinson, Blackburn; "Simmel," Messrs. Maxwell and Tuke, Manchester; and "Ballon d'Essai," Messrs. J. D. and S. J. Mould, Bury and Manchester. Mr. Freeman further recommended that the three premiums be awarded as follow:—(1) "Mezzotint," (2) "Octagon," (3) "Plan." It was decided that the public be permitted to view daily during the present week from ten to five o'clock, and that the Art Gallery Committee meet at a later date to decide which of the premiated designs be recommended to the council for adoption.

LEICESTER.—The design of Mr. Hy. Harper,

Nottingham, architect, has been selected for the new church and schools (Primitive Methodist) proposed to be erected at the junction of Hinckley and Fossee-roads, Leicester. The church will seat 1,000 persons, and the schools will accommodate 1,000 scholars in three departments, infants, juniors, and institute, each with assembly hall and class-rooms. The cost will be £6,000.

LEEDS.—Seventeen sets of plans have been received for the dead meat market and abattoir which it is intended to erect in Leeds. The sub-markets committee of the corporation spent two hours and a half on Friday examining the plans. They will hold another meeting in a few days to make a further inspection, and to reduce the list from which a selection may ultimately be made.

PETERBOROUGH.—The city council have held a special meeting to consider plans and suggestions for improving and enlarging the present municipal buildings, and after examining schemes prepared by local architects for members of the council, and estimated to cost respectively £14,000 and £2,500, resolved to invite architects to send in competitive designs for additions to the present building, the cost being limited to £2,500, and £50 was also voted in premiums, with the understanding that the principal prize shall merge in the ordinary commission, should the author of the design placed first be appointed architect.

CHIPS.

In the list of receiving orders published in Friday's *Gazette* the name appears of Harry Willard, of Tunbridge Wells, architect.

The new Law Library, Liverpool, is being warmed and ventilated by means of Shorland's patent Manchester stoves, patent Manchester grates, and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. J. Passmore Edwards has subscribed £6,000 towards the building of a Friendly Societies' Convalescent Home at Herne Bay. He will lay the foundation-stone on Saturday, the 6th of November. The building will stand on a site of 7½ acres in extent, about a mile from the town, and will accommodate 50 beds.

During the past three months St. Mary's Parish Church, Bellevue, Edinburgh, has undergone extensive alterations and improvements. The electric light has been introduced into the building, more modern heating arrangements have been carried out, the sitting accommodation has been improved, and the interior has been redecorated. The total cost of the works, the plans of which were prepared by Messrs. Sydney Mitchell and Wilson, architects, was about £1,000.

The first section of the new Court-houses in Glasgow was occupied on Friday for the first time. On the street floor of the new portion are the offices allotted to the Justices of the Peace department and those of the small-debt department; the first floor is devoted to the chambers of two of the sheriffs, and a jury Court-room, with retiring-rooms, and the second and third floors will be occupied wholly by the Procurator-Fiscal's department. The new section has been under reconstruction for more than two years, and a similar period will elapse before the reconstruction of the older portion of the building is completed.

A Local Government Board inquiry was held at Whickham, on Friday, before Colonel Albert J. Hepper, D.S.O., R.E., in regard to an application by the Whickham Urban District Council to the Local Government Board for sanction to borrow £1,200 for works of street improvement, £6,620 for works of private street improvement, and £1,698 for works of sewerage.

It is proposed to erect new parish buildings at Saltash, from Mr. Edmund Sedding's designs. The old schoolroom at the south-east corner of the church is to be utilised in the new buildings. Messrs. Hobbs and Bartlett's tender has been accepted, and the building is to be commenced at once.

A new church was opened on the 14th inst. at Ballasalla, near Castletown, Isle of Man. St. Matthew's new church has just been opened in Lower Douglas, and in Upper Douglas a new church is contemplated to meet the growing population in that district. An effort is being made to restore St. George's Church, for which £2,000 has been raised. St. Thomas's and other edifices in Douglas are being restored and redecorated.

At the Northamptonshire County Council on Friday Mr. Charles Edward Paget, M.R.C.S., medical officer of health for the borough of Salford, by 51 votes to 1 was appointed county medical officer, at a salary of £700 a year and expenses. There were 48 applicants for the post.

RENAISSANCE ARCHITECTURE IN ENGLAND.—NEW BANK AND BUSINESS PREMISES, STROUD GREEN ROAD, N.—CHRIST'S HOSPITAL, HORSHAM.—DESIGN FOR NEW CHURCH, EXETER.—NEW HOUSE AT HAMPESTEAD.—COTTAGE AT LIMPSPFIELD.—HOUSE AT OAKLEIGH PARK.—PLANS OF ROWTON HOUSE, NEWINGTON BUTTS.

Our Illustrations.

RENAISSANCE ARCHITECTURE IN ENGLAND.

THIS work, by Reginald Blomfield, M.A., is reviewed on p. 571.

BANK BUILDINGS, STROUD GREEN ROAD, N.

THIS block of buildings has recently been erected upon a commanding site at the junction of Stroud Green-road and Hawley-road, N., and the premises at the corner are occupied by the London and South-Western Bank. Messrs. Truefitt and Watson, M.M.R.I.B.A., of 5, Bloomsbury-square, are the architects. The lower portion is built entirely in white Mansfield stone, while the upper stories are faced with red bricks with stone dressings.

CHRIST'S HOSPITAL NEW SCHOOLS, STAMMERHAM, NEAR HORSHAM.

ON Saturday the 23rd (to-morrow), it being the anniversary of the founding of Christ's Hospital Schools in Newgate-street by King Edward VI., His Royal Highness the Prince of Wales will lay the foundation-stone of this vast pile of buildings, of which Messrs. Aston Webb, F.S.A., and Ingress Bell are the joint architects. The plans were chosen in competition, and we illustrated the majority of the designs submitted by the selected competitors in the BUILDING NEWS for June and July, 1894. Since then a controversy has been carried on by those who have sought to upset the erection of these admirable schools on the site at Horsham, which was purchased by the governors for the purpose. The bird's-eye view given to-day from the architect's Royal Academy drawing shows the whole scheme, which has been modified somewhat in detail from the original plan, though substantially the arrangement follows out the first idea. There can be no doubt as to the excellent character of the plan as a whole shown by the block plan published herewith, and, architecturally, the governors are to be congratulated on the choice which was made when their architects were appointed, for the selected design, as we said at the time, was undoubtedly the best, admirable as some of the other schemes unquestionably were. The original detailed plan, now being carried out in the main, will be found in the BUILDING NEWS for June 22, 1894. We have no further particulars at the moment.

NEW CHURCH, EXETER.

FROM the Royal Academy we give a drawing of this church, as designed by Messrs. Hall, Cooper, and Davis, architects, Scarborough. There were a very large number of plans submitted for the work, and this among the number. It is freely handled in many ways, and is suggestive, as an

endeavour to get away from the usual methods for ecclesiastical work, without needlessly departing from the historical type which long usage has established as fitting.

NEW HOUSE AT HAMPESTEAD.

THE general idea in designing the house which is the subject of the present illustration has been to obtain some of the excellent effects produced by the beautiful old manor houses of the 16th and 17th centuries which are so numerous in this country, where, with very moderate dimensions, a certain amount of dignity is obtained by a somewhat symmetrical front, combined with the regularity which is the result of an attention to convenience and economy. The building is of brick, covered with rough-cast (as a protection against the driving rain to which the house is exposed), with stone dressings. The mullions are generally of stone, but in some parts of the house, not shown in the present view, they are of wood, and the gables of black and white half-timbered work. The porch, shown in the sketch, has the dining-room on the right and the drawing-room on the left, and in the rear is a lofty hall with large windows for the display of some fine old stained glass. It has a coved ceiling of plaster-work, and the ceilings of the principal rooms are also enriched. There is a billiard-room, morning-room, schoolroom, and boudoir, in addition to the usual bedrooms, &c. The chief rooms have hangings and panelling on the walls, and tall oak mantelpieces. The garden, which is rather difficult to arrange on account of the rapid fall of the ground, will be carried out with terraces and balustrades in the style of the house. The contractors are Messrs. Stephens and Bastow, of Bristol, and the architect is Mr. Thomas Garner, 7, Gray's Inn-square.

COTTAGE AT LIMPSPFIELD.

THIS cottage overlooks one of the most extensive views in Surrey, and on this account two sitting-rooms have been placed upstairs and one bedroom is on the ground floor. The building is very simple and inexpensive, but solid oak of plain design has been used inside, with old Dutch tiles for the fireplaces, and the rooms are effective and pleasing. Mr. R. Brasier was the builder, and the amount of his contract was £705. The architect is Mr. Arthur Keen, of Gray's Inn.

HOUSE AT OAKLEIGH PARK.

THIS house, also from the designs of Mr. Arthur Keen, was recently built in Athenæum-road for Mr. James Collingwood. Messrs. Woodrow and Pitcher were the builders, and they executed their work in a very creditable manner.

ROWTON HOUSE, NEWINGTON BUTTS.

(A DESCRIPTION of these illustrations appears on page 576).

CHIPS.

The Property Committee of the Hull City Corporation have agreed to sell to the Hull and Barnsley Railway and Dock Company the whole of the land known as the Western Reservation, this being required for quay and storage accommodation.

Mr. H. C. Oakley, of Southampton, has been appointed Master of Design at the Leeds School of Art.

Mr. H. H. Law, a Local Government Board Inspector, attended at the Todmorden Town Hall on Friday to inquire into an application made by the town council for sanction to borrow £4,150 for public walks and pleasure grounds on the Stile estate, and £6,500 for the purchase of certain premises opposite Waterside Mill for a depot, fire-engine station, wharf, stables, &c. No opposition was offered.

Notice is given in the *London Gazette* that a petition has been presented to her Majesty in Council by Thomas Bonnar and others and the Worshipful Company of Painters, praying for the grant of a charter of incorporation to "The Institute of British Decorators," and her Majesty having referred the petition to a committee of the Lords of Council, notice is given that all petitions for or against such grant shall be sent to the Privy Council on or before the 24th prox.

The West Riding Rivers Board, at a meeting held on Friday in the Town Hall, Wakefield, considered two schemes for the alteration of the offices of the board—scheme A, which provided for the alteration and extension of the existing offices at an estimated cost of £750; scheme B, which included the provision of a new board and other rooms, at an estimated cost of £1,050. The board decided to discuss the matter in committee.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—The annual conversazione of this association was held on Friday last, by the permission of the Royal Society of Artists, at their galleries in New-street. In addition to the attractive exhibition of paintings on the walls, there was a collection of drawings, photographs, &c., of local architectural work, supplemented by others sent by several leading London firms. Mr. Alfred Gregory's band played a selection of instrumental music during the evening.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The inaugural meeting of the session 1897-8 of this Institute will be held on Monday, Nov. 1, at 8 p.m., when the opening address will be delivered by Professor George Aitchison, A.R.A., president. The programme for the subsequent meetings is as follows:—Nov. 15, "Notes on Renaissance Architecture in Malta," by A. S. Flower, M.A., F.S.A.; Nov. 29, business meeting; Dec. 13, "Brickwork Tests: Report on the Third Series of Experiments," by members of the Science Standing Committee; Jan. 17, 1898, award of prizes and studentships, preceded by business meeting; Jan. 24, President's address to students, presentation of prizes; Feb. 7, "The Housing of the Drama," by E. O. Sachs; Feb. 21, "The Mediæval Campanile at Rome," by J. Tavenor Perry; March 7, business, including election of Royal Gold Medallist; March 21, "The Heraldry of Antiquity," by G. H. Birch, F.S.A., and "Heraldic Drawing," by J. D. Crace; April 4, "Artistic Copyright," by G. Harmand, Avocat à la Cour d'Appel, Paris; April 18, "Domestic Architecture in the United States," by A. N. Paterson, M.A.; May 2, annual general meeting; May 15, "The Libraries of the Middle Ages," by T. G. Jackson, R.A.; June 6, business, annual election; June 20, presentation of the Royal Gold Medal, address by the president.

THE AUCTIONEERS' BENEVOLENT FUND.—The thirty-fourth annual general meeting of the donors and subscribers to the Incorporated Auctioneers' Benevolent Fund was held on Monday at the Mart, Tokenhouse-yard, Mr. Daniel Watney (treasurer) presiding. In the report for the year ending 30th June last it was stated that the subscriptions had exceeded those of any previous year, the amount being £393, whilst the donations were close on £36. The investments now had reached the figure of £9,035. A larger number of cases than usual had been relieved during the year, and the committee expressed the hope that there would be a corresponding increase in the number of subscribers to this deserving charity. The chairman said that the report was, he thought, a very satisfactory one. Ten years ago the investments were £4,014. Now they were over £9,000. Again, ten years ago the annuities were seven in number, and now they were 14. He moved the adoption of the report. The motion was seconded by Mr. H. J. Thurgood, and agreed to, and the retiring members of the committee, Messrs. C. E. Cassar, F. Lewis, C. Oakley, E. W. Rushworth, H. J. Thurgood, and S. Walker, were re-elected.

Lady Margaret Charteris laid, on Friday, the dedication-stone of the church of St. Cuthbert's, Millwall, to which will be added a club and school-rooms.

The Bishop of Ripon will shortly consecrate the new church of St. Luke at Harrogate, which has been built to meet the requirements of the thickly-populated Skipton-road district. The cost of the building, exclusive of the upper part of the tower and spire, is £8,000. The seating accommodation is for 800 persons.

The City Court of Common Council received at their last meeting a report from the Bridge House Estates Committee, making proposals for dealing with premises in Finsbury-circus, West-street, Finsbury-pavement, Albion-place, London-wall, and Blomfield-street, at the expiration of the present leases in 1899. The committee suggested that the whole of this great area should be rebuilt and improved, and they anticipated that the rental value of the ground would be increased from £4,000 to £20,000 a year by the improvement. The report proposed the formation of a new street parallel with Moorgate-street, and that the whole area should be put up to public competition as building land. Strong opposition was offered to the proposals on the part of the present tenants of the properties, and its consideration was adjourned till Thursday in next week.

ROWTON HOUSE, NEWINGTON BUTTS,

Engineering Notes.

APPERLEY TUNNEL.—The Midland Railway Company are about to undertake an improvement which will have a great effect in facilitating the traffic between Leeds and Bradford and Leeds and the North. The improvements that have now been going on on that part of the system have practically been brought to a standstill on account of the obstacle presented by the Apperley and Shipley tunnel, about three-quarters of a mile in length, which will not allow of the continuation of the four sets of metals now carried up to within a short distance of each side of it. It is proposed to construct a second tunnel alongside the existing one, and through this will be continued the four sets of metals that have been laid almost as far as Apperley Bridge. The new rails will join the main line again on the Leeds side of Shipley, at the point where the four roads have been laid from Bradford in the direction of Leeds. Already negotiations are proceeding for treating with the landowners, and a Bill will be promoted by the company in the next session of Parliament for power to acquire the necessary land and construct the tunnel.

CITY AND SOUTH LONDON RAILWAY.—Under the engineering supervision of Sir Benjamin Baker and Mr. David Hay, Messrs. John Mowlem and Co. are carrying out the extension works of this railway, which comprise the boring of a couple of tunnels from the Borough side of London Bridge, under the bed of the Thames, and on to Lombard-street (where the difficult task of preserving the Church of St. Mary Woolnoth intact while constructing a railway station in the earth beneath the building is being accomplished), and thence to Short-street, Finsbury-pavement. This work probably will be completed by the end of next year. The company has power to continue the railway as far as the Angel, at Islington, but that work has not yet been put in hand. Meanwhile the company is arranging to proceed forthwith in the work of extension at the other end of their line by carrying the railway from the present southern terminus at Stockwell to Clapham Common.

MERSEY DOCK EXTENSIONS.—The important scheme of dock extension at Liverpool was formally submitted to the Mersey Docks and Harbour Board at the last meeting. The works committee, with a view to providing increased accommodation for vessels of the largest class, recommended for approval a scheme of the engineer, which will involve an estimated expenditure of £316,000. They also recommend that borrowing powers be sought for defraying the cost of these projected works, in addition to £817,000 for works authorised by the Act of 1891, and £300,000 for the construction of the new tobacco warehouses at the Stanley Dock. The total sum required will be £4,433,000. At the south end it is proposed to construct four branch docks, two on the west side of the Queen's and two on the west side of the Wapping Docks, flanked with double-story sheds, and to deepen and widen those docks and the connecting passages. There is to be a 630ft. graving dock on the site of the present Queen's half-tide dock and a 620ft. graving dock on the site of the present Brunswick graving dock. The Coburg, Brunswick, and Union docks are to be deepened and otherwise brought up to present requirements. The improvements at the north end include the construction of a branch dock on part of the site of the Sandon graving docks, flanked with double-story sheds. There is to be a graving dock of 1,000ft. long and 90ft. wide near the Huskisson dock. Part of the Sandon dock is to be converted into a deep branch dock, and the Huskisson branch docks No. 1 and 2 are to be improved and deepened. The outcome of the scheme is that provision will be made for a very large number of vessels of 800ft. long, for a number of vessels over 900ft. long, and, roughly, about 250,000sq. yds. of shed floor. It also provides three excellent new graving docks, and a new entrance is made into the southern system. The south-end docks, which are to be brought up to date, were constructed from 80 to 100 years ago, and when the Wapping and Brunswick docks were constructed, a vessel of 150ft. was looked upon as a big ship.

MONTREAL.—The great Victoria Tubular Bridge, carrying the Grand Trunk Railway across the St. Lawrence River, Montreal, which was built by Robert Stephenson during 1854-1859,

is to be replaced by truss spans carried upon the original masonry piers. The old bridge was one of the wonders of engineering skill at the time of its erection. The work upon the new structure has been commenced in the present year under the supervision of Mr. Joseph Hobson, chief engineer, Grand Trunk Railway. The tubular bridge was a single-track structure, and formed a continuous iron tunnel, the tubes being connected over the piers; and though in recent years ventilating openings have been cut, yet the smoke and gases from the engines have induced corrosion, while there has been some corrosion of the floor system by the brine dripping from the modern refrigerator cars. The rails are carried on longitudinal timbers. The new bridge will contain two lines, and will, like the present bridge, have 25 spans; 24 of these will be 254ft. long, and the other will be 348ft. span. All the spans will consist of two pin-connected trusses, 31ft. 2in. centre to centre, and 40ft. deep, with plate-girder floor beams suspended from the pins of the bottom chord. The chords will be parallel, making trusses of uniform depth, except that the 348ft. span will have a curved upper chord. Across the top of each pier, under the ends of, and parallel with the trusses, are 14 rolled joists 24in. deep, seven on each side, and upon these rest the shoes. The rails of the two tracks will be spiked to sleepers 23ft. long, laid in troughs composed of two angle irons. Heavy timber guard rails will be laid outside the rails of the permanent way. The floor girders extend about 17ft. beyond the trusses, carrying a roadway 12ft. wide, and a footwalk 4ft. wide. A local electric tramway company will run a service of cars over the bridge in the space between the railway trains. The trolley will be suspended from the top lateral bracing by insulated hangers. The bridge is to be of mild steel. The trusses will be erected by the Detroit Bridge Works, but the building of the trusses has been distributed as follows:—Ten by the Detroit Bridge Works, nine by the Union Bridge Company, and six by the Dominion Bridge Company.

NEWFOUNDLAND.—The Newfoundland trans-insular railway is now an accomplished fact. The line extends from St. John's, the capital, on the eastern coast, to Port-aux-Basques, at the south-western extremity of the island, 50 miles from Cape Breton. A railroad now unites all England's possessions in this quarter of the globe, stretching from the Atlantic to the tidewaters of the Pacific, unbroken save at Cabot Strait, between Port-aux-Basques and Sydney in Cape Breton, which channel will be bridged by a fast ferry steamer, covering the distance in six hours. The trip across Newfoundland will be made in 24 hours. The line is narrow gauge (3ft. 6in.), laid with 50lb. rails, and was built by R. G. Reid, of Montreal, who constructed much of the Canadian Pacific road. All the bridges are of steel with native granite piers and abutments laid in ashlar masonry. For the accommodation of tourists large hotels will be built at suitable points along the line. The main or through line is 547 miles long, with a branch line of 29 miles to Brigus, Harbour Grace, and Carboneau, another of 26 miles to Placentia, and a third of 12 miles to Notre Dame Bay. The total mileage is about 615, and the cost has been 15,600dol. per mile, a total of 9,594,000. There remain stations, terminals, and docks to be built yet, which will increase by 500,000dol. the colony's total outlay for railway purposes.

The parish schools in St. Nicholas Churchyard, Ipswich, were formally reopened on Thursday in last week by the Dean of Norwich, after having been rebuilt from plans by Mr. Frank Brown, of Prince's-street, Ipswich, and conversion into a parochial hall. The new hall measures 38ft. by 25ft., and is 18ft. in height. It is seated with chairs for 300 persons. Mr. W. Grayston, of Ipswich, was the builder.

At a special meeting of the urban district council for Mold, Mr. Edwards, of that town, was appointed as surveyor, in succession to Mr. Isaac Jones, resigned. It had been said at a previous meeting, that no candidate from England or even South Wales would have a chance if accepted, and of the 29 candidates the selection by the committee comprised five names, four of residents in the town and one at Swansea, the latter being, of course, at the bottom of the poll on the preliminary voting.

A license has been granted by the East Sussex magistrates for a residential hotel to be erected on the roadside between Crowborough Cross and Uckfield. The total cost of building and stables, for which Mr. Samuel Denman, of Brighton, is the architect, will be between £15,000 and £20,000.

STAINED GLASS.

BIRMINGHAM.—The west window in St. Philip's Church has been filled with stained glass as a memorial to the late Bishop Bowlby. It was designed by Sir Edward Burne-Jones, and has been executed partly under the direction of the late Mr. William Morris, and since his death completed by his firm. The subject is "The Last Judgment," thus completing the original scheme, the three chancel windows illustrating the Incarnation, the Crucifixion, and the Resurrection and Ascension. The highest portion is, says the *Birmingham Post*, occupied by the figure of Our Lord in glory, wearing the crown of thorns, His right-hand raised in blessing, His left-hand pointing downwards. He is seated on the great rainbow throne, beneath and around which is shown the light of a broken and troubled dawn. Behind the figure of Our Lord are seven angels, bearing the seven vials, standing out from a crowd of seraphic and angelic forms which fill the background. Beside the Judge, a little lower, are two angels, one of whom holds the sealed book, while the other holds the chain and the keys which are to bind the Great Dragon, the Spirit of Evil, when judgment is completed. The centre compartment of the window is allotted to the Angel of Judgment, blowing the trumpet which calls the quick and the dead before the judgment seat. Behind, and again somewhat below this figure, are towers and cities shaken by an earthquake into ruins. Again below, in the nearest compartment, is a group of those who are answering the call to judgment—men, women, and children. Below all a line of cold, flat, grey tombs forms the base of the design.

CHIPS.

The new church of St. Luke at Harrogate will shortly be consecrated by the Lord Bishop of Ripon. The church, which seats 800 people, has been erected at a cost of £8,000.

In order to provide for a great increase of traffic, the Great Northern Railway Company is about to double its branch from Luton to Dunstable. The widening of the main line between King's Cross and Huntingdon is proceeding rapidly, and already several sections have been opened for traffic.

The Islington Vestry has decided to subscribe £2,000 towards the purchase of the Churchyard Bottom Wood, Highgate, provided that the balance of the purchase-money—£23,000—is otherwise subscribed.

The remarkable collection of Greek coins of Asia Minor formed by the late French Ambassador, M. W. H. Waddington, which has recently been purchased by the French Government for the Bibliothèque Nationale for £16,840, places the French collection of the Greek autonomous and imperial coinages of Asia Minor far ahead of those of the British and Berlin Museums.

The Nottingham Corporation on Saturday purchased the city tramways at a cost of £80,000, representing a payment of £10 per share.

The work of surveying and building the railway between Moscow and Windau is being actively proceeded with. The section between Tukum and Windau, 104 kilometres long, will be completed and opened for traffic next summer.

In commemoration of the Diamond Jubilee a set of hemispherical chimneys of ten bells has been erected at St. James's Church, Bermondsey, at the expense of an old parishioner. The fine peal of ten bells, which had not been rung for a long time, has also been put in thorough order. The bells were dedicated on Saturday. These commemorative schemes are in addition to the building of almshouses in the parish, towards which nearly £2,000 has been subscribed.

At the last meeting of the Weymouth Town Council it was stated that the Great Western Railway Company have in contemplation important works of railway extension, under an arrangement with the Government. At present the district of Wyke Regis, overlooking Portland Roads, and where are situated the Whitehead torpedo works, are not served by any railway, the nearest line being the joint line between Weymouth and Portland. It is now proposed to make a line to pass through Westham and Wyke, passing by Sandsfoot Castle to Newton's Cove. In connection with this scheme the Weymouth Council are applying for a loan of £11,000 for purposes of harbour improvements.

At the last meeting of the Burton-on-Trent Town Council, a long and animated discussion took place on the application of the late surveyor (Mr. J. E. Swindlehurst), now city surveyor of Coventry, for the payment of £150, for professional service rendered in respect of outstanding corporation contracts, the contention of several members being that the claim was exorbitant, and it was agreed that the matter be referred to the committees affected, after an amendment, offering £75 in full settlement, had been defeated.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Found copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLII., XLIII., XLIV., XLV., XLVI., XLVII., XLVIII., XLIX., L., L.I., L.II., L.III., L.IV., L.V., L.VI., L.VII., L.VIII., L.IX., L.X., L.XI., L.XII., L.XIII., L.XIV., L.XV., L.XVI., L.XVII., L.XVIII., L.XIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—P. J. S.—I. T. C.—H. R.—O. B. and Co.—G. J. H.—T. P.—W. and Son.

"BUILDING NEWS" DESIGNING CLUB.

JOHN R. PATRICK. (We fear you do not read your BUILDING NEWS, otherwise you would have seen the subject with which the Club opens the present session, published in last Friday's issue, on page 540.)—H. F. GREEN. (Yes; the drawings are returned to the competitors. One sheet of paper of the stated size should only be used.)—SMALL FEY. (Age is no criterion. We want contributors not so young as to be unprepared to learn, and not too old to be beyond work.)

Correspondence.

COMPETITIONS TO BE AVOIDED.

To the Editor of the BUILDING NEWS.

SIR,—Is it still beyond the powers of competent architects to resist the temptation to indulge in gambling? If it were, surely the local authorities would not be so persistent in their endeavours to organise lotteries in the form of architectural competitions. Here is a sample: A town that shall be nameless requires a public building, to cost several thousands. Two premiums are offered as a bait. The aggregate amount of the premiums is probably not more than one-twentieth the sum that the foolish competitors will find themselves out of pocket after the lottery is over; and, by the way, only one-sixtieth of the amount expended will need to be paid to innocents who are attracted, because, as usual, the larger premium will merge in the commission. The maximum remuneration to be gained by the successful competitor for services to be rendered, will be, in round figures, £500, provided he be appointed architect; but, after all his expenses in preparing sketch-plans (which in reality will be gratuitous work), he is asked to plunge deeper and deeper into expense before he can, with certainty, hope to secure the commission, for he must be prepared to secure a builder's tender to carry out the work for the specified sum, which

will, in the first instance, involve the architect in surveyor's charges equal to, say, one-third his ultimate remuneration, which he must run the risk of having to pay should he be so unfortunate as to exceed the stipulated outlay, which, in the very nature of things is the most probable result of open competitions, because the man who succeeds is usually the one who can venture to promise what it is frequently impossible in the end to obtain for the expenditure proposed.

Surely it would only be fair, when promoters of competitions do select designs which in their judgment or their advisers' appear desirable and feasible within the prescribed limit of cost, that they should at least bear the cost of taking out quantities and procuring tenders, whether the amount thereof comes within the prescribed limit or not. In that case the architect who competes, and succeeds in having his design selected, but who may fail to obtain tenders which are acceptable, has incurred quite sufficient loss and disappointment in paying for the work done, without being expected to bear the cost of quantities also.

One thing is often overlooked, even by professional assessors and others who advise promoters. An architect is supposed, after he has designed a building sufficiently for competitive purposes, without precise details, and in the absence of a bill of quantities, to have the faculty of determining to within 5 per cent. or 10 per cent. the probable cost of executing his scheme. I make bold to assert that, except as regards very small undertakings, such an idea is based upon one of the greatest fallacies the human mind ever conceived. Contractors are men who are presumed to have a most perfect knowledge of prices of materials and labour, and what do we find? Can they tell, if they look at the sketch plans and report of an architect, what a building will actually cost? When they are supplied with detailed bills of quantities, which it may have taken weeks or months to prepare, how do their tenders compare with each other? Do they agree within anything approaching 5 per cent. or 10 per cent.? Look at the published summaries of tenders in the professional papers—if possible, at some of the unpublished lists which every experienced architect has procured. Among men of experience, it is known that builders' tenders vary enormously.

The public need to have these matters driven home. Professional assessors and advisers to promoters need to be more candid and business-like in their advice. I have had experience both as a practitioner and an adviser in these matters, and it is due to those whom I have had the honour to advise to say that I have never failed to convince them of the folly of seeking to induce architects to give their services without reasonable remuneration. Speaking generally, I hold that open competitions are a failure and a delusion to competitor and promoter alike. Limit competitions, with the right kind of assessor, who, besides being an art critic and an expert, must be a man of sound common sense, who realises that architects, no more than other men, can afford to work for nought, may be satisfactory; but the client is in most cases wisest who can make up his mind as to what he requires, and then retains a reliable, candid architect known to understand the class of work to be executed to be his adviser. —I am, &c., M.S.A.

POOR MORTAR.

SIR,—If your correspondent "F. J. N." will read Mrs. Merrifield's work on "Cennino Cennino," and Eastlake's "Materials for a History of Oil-Painting," he will be able to form some idea of the kind of lime used by the old Roman fresco painters, and possibly thereby that used by the Roman builders, for it is not unreasonable to suppose the supplies for both workers would be drawn from the same source. As regards the experiment your correspondent relates, performed by Professor Lewis, the professor made one very important mistake—viz., excluded the air from nearly all the lime—thus your correspondent says "He (i.e., the professor) joined pieces of flint with slaked lime, and freely exposed the pieces to the air." Now by doing this, the lime was inclosed as a layer between the two pieces of flint which were joined together, and as a consequence, the catalytic action of the atmospheric oxygen could not take place except at the edges of the layer of lime. If the professor had covered the pieces of flint with a not too thick layer of lime, and then exposed same to the air, he would have been experimenting on the right lines, for the atmospheric oxygen could then have reacted on the lime and the flint beneath it.

Building mortar is porous (I am excluding hydraulic lime from consideration, as I made no reference to that in my initial letter on this subject), and therefore air can penetrate the half-moist layer of mortar that is usually laid between bricks, and as a consequence the air has full play on the lime and particles of sand inclosed therewith.—I am yours, &c.,

H. C. STANDAGE,
Consulting Chemist to the Colour, Varnish, and Leather Trades, and Manufacturing Chemist.

SIR,—Your correspondent "F. J. N." points out that the kind of lime has been ignored by your correspondents. This is not quite so, for the merest tiro must be aware of the fact that lime obtained from chalk is a different compound to that obtained from blue lias limestone, the former being a nearly pure lime, which cannot combine with sand chemically to make a silicate of lime; whilst the latter lime has in itself a large proportion of silica and alumina in a state eminently calculated to make such a combination not only possible, but a necessity. It follows, then, that chalk lime must set without forming any silicate of lime, which is not true of lias lime. That the two limes differ considerably, and consequently require different treatment, is evident, for one is soluble in water, and the other is not.

The expression, "stone" lime, is apparently one used only locally, where chalk lime is used too. It can have no particular meaning where the local limestone is a hard rock, like mountain limestone. This latter yields a lime as pure as chalk lime. I quite agree that where several names are given to one substance, these should be enumerated once for all; but when the modern name is given, it should be used exclusively afterwards, so as to accustom experts in building to the use of proper scientific names. I am obliged for Mr. Standage's explanation, and sorry my letter should have caused him any annoyance, for "no offence was meant."—I am, &c., W. E. M.

CHIPS.

A Conservative Club-house is about to be built at the corner of Queen-street and Regent-terrace, Penzance, from plans by Mr. Henry White. The estimated outlay is £1,500.

Under the Employers' Liability Act of 1880, the number of cases tried in the English County Courts last year was 253. The amount of compensation claimed was £36,943, and the total of the amount awarded was £12,540.

A drinking fountain has just been completed in Manchester-road, Bury, Lancs, the gift of an anonymous donor. Mr. T. R. Kittell, A.R.I.B.A., of Plymouth, was the architect, and Messrs. J. and E. Goad, also of Plymouth, executed the work. It is English Renaissance in style, and is built of grey Dartmoor granite, with cornice and canopy of Portland stone, and columns of red Aberdeen granite. The cost has been £600.

At Christ Church, Lee Park, S.E., one of Sir Gilbert Scott's edifices, opened 40 years since, a chancel screen richly carved in Kentish oak, and decorated in style, has just been erected. It has been executed by Messrs. Harry Hems and Sons, of Exeter.

New roller flour mills have been erected in Lattelsey Field, Whittlesey. The mill, which is built of local bricks, is three stories in height, and has been erected by Messrs. R. Clark and Sons, Whittlesey, the woodwork being supplied by Mr. Charles Miller. The machinery has been put down by Messrs. Turner and Son, of Ipswich, and includes six sets of rollers, provision being made for adding others. Steam power is utilised, and a new steel boiler, with Galloway tubes has been put down. Special provision is made against fire, the partition doors between the mill and the granary being lined with iron.

The second annual dinner of the Peterborough Master Builders' Association was held at the Angel Hotel on Tuesday in last week. The chair was occupied by Mr. D. Gray (president of the Association), and the vice by Mr. J. Ruddle, and among those present were Messrs. J. W. Rowe, H. Hammond, James Hicks, J. Nicholls, J. Bridgefoot, M. Hall, W. Jellings, F. H. Cooke, Watson, J. Lucas, J. J. Taylor (secretary), &c. The chairman proposed "The Architects and Surveyors of Peterborough." Messrs. Ruddle and Cooke replied. The toast of the evening, "The Peterborough Master Builders' Association," was given by the vice-chairman, who said the building trade in Peterborough seemed unusually prosperous, whilst the brickmaking industry in the neighbourhood had acquired an almost world-wide renown. Mr. J. W. Rowe responded, and other toasts followed.

Intercommunication.

QUESTIONS.

[11814].—**Fireproof Floor.**—Can any of your readers inform me if a concrete floor can be successfully laid as sketched below? Would the corrugated sheets between joists be liable to sag while concrete was being laid?

Would rough strutting under the sheets be required, and what thickness of concrete would be necessary? The top surface would be finished as an ordinary cement floor.—DOUBTFUL.

[11815].—**Emigration.**—(1) What part of our colonies (or of any other country abroad) would you recommend a young surveyor, &c., to emigrate to for a partnership or a good situation? (2) By what means may he advertise from here for the above situation, &c., and through what papers? (3) Do you recommend any young surveyor to emigrate without getting a situation abroad before he goes?—W. B. E.

[11816].—**Walls after Fire.**—What is the proper treatment to walls after fire? Can the effect of smoke on brickwork be killed by applying a solution? If so, what? A practical suggestion will be esteemed.—W. F. T.

[11817].—**Hospital Construction.**—I shall be glad to know of a cheap work on hospital construction.—HOSPITAL.

[11818].—**Discharge from Sewer.**—What would be the theoretical rate of discharge from a 12in. glazed stoneware pipe sewer, circular section, without bends, 6,700ft. long, with a fall of 1 in 400 (a) flowing full, (b) half full? And how are the results calculated?—ROBSEY.

[11819].—**Flow of Sewers.**—If a pipe sewer of cylindrical section of given length and fall will discharge so many cube feet per minute if flowing half-full, how much more will it discharge if full? If a similar pipe sewer half a mile long will discharge when flowing half-full and full given quantities, will it not discharge less if longer—say five miles long? I have been referring to the tables of discharge in "Hurst's Pocket-Book," but they appear only to be founded on the assumption that a sewer of given diameter and fall will discharge the same amount whether long or short—e.g., diam. 12in., fall of 1 in 10,000, gives velocity 37.5ft. per second, discharge 8.91c.ft. per minute, and would appear to be applicable to a sewer 10,000ft. long with a fall of 1ft., or another 100,000ft. long with a total fall of 10ft. Is that correct?—M.

REPLIES.

[11794].—**Parpoint Facing with Brick Lining.**—In reply to "Gallatow," the term "Parpoint" is purely a Yorkshire term given, I take it, by quarry owners to distinguish rock-faced wall-stones; the true term for this class of walling, according to authorities on building materials, is "regular coursed rubble," and it is immaterial as to being faced both sides, as in parapets, &c., or lined with other material, such as brickwork. In respect to the "through-stones" being damp-conductors, this is contrary to my experience, as this class of stone is very dense. With a more porous stone, by all means use a galvanised-iron wall-tie in preference.—ALBERT C. FREEMAN.

[11799].—**Woodwork of Windows.**—The practice of measuring painting varies much. The usual way is to measure the superficial quantity per yard including knotting and stopping. Measure the superficies of window front over full size of openings for painting frames, the width of window to be measured to include returns to the wall; the same with the height. Take width of shutters, adding for edges inside of boxings by the height. The linings to be collected, elbows and soffits. The sash-frames are numbered, and state if extra size; also the sash-sills. The squares to be taken by the dozen.—METRIC.

[11802].—**Flashings.**—The sketches are not very clear as to the part they represent. Either plan would keep out the wet. The term "flashing" is applied to lead let into the joints of the brickwork and made to lap over the gutter or over the slating of a roof. An apron is in one sense certainly a part of the flashing, and seems to be applied to that piece of lead which hangs over the lead which is turned up against the brickwork; but both terms are often used for the same thing.—A. B.

[11804].—**Building Construction.**—Rivington's work is one of the best for construction; but for other branches "Honoris" should consult other treatises. "Mitchell's Building Construction" gives more than Rivington. It treats of stability of walls, showing the use of formulae; sewer construction, tall chimneys, graphic statics, calculation of girders, roof covering, fire-resisting construction and sanitation, hot-water apparatus, &c. This work is compiled to prepare for the examinations of the Science and Art Department, the R.I.B.A., Surveyors', City Guilds, &c., and will give "Honoris" all he wants for the purpose.—G. H. G.

[11809].—**Fire Insurance.**—I think the architect is acting with more independence if he keeps clear of appointments of this kind, and it is *infra dig* to accept such agencies. Certainly it is not quite professional to advertise that his buildings are insured during erection in the particular office. Notwithstanding, a great many provincial architects become agents, and if they do not push their connection with the office they represent before their clients, there can be no strong objection.—A.J.A.X.

[11809].—**Fire Insurance.**—I do not know whether it is *infra dig* for an architect to be an agent for a fire insurance co.; but I knew a member of the Council of the R.I.B.A., now deceased, who was such an agent. There is the manifest advantage to the architect that if he is an agent, and arranges that all his buildings are insured

through his agency, he knows exactly when, how, and precisely on what terms and conditions his buildings are insured, which he never does when the builder is left unaided to insure.—W. M. R.

[11810].—**Joists in Concrete.**—F. King had better use the expanded metal lathing, which can be fixed to concrete ceiling by metal hooks. This will supersede the use of wood ceiling-joists partly buried in the concrete. No doubt the partial burying of any wood in concrete will accelerate decay if the wood is not seasoned. The "Danville Asbestos" is a good fireproof plaster, which can be used on laths or the expanded metal or "Jilmil" girders, and would be suitable for F. King's purpose.—G. H. G.

[11811].—**Cost of Draughtsmanship.**—The amount of draughtsmen's salaries varies so much that it would be impossible to say what is a fair percentage on the average outlay. No doubt in some cases it may be said that quite 2 per cent. of the architect's percentage goes for draughtsmen, as in the case of competition work, where the drawings are all prepared by assistants. In offices where the principal is actively engaged in interviews and general business, and his architectural work is chiefly done by assistants, the salaries must make a considerable percentage of the remuneration. No doubt this is the main reason why so many architects take pupils who are likely to become good draughtsmen. I know firms who entirely depend on their pupils for the drawings, and thereby save a large amount in salaries; but it is neither just to the pupils nor to their own reputation.—ARCHITECTUS.

[11812].—**Professional Charges.**—Surveyors' charges vary in regard to the charges for their duties. For preparing estate plan and laying out, the charge ought to depend on the time and trouble involved. If "S. H." has kept an account of his time in preparing the plan, he can charge so much per day, say £2 2s., or he can charge a percentage on the ground-rents of the houses shown. The charge for taking levels, preparing plans, sections, and specifications for the roads, and copies, must be charged on the estimate of the cost, say from 2½ to 5 per cent., or by time employed. Negotiating sales of lots are charged for at a stipulated rate, or sometimes a sum equal to the year's ground-rent is charged for letting. In regard to question (b), the superintendence of buildings during their erection and certifying for leases, the charge is sometimes one-half per cent. up to £5,000, and above that by agreement. This superintendence is necessary to see that the conditions are fulfilled. Scales of charges are given in surveyors' handbooks.—G. H. G.

[11812].—**Professional Charges.**—I am sorry not to be able to give the information "S. H." desires, as I have more than twice inserted almost identically the same query in "Intercommunication," but no one has yet taken the trouble to reply. Is professional jealousy the cause of this?—VEDRA.

CHIPS.

The Safety Tread Syndicate, Ltd., of 15, Barbican, London, E.C., have purchased the business of the Positive Nut-Lock Washer Syndicate.

At a meeting of the sanitary committee of the Bristol City Council, held on the 14th inst., the following gentlemen were interviewed with reference to the appointment of assistant city engineer:—Messrs. H. W. Harding, Bristol; A. W. Metcalfe, Bristol; T. L. Perkins, Bristol; L. Wigan, Bristol; E. Frobisher, Leicester; L. P. Marshall, Norwich; G. M. Martin, Leeds; G. G. May, Ipswich; W. J. Steele, Tottenham, N. Mr. W. J. Steele was eventually appointed.

The foundation-stone of a new girls' school was laid at Felixstowe on Tuesday week. The building completes a group of schools for 900 children began some years since, and, like the earlier portions, will be erected from designs by Mr. E. F. Bishopp, architect, of Ipswich. It will comprise a main room and three classrooms, cloakroom, and lavatory. Mr. Thomas Ward, of Felixstowe, is the contractor.

At the monthly meeting of the urban district council for Hants, held on Wednesday week, it was decided to borrow £23,990, a sum which has been sanctioned by the Local Government Board, for the carrying out of various public works in the district.

A scheme for the construction of a gigantic canal for establishing communication between the Black Sea and the Baltic has been submitted to the Russian Minister of Ways and Communications, and has been very favourably regarded. Administrative steps have been taken to assist in the realisation of the scheme.

The five-light east window of the parish church of St. Boniface, Bunbury, Cheshire, is about to be filled with stained glass at the cost of Mr. Ralph Brocklebank, as a Jubilee memorial. It will be erected from designs by Mr. Edward Frampton, and will represent the Crucifixion, the outside lights containing full-length figures of St. Boniface, and of St. Elizabeth of Hungary.

To the series of memorial windows in course of erection in the Chapter-house of Lichfield Cathedral has been added a light at the south-east corner in memory of the Venerable T. B. Lloyd, Archdeacon of Salop, who died at the rectory, Edmondton, on February 25, 1896. The centre panel is occupied with a figure of Alexander de Stavenby, forty-fifth bishop of the diocese, who was consecrated in 1224. The artist is Mr. C. E. Kempe, of London.

The Eccles Town Council have notified the Local Government Board of their intention to borrow £4,928 for works of sewerage and storm-water drainage in the borough.

LEGAL INTELLIGENCE.

LOCAL AUTHORITIES AND DEFECTIVE ROADS.—Judge Yate-Lee was engaged several hours on Saturday at Whitchurch County-court in hearing an important action, brought by John Stephen Walley, a trainer of horses, against the urban district council of Whitchurch, Salop. The claim was for £50 damages, for injuries sustained by his mare through the collapse of a road near Whitchurch on the 6th February last. On the day in question the mare was being ridden by a servant of the plaintiff to a meet of hounds, when the road collapsed underneath the animal, causing serious injuries to its knees and rendering it unfit to compete at several steeple-chase meetings at which it had been entered to run. The road in question is repairable by the defendants, who receive an annual grant from the county council for the purpose. It was stated in evidence that in 1895 a sewer was laid under the road at the exact spot where the accident happened, and the plaintiff's case was that the road gave way through the defendant's servants not having filled up a cavity in the trench in which the sewer was laid, and the point at issue was solely one of the liability of the council. For the defence several witnesses gave evidence, amongst them being Mr. I. Matthew Jones, surveyor to the Chester Corporation, and Mr. Samuel Davies, surveyor to the Wirral Rural Council, both of whom had examined the road. Mr. Jones attributed the collapse to the effect of a thaw after frost. The subsoil was a shifting sand, and during a thaw the road would become broken up and the surface water would cause such pressure on the subsoil as to create a cavity where there was little resistance. The incline at this point was 1 in 40, and his view was that, through the washing of the sand, a cavity had been created beneath the macadam, which gave way the moment the horse got on it. Mr. Davies gave similar evidence, and agreed with the theory advanced as to the cause of the accident. His Honour held that the defendants were liable for an act of misfeasance. He accepted the theory put forward by Messrs. Jones and Davies, and rejected the theory of Mr. Webb, architect, on the part of plaintiff. He held the defendants responsible for the surface of the road after laying the sewer. The cavity might have been prevented by laying cross drains or having drains on the edge of the road. The defendants had not done enough in repairing the road, and judgment would therefore be for the plaintiff, with costs on the higher scale.

"WAITING MONEY."—Three men, engaged in the building trade at Millwall, applied to Mr. Mead at the Thames Police-court, on Monday, to grant them summonses against their employer for not paying each of them 10d., "waiting" money. The magistrate elicited that the applicants were supposed to be paid at twelve o'clock on Saturday, but were kept an hour waiting for their money. It was on account of that time they wanted to claim. Although the amount was so small, they had, in consequence, discharged themselves, and had wasted a day coming to the Court. As the men were unable to produce any agreement, Mr. Mead refused to grant summonses, and observed it seemed to him the complaint was a frivolous one.

WOODEN ENCLOSURES AND THE LONDON BUILDING ACTS.—At Worship-street Police-court, on Monday, the case of A. Payne, district surveyor of East Hackney (South) and North Bow, v. D. Allport, of the Wire Wove Roofing Co., was heard before Mr. Haden Cosser. The defendant had erected a factory at 417, Old Ford-road, inclosing one end temporarily in wood, contrary to the above sections; the company was then reconstructed and the buildings stopped. The district surveyor required either that the factory should be inclosed as required by the rules, or that a license should be obtained from the London County Council under Part VII. for the wooden structure. The defendant, who was represented by a solicitor, did not dispute that he was in the wrong, but asked for time. The district surveyor explained that he had given as long a time as he was able under the Act, and ultimately an order was made to amend the work in six months, "the defendant not objecting," the defendant to pay costs.—A second followed ("Payne v. S. Clay"). In this case the defendant had erected a shed, with substantially-built wooden walls and a slated and iron roof, above the size allowed in the exemptions, and also within the prescribed distance of the centre of the road adjoining, contrary to section 13. The defendant maintained that the building was only a fowls' house, and the road adjoining was his own private way, though the district surveyor showed that it led to two factories, one of which certainly was a freehold independent of the defendant, and to four dwelling-houses. An order was made to amend in 28 days. Twelve shillings costs.

DISTRICT SURVEYOR'S FEES FOR WORK DONE BY DEPUTY.—At Southwark Police-court, on Tuesday, Mark Patrick and Son, builders, were summoned by Bernard Dicksee, district surveyor, for non-payment of his charges, amounting to £23 12s. 6d., for inspecting and supervising the erection of stands

within the premises of Day and Martin (Limited), Borough-road, to view the Jubilee procession. The complainant stated that he had 600 stands to look after, and that he deputed Mr. Brown, a young assistant to an architect, to inspect those erected on the premises in question. Personally, he saw nothing of them except from the street, but he was entitled to his charges. The stands at each window were separate structures, and, although they only held seven persons each, he charged for "inspecting" them the same fees. He also charged for inspecting six stands, which he disallowed on Mr. Brown's report. For the defendant it was contended that the stands were not "structures" within the meaning of the Act, and that the complainant was not entitled to do his work by deputy. Moreover, the young gentleman employed as deputy, apparently about 18 years of age, did not possess the qualifications required for the exercise of large and responsible powers and duties. The hearing was adjourned.

RE A. M. HISCOCKS.—The debtor, an architect and surveyor, of 115, Borough High-street, formerly of the Vestry of St. George the Martyr, Southwark, has presented his petition, and the usual receiving order was granted. An order of adjudication was also made.

CHIPS.

At the last meeting of the town council of Middlesbrough, an electric-lighting scheme, estimated to cost £25,000, was passed, as was also a scheme of drainage to cost £10,000.

A new mission hall in connection with St. Stephen's Church has been erected in West-street, Walthamstow. The hall provides seating accommodation for 200 people, and is a substantial structure with open-timber roof. The exterior is faced with Woodford red bricks. The work was carried out by Messrs. E. Fuller and Sons, the architect being Mr. J. Hewitson Shaw, A.R.I.B.A., of 32, Albert-road, Walthamstow, and 22, Billiter-street, London, E.C.

In the November issue of the *Pall Mall Magazine* is a short romance of the times of Henry of Navarre, entitled, "How Bois-Rosé and I Captured the King." The author is Mr. Edward W. Jennings, A.R.I.B.A., who has frequently contributed to our illustrated pages. His last drawings were published in July, 1895, and were all taken from bits of Renaissance architecture on the Loire. It was while on a sketching tour in the neighbourhood of Laon that he formed the idea of writing the present romance, which is founded on strict facts.

In a short paragraph which appeared in our last issue, p. 541, it was stated that the church of St. Gabriel, Willesden Green, which was consecrated on Oct. 7, was designed by Mr. R. Philip Day. This was incorrect, and Messrs. W. and C. A. Bassett Smith and R. Philip Day should have been described as the joint architects.

The largest and most important sale of freehold business sites ever held in Leeds was conducted on Friday afternoon in the Town-hall by Messrs. Hepper and Sons, who disposed of 54 lots of Corporation surplus property for £71,048 2s. 9d. The most important lot, part of the old Post-office site, was sold at £75 per yard, or £49,950, to the Standard Life Insurance Company.

The gilded iron gates communicating with the interior of the Marquis of Exeter's princely mansion at Burghley have recently undergone renovation at the hands of painters and decorators. The folding gates on the north front are approached by a flight of steps rising to the level of the terrace. They are designed in the *cinque cento* style of Italy, being wrought into groups of flowers and wheat ears, and rampant lions issuing from cornucopias. The gates on the west front are of similar design, but of larger dimensions, and the central panels bear the initials of the nobleman who had them erected. For about 30 years both sets have been exposed to rain and storm without the application of new gilt, and during that time the iron has become corroded in many places, and some of the delicately-wrought parts are more or less damaged. The work of restoring them was a short time since placed in the hands of Mr. T. Hart, of St. Martin's, Stamford, who has now executed the order.

Mr. H. H. Law, C.E., Local Government Board inspector, held an inquiry at Hipperholme on Friday with regard to an application from the district council for sanction to borrow £3,000, for erecting public offices.

Calcutta is now, says the current issue of *Indian Engineering*, the builders' paradise. The earthquake has injured almost every private house; tenants are led to believe that the houses they inhabit may collapse and bury them any day; and house owners are in despair, as they have no choice but to submit to whatever terms the builder may impose. It used to be formerly a very keen competition between builders to secure work; it is now a keen competition between house owners to secure builders who will do their work at all on any terms whatever.

WATER SUPPLY AND SANITARY MATTERS.

CARLISLE WATER SUPPLY.—The Carlisle Town Council have, after a discussion of two and a half hours, adopted, unanimously, the recommendation of the Water Committee, founded on a report by Mr. Eaton, C.E., to obtain a supply of water for the city from the river Gelt, at an estimated cost of £120,000. It is proposed to tap the sources of the Gelt at Gelsdale, the gathering ground being 7,500 acres in extent. The water will be brought in pipes to the existing main at Harraby Hill, a distance of 11 miles. The storage reservoir will be at Castle Carrock, and there will be a service reservoir at Cumwhinton. The supply is ample, and it is probable that the rural districts, or some of them, between Castle Carrock and Carlisle, may, in the course of time, take their water from the corporation. Steps will be taken to promote the necessary Bill in Parliament during next Session.

DOUGLAS.—The Douglas Town Council at their last meeting adopted a report of the water committee that it is desirable that additional water should be provided at the earliest possible opportunity to meet the rapidly-increasing requirements of the borough. To do this the committee recommended the adoption of a scheme of Mr. G. H. Hill, civil engineer, of Manchester, to provide a new reservoir in West Baldwin, at an estimated cost of £49,000. The proposed new reservoir will store 300,000,000 gallons, compared with 105,000,000 gallons in the reservoir at Kerrowdhoo, which was the alternative scheme, at a difference in cost of £1,500. The council voted unanimously in favour of the recommendation, and the town clerk was authorised to make application for legislative authority for carrying out the scheme.

OLDHAM.—The formal opening of the new sewerage works for the town of Oldham took place last week. For some four years the works have been in progress, and they are now practically, but not absolutely, completed. When they were begun it was estimated that the cost would be about £200,000, but that sum will be exceeded by about £65,000. The effluent obtained will, it is believed by Mr. H. Law (the engineer for the committee), be satisfactory to the Mersey and Irwell Joint Committee. Oldham is peculiarly situated on several hill-spurs, with their consequent depressions or valleys, the highest point in the borough being 1,225ft. above the level of the sea, and the lowest 350ft. It has within it 71 miles of sewers, which are all connected or in process of connection with a sewer 10½ miles long. The sewers vary in size from 12in. to 6ft. at the outfall works. The depth is from 10ft. to 160ft. below the hills. The average depth is about 40ft., and the greater part has been in tunnel, necessitating 62 shafts. With such depths underground it is necessary to have substantial work to stand the pressure above, especially in view of the different natures of the ground to be passed through, varying from flowing quicksand to hard rock, and also to disturb as little as possible the buildings *en route*. The most difficult part, that of going under Platt's works, with heavy machinery above, and within a few feet of a chimney, was surmounted without disturbance, and with only a very little damage. The committee decided, after consideration, to make the sewers of concrete. Their experience was that it was not a cheap way of making them, but it was an exceedingly strong one, far better than the ordinary way, and specially adapted for their requirement of strength and solidity. Oldham is said to be the only town that has made such a length of sewers in concrete, but the conditions are exceptional. The works are also constructed in concrete, and an automatic means is adopted to raise the sewage from the low-lying parts of Hollinwood, which is below the level of the works. The effluent, after leaving the works, is treated on 72½ acres of land. As the land is water-tight, 18in. deep of the land has been excavated and filled with screened engine ashes and with drain tiles at the bottom, to drain it to a point where a valve is fixed. These filters hold each 120,000 gallons. The work is exceedingly simple, and only cost about £600 per acre, while it complies with the Government's stipulation of using the land.

The work of extending the pier at Walton-on-the-Naze was begun on Monday in last week.

The memorial stone of a new Constitutional Club at Harwich was laid by the Countess of Dalkeith on Saturday. The building is English Renaissance in style, and will occupy a site of 93ft. by 78ft., and will cost £3,200. Mr. James P. Alison is the architect.

Mr. Alderman Booth, who will be the Mayor of Southport for the ensuing year, is a well-known artist. He is a member of the Royal Cambrian Academy, and was for some time art master at the Bradford Technical College, and fills a similar position at Wigan at the present time. He was one of the founders of the Art Exhibitions at Southport, has been a member of the Southport Town Council for twenty years, and also occupies a seat on the borough bench.

Our Office Table.

THE Cambridge Town Council, judging from the published report of their meeting last week, and from what transpired previously, seem to be making a sad muddle over the erecting and finishing of their Municipal Offices and Guildhall. The undertaking has been in hand for some years on and off, one project after another being advocated and partially carried out. Mr. Wm. M. Fawcett, F.S.A., the architect, carried out the first portion of his plan, which was in its turn based somewhat upon previous ones. His design for the front block of buildings was exhibited at the Royal Academy in 1893, when we illustrated a view of it (Jan. 6, 1893). Recently, however, a far larger project has found supporters, it being contemplated to extend the site and inaugurate a more complete scheme in harmony with the advice given to the council by their architect years ago. Somehow or other, for reasons not evident to those unacquainted with the internal differences which have divided the counsels of the promoters on this subject, the position of Mr. Fawcett became modified, and it seems to be becoming invidious, for Mr. John Belcher was appointed for a given agreed fee to prepare a new elevation and report. This has been done, and the meeting to which we refer was called to consider his scheme. He proposes to remove all the present buildings north of the Hall, and recommends the council to build a piazza the whole width of the façade, making a long colonnade for use as a carriage shelter or porte cochère for setting down arrivals. Above is a balcony approached by casements from the reception rooms on the first floor. The style is of the Later Renaissance, to be executed in Portland stone with Colley-Weston stone slates for the roofs. The principal staircase is devised in Sicilian marble, and the estimated cost for the structure is about £40,000. However, in the end, the debate resulted in the withdrawal of the motion which the Mayor had proposed in favour of adopting these plans by Mr. Belcher, and the amendment, as the substantive motion, was carried, so that, for the present, the matter is relegated to limbo possibly, and, in any case, the result must be far from satisfactory to all parties. The council seem to have two different architects, both members of the Council of the Royal Institute of British Architects, and the promoters, who, perhaps, "might be happy with either were the other dear charmer away," have both architects on their hands. The Mayor stated one reason why he favoured Mr. Belcher's scheme, as being due to his anxiety to confer a benefit on posterity, but the voting which followed the discussion indicates a contrary opinion among these Cambridge worthies which apparently accords with the Irish M.P.'s question, "What has posterity done for us, gentlemen, so why should we provide for posterity? Sufficient unto the day is the evil thereof." The Town Council will probably bring the matter up again some day; they cannot leave it where it is with credit to all concerned, particularly if justice is to be done to Messrs. Fawcett and Belcher.

THE City Corporation has had another great windfall for its Guildhall Art Gallery, in the form of the gift by Mr. D. P. Sellar, of Brentwood and Kirremuir, of a collection of 200 pictures by old Dutch, Italian, and English masters. The generous donation has been gratefully accepted, and the Lord Mayor will go to see the pictures with Sir E. J. Poynter early in November. The gift will hasten the consideration of the urgent necessity of providing a larger and more suitable gallery for the reception of the Corporation's art treasures.

THE engineer to the London County Council has informed the highways committee of that body that there are some cracks in the Queen Victoria-street subway near the Mansion House and also at the Blackfriars end, caused apparently by the execution of works at a lower level, but he states that it is as yet impossible to fix with any degree of certainty to what extent the subway may be affected. The committee, recognising the fact that there are in the subway both water and gas mains, have informed the companies owning them of the circumstance, and that special facilities would be afforded them for the protection of their mains. They have thought it necessary, in order to insure swift detection of any danger of the mains being interfered with by any further subsidences, to have them kept constantly under observation, and for this purpose to employ watchmen both by

day and night, and they are informed that it has also been necessary to retain after the usual hours the subway inspectors, who have special knowledge as to the mains in the subway. The committee think it probable that the cost of the supervision may eventually be recovered, and have instructed the solicitor to take any steps he may consider necessary to safeguard the council's interest in the matter.

With regard to the recent action of the Birmingham Corporation in throwing overboard the recommendation of the committee to intrust the planning of the proposed new asylum to Messrs. Morton and Chamberlain, and deciding to obtain plans in a limited competition, as reported by us last week, page 541, "A Bristol Architect" of nearly 40 years' standing writes supporting the action of the committee. He says that, in his judgment, speaking as one intimately concerned during the whole of his practice with the working of competitions, the Birmingham Asylum Committee exercised a most wise discretion in setting their faces resolutely against that system for the new buildings, and for the following reasons, which were, more or less, doubtless, present to their minds:—(1) That no branch of the profession other than asylum planning has got more completely into the hands of a select few, and those about the most extravagant and careless as regards expenditure to be found in the whole of London; and (2) that it is better, all things being fairly equal, not to go out of Birmingham for plans and superintendence. He adds that he could give proofs of the inner working of these competitions, which, in nine cases out of ten, have had a distinctly unfortunate result for the public purse.

UNDER a Parliamentary Bill the St. Anne's-on-Sea Urban District Council have carried out a great improvement to the beach, which for many years was but a barren waste of sand and pools of water. St. Anne's has only been in existence 21 years. The front formerly belonged to the St. Anne's Land and Building Company, but the council, under an Act of Parliament, acquired it. The works, which have been of a costly character, have been in progress since January last, and are now completed. Prior to the commencement of the work there was opposition from the residents on the front, but, now that the work is completed, it is found that the mounds, &c., do not interfere with the outlook from the houses on the front, as was at one time feared. The old narrow promenade has been considerably widened, and along the whole length rockery has been placed to a height of about 5ft. On the inner side of the rockery earth has been banked up and trees planted. Lawns intervene between these and the roadway, and they are to be used for tennis and children's playgrounds. Shelters, fountains, and bandstands have been built, and the work has entirely altered the appearance of the front.

THE Science and Art Committee's report upon the administration and cost of the museums of the Science and Art Department, issued on Saturday, calls attention, as had been anticipated, to the danger of destruction by fire to which the priceless collections at the South Kensington Museum are exposed. The committee regard it as their immediate duty to lay before the House of Commons their very strong opinion that permanent buildings for the adequate accommodation of the collections at the South Kensington Museum should be proceeded with without delay. They are of opinion that it will be a source of grave discredit to the country if the settlement of this matter, which has been the subject of consideration by Governments for many years, and of endless correspondence between the departments concerned, is any longer delayed.

MR. C. H. BRODIE, F.R.I.B.A., of 17, Southampton street, W.C., writes a warning note in Monday's *Times* as to the risk of a similar epidemic to that now raging at Maidstone, which is, he alleges, almost invited by the drainage arrangements in North London. This district is, he says, served by a main sewer of the London County Council, which takes the drainage of part of Kilburn, in the county of Middlesex, by means of branch sewers. In times of heavy rainfall the volume of water coming down from the higher ground of Humpstead, &c., not only prevents the Kilburn drainage from passing away, but forces the sewage from the main sewer up the branch sewers and drains, and frequently causes both storm water and sewage to rise in the basements of certain houses. This has happened twice this year, and in the last great storm of September 29

the houses were flooded with the storm water and sewage to a depth of 15in. to 18in. The Willesden authorities state that, although very desirous to prevent it, they are helpless in the matter, and that the remedy lies with the London County Council, whose main sewers are of insufficient capacity to properly drain the district.

A CONFERENCE of representatives of the Poor-law Unions of Cumberland, Westmoreland, and the North Lonsdale Division of Lancashire was held at the County Hall, Carlisle, on Friday, to discuss the proposed establishment of a joint asylum for imbeciles and epileptic poor. The chair was taken by the Rev. A. F. Carwen, chairman of the Whitehaven Union, and nearly all the unions were represented. Mr. Jenner-Eust, Local Government inspector, was present. After some discussion it was agreed to appoint a committee, consisting of a delegate from each union desiring to join in the scheme, for the purpose of obtaining information, and draw up a report to be submitted to the various boards of guardians. In reply to a question as to where the institution was likely to be built, the Chairman mentioned Threlkeld, near Keswick, as a convenient centre, land being cheap there, water good, and the district healthy.

PEOPLE passing along Princes-street, Edinburgh, have recently been surprised, says the *Scotsman*, to see what appeared to be a new structure on the face of the Castle Rock. The structure in question, however, is not a new one. It is, in fact, the old masonry platform on which was reared a derrick or crane for lifting water-buckets from the tower of the well-house beneath, and has thus come to be called the "Wallace" (properly well-house) cradle. This was the only supply of water available for the garrison. This ancient relic of the time when the Castle was a fortress had gradually become disintegrated and unsafe. It has now been repaired by the division officer in charge of the Castle buildings. Not a single stone has been moved out of its place, and the joints have been filled with cement mortar. The repairs have, unfortunately, given the structure a new appearance, but in a year or so the smoke of the valley will no doubt tone it down to the colour of the rock. To the west of it, the buttress of the picturesque watch-tower at the angle has also been newly pointed.

MR. JOHN H. JAMES, M.S.A., who gained silver medals from the Royal Society of British Architects and in the National Competition for his measured drawings of Llandaff Cathedral, has now written a complete history and survey of that building, the greatest of the four Welsh Cathedrals, which is to be published by the *Western Mail* Publishing Company. Numerous illustrations will be given, including a plan, elevations, details, and sketches in full-page and double-page plates. The book will be printed and finished on cream vellum (size 12in. by 10in.), and bound in holland with a design on the cover in gilt and colours. We published some of Mr. James's drawings which will appear in the "History and Survey of the Cathedral Church of Llandaff" in our issues of July 12 and 26 and August 2, 1895.

THE annual statement of exports from Aberdeen to the United States for the year ending Thursday in last week has now been made up by Mr. Andrew Murray, Advocate, U.S. Consular Agent for the Aberdeen District. From this statement it appears that there is a decrease for the year over all in the value of the exports of about £2,000. The total value of the exports for the year amounts to 413,802dol., as compared with 423,165dol. in 1896. The striking feature in the returns is the very large falling-off in the exports in polished granite. In 1896 the value of the polished granite exported was about £55,452; this last year it has fallen to about £37,000, or a decrease of the large amount of about £18,500. It is another serious feature of the returns that the granite exports have been smallest in the quarter just ended, as indicating that the trade is still on the downward trend. For the quarter ended 31st December last year the exports amounted to fully £10,000; for the quarter ended 31st March last to about £7,200; for the quarter ended 30th June to about £12,700; and in the last quarter the value went down to a little over £7,000. The increase in the American tariff is the most obvious cause for the falling-off, and coming as it did upon an article on which the margin of profit was rapidly becoming a disappearing quantity, this latest increase has been seriously felt. But the growing development of the American native quarrying and stonecutting

industries has tended to the repression of the Scotch export trade; and particularly would this be so in the face of the combined extensive use of foreign granite by Aberdeen manufacturers for American orders. The returns now to hand call for the serious attention of Aberdeen merchants, if the American branch of the staple industry of the city is to continue in a prosperous and healthy state.

CHIPS.

Mr. Harrison Later, the arbitrator between Messrs. Watson and Wilson, contractors for certain works at Lake Thirlmere, and the Manchester Corporation, has been sitting for the past fortnight to hear evidence. The contractors' case is not yet finished, and no estimate can be formed as to the date on which a decision will be arrived at.

At Magourney Church, near Cork, a carved oak communion table was dedicated last week. It is Perpendicular in style, is 7ft. long by 3ft. 3in. in height, and is divided into three compartments. Messrs. Harry Hems and Sons, of Exeter, carried out the work.

The large block of flats and shops which is being completed on the site of Heath Lodge, 514, Wandsworth-road, Clapham, S.W. (now known as Heath-terrace) has been executed from the designs, and under the superintendence of, Mr. T. E. Lidiard James, F.R.I.B.A., of Lonsdale Chambers, 27, Chancery-lane, London, W.C. The contractors are Messrs. Holloway Bros., of Victoria Works, Queen's-road, Battersea, and Mr. J. C. Lewis has acted as clerk of the works.

Messrs. White and Sons, metal workers, of 207, Oxford-street, London, have erected in the church of St. Alban, at Birmingham, a light, but very beautiful, iron chancel screen, from the designs of Mr. J. L. Pearson, R.A., a gift to the church by his wife, in memory of the late Mr. James H. Mole, one of St. Albans' warmest friends and benefactors, and for some time churchwarden. The screen consists of five arches resting upon a chancel wall. The central gate is surmounted by a large light iron cross. The ornamentation throughout is in wrought iron ribbon scroll work. An artistic feature of the new screen lies in the great variety of design displayed in the almost innumerable scroll terminals, no two of which appear to be alike.

A new peal of bells and a clock were dedicated at the parish church of St. Vryan last week. The work has been done by Mr. Stokes, of Woodbury, and Mr. Cornish, of Plymouth; the former being contractor for the bells, and the latter for the clock. The bell-chamber was entirely gutted, new oak beams, floor, and oak frame for six bells being fixed in the place of the old decayed timber. The three old bells were sent to London to Warner's foundry—two to be turned and one to be recast; the firm also cast three new bells to make a peal of six.

The corporation of Wolverhampton a short time ago decided to pave certain streets with wood blocks; and during the past week Mr. H. Holloway, contractor of that town, has been engaged in preparing a portion of Dudley-street for the change in the character of the pavement of the thoroughfare. On Monday morning the first wood block was laid by Alderman T. V. Jackson, the chairman of the public works committee, to whom was presented a silver-headed axe, bearing a suitable inscription. A portion of North-street and Stafford-street will also be laid with wood blocks.

A London syndicate contemplates erecting at Newquay a promenade pier, with a pavilion, landing stage for steamers and boats, the pavilion to be used for entertainments, skating, &c. The engineer is Mr. Robert H. B. Neal, C.E., of Plymouth, who had received instructions to make a survey and report.

On Friday, at Hull, Col. W. L. Coke, M.I.C.E., Local Government Board Inspector, held an inquiry into the application made by the city corporation for sanction, under a local Act of last session, to an agreement for the purchase of the undertaking of the Kingston Gas Light Company. The town clerk, Mr. E. Laverack, said that Hull was supplied by three gas companies, the Kingston being the oldest, and situated in the heart of the city. The price agreed upon between the corporation and the company was £92,500, figures which were based upon an average of the company's profits, which last year amounted to £4,976. The purchase was really part of a scheme by which they hoped to dismantle the works altogether, and make a new street through the area. A local solicitor objected to the amount of the purchase money as exorbitant. Ald. Massey, chairman of the gas committee, gave evidence in support of the scheme, as did also Mr. F. J. Bancroft, waterworks engineer. Mr. Newbiggin, of Manchester, said that if he had been engaged by either of the parties directly interested to make a valuation, his price would have been £115,000. The inquiry was closed.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2234.

FRIDAY, OCTOBER 29, 1897.

TWO QUALITIES OF WORK.

THE virtues of honest design and construction are often obscured by the means undertaken to attain them. We place before us an ideal of transcendent beauty, which we then proceed to deface or rob little by little, that at last nothing is left of the original. A well-conceived design, say, for a municipal building is prepared by the most skilful of architects; but before it enters upon the contract stage the process of degradation has been steadily at work. The draughtsmen have unconsciously done their best to rob the design of all the spirit and freshness which it possessed when it left the pencil of the artist; slight changes of proportion have been made in the façades and salient features; the tower has been spoiled of its contour; the mouldings have suffered in their profiles; cornices and projections have been reduced, and sculptural ornament has been denuded of its boldness and accentuated relief, and all this change has been simply due to the redrawing to a larger scale of the original sketch. The accents of touch due to the pencil of the artist are lost in the scaled geometrical drawing in a flatness of treatment or a dull level of draughtsmanship. Or it may be "a ghost" has produced a design which cannot be sustained in the actual building where materials have to be treated, and practically the scheme undergoes so complete a change, that what was, at least, artistic in conception gives place to a very ordinary and commonplace building. There is often much that is impracticable in the drawings of architects' details that have to be altered or modified in the execution; but we are not now speaking of this, but of designs which, by the process of reproduction lose their character and intention. Then comes the still more destructive process of making the drawings square with the bill of quantities. Alterations and a general "cutting-down" follow, to the dismay of the architect. Even if the working drawings are not left to the quantity surveyor to modify and alter to suit his bill, the change actually takes place, for it is the bill, and not the drawings, that is followed. Imagine such alterations as these: brick substituted for stone, reduction in thickness of walls, cornices cut down in projection, three-quarter or whole columns struck out and pilasters substituted, the curtailment or mutilation of all details and joinery throughout the building. Thus reduced and pared down, the design of the architect is ready for tendering. It is now, in the pages of the "quantities" at least, a mere ghost of its former self; the whole life is taken out of it, but as yet the owners and the public know nothing of what has been done on paper. The next step in the process of degradation is left to the wily contractor. One thing is specified, another thing is contracted for, and the dual nature of the transaction is sometimes shared in all round by owner and architect, by architect and contractor, and by contractor and sub-contractor or manufacturer. Each is ready to profess one thing, and do another. Have we not heard of the architect accepting illicit commissions from the contractor and tradesmen?—and what is this but specifying with one hand for the best and with the other accepting a bribe for an inferior article? Happily this kind of dishonesty is not common, but it sometimes takes another and less objectionable form. The acceptance

of the low tender can only mean one of two things: the desire to take advantage of the builder in a pecuniary sense, or a compliant attitude towards him in the passing of his work, which is scarcely honest to the client. In short, the architect is willing to accept an inferior article, though he has specified the best. When the lowest tender is taken it means generally that there are two qualities, or that the specification is elastic enough to accommodate both—a kind of duality of conscience that is very objectionable, to say the least. But it does not end here; the contractor and the manufacturer resort to the same thing for their mutual advantage. The lowness of the tender has to be made up in some way. The conciliation of the architect is one means; another is the practice of getting the manufacturer to quote a low price on the understanding that the high quality of the goods described will not be demanded, or that another tradesman will bid lower. The way this is done has been described. The trading firm is placed in opposition to a competitor in the same trade, who is willing to supply the goods at a reduced price, but the quality of the goods is kept secret. Thus the inferior article is placed in competition with one of superior merit, and the deluded tradesman reduces his price accordingly. This practice can be at once checked if the architect specified with more fulness, and supplied more detail, or insisted on samples of quality being submitted with the tender. In the manner we have described, it becomes easy to substitute workmanship of a quality very different in kind to that which has been specified.

Everyone knows how very hard it is to maintain the standard of quality in certain materials and workmanship, and there are several ways of subverting the specifications and drawings. To take such a material as brick. With the several varieties of clay and manufacture on the market, it is impossible to insure a delivery of goods always up to the mark. Imperfectly-burnt place-bricks and grizzles find their way into the building, even when the clerk of the works is on the alert. Sappy deals and battens and shaky timber in balk are surreptitiously introduced; cast iron of inferior quality; castings like pillars and girders find their way on the work that are not without blemishes like air-holes and cracks; stone with vents and veins, intended for piers and to bear heavy loads, is delivered. In such cases the samples afford no guarantee, but are merely a pretext to blind the architect who relies on them too implicitly. Sub-contracting also has in some instances made it easy to circumvent the architect's intentions by doing away with the personal superintendence of the contractor. The usual clause which runs, "The contractor is not to sublet the works or any part thereof without the consent of the architect," is, no doubt, a useful proviso to keep the contract in the hands of one person, and yet it is sometimes beneficial to let the work to someone who is more skilled, as for example, an engineer for heating or ventilating, an artist for the supply of stained glass or metal work, or for decoration. Whichever way it is, the question should be decided by the architect at the initial stage of the work. If the sub-contractor enters into an agreement with the contractor to execute the particular work, providing all materials, and to complete the same in accordance with the plans and specifications, indemnifying the general contractors from all loss and damages which may be sustained by the latter in consequence of his own neglect, there would be little harm done; but the fact is that contractors who make low offers sublet portions of the work without consent, and often without any binding agreement between them, so that the architect has to deal

with more than one party without satisfactory redress, much to the hindrance of the building and to its disadvantage. Let us imagine a case where the contractor has sublet the labour of the brickwork. The architect finds fault with the pointing; many of the joints are left unfilled with mortar, or the prescribed quantity of lime is not used. He appeals to the contractor, who is the responsible party, and he in turn to the sub-contractor, and there the matter ends. No correction is made, and all the architect can do is to make a deduction, if that is possible. If it is the carpentry and joinery, or the plumber's work that is sublet, the affairs become more vexatious and troublesome, and any restitution, if demanded, threatens arbitration or litigation.

The profession are not altogether exempt from blame. Detail drawings are often made in excess of the contract and quantities, and the contractor derives a double advantage by objecting to carry them out, for he not only scores a point by showing their excess, but he is enabled to take advantage by substituting inferior materials. The builder says he cannot execute a detail for a casement window which shows thicker frames and a more elaborate system of jointing than he tendered for; but if prevailed upon to carry it out, he omits something equally important, and puts on an inferior weather-fastening to the casement. When will the architect learn the lesson of preferring the plainer way of doing a thing, which is more likely to be executed with care? How often an architect tries to insert a piece of ornament or carving; but how little he thinks what he gains by winning over the builder to carry it out! Something else is omitted: the builder takes care that he shall not lose by it. Perhaps another extra enrichment in a cornice, but at how great a cost!—inferior timber or bad door fastenings—and so it is throughout. The "give-and-take" principle does not answer when the building price is low all round—when everything is cut down to the finest. So long as the desire of the client is to obtain a larger quantity of work for his money than is either honest or straightforward, we cannot wonder if the contractor does his best to obtain his share by no less unscrupulous means. When tendering is no longer a kind of mock auction confined to men who try to win by undercutting a fair profit, when a tender is only submitted on an identical basis and a clear understanding of the designer's intention, these drawbacks to good architecture and building will disappear.

ROYAL SOCIETY OF BRITISH ARTISTS.

WITH much that is average, we have here a number of works which mainly are experimental or imitative of "advanced" schools; but even these latter are more to be desired than the commonplace and nauseating sentimentalities which pander to the public taste and overwhelm the picture market. In the central gallery of the Suffolk-street institution several landscapes, sea, and river-scapes are hung. One large contributor is Montague Smyth. "In the Fen Country," a dark, misty effect, the vein of much of this painter's landscape work, always naturalistic, but never commonplace. "Across the Dunes" (35), "Homeward" (40), "On the Quayside" (212), "Bathing Time" (221), are all honest and sympathetic renderings. Tom Robertson's luminous seascape, "On the Ayrshire Coast" (10), and "The Way to the Farm"; "Evening Glow," by Adam E. Proctor; "Yarmouth Trawlers," by G. S. Walters; an evening effect by J. Sanderson Wells (21) are a few other works which rise above the average level. To pass for a moment from landscape to the imaginative. What is to be said of

F. Cayley Robinson's allegory, "The Return of Spring"? We have on former occasions spoken with some pleasure of the work of this promising artist. There is always a quaintness and poetic symbolism in it. In this picture we have all the elements of a fine idea, but spoilt by the utterly dejected and inanimate-looking maidens who are floating in mid-air down the courtyard of a Mediæval castle, dropping from their hands daffodils. Grace and rhythmic motion are undoubtedly present in Mr. Robinson's composition; the warmly-lighted dormitory window, through which a young mother is seen in bed with her new-born babe, and the many signs of a regeneration of nature and of life are evident; but the grotesqueness of the drawing is carried to an extreme. A clever and humorous figure-study is H. M. Liven's "A Lesson in Anatomy," an elderly Frenchman or professor holding a wooden-limbed doll, with which he is illustrating his lecture (23), is at least fantastic. His other subjects, and his figure of a man, pleased, but helpless under the influence of drink—"Where Ignorance is Bliss," &c. (208)—are simple but clever satires. Abbey Altson sends a figure-subject, "Meditation," well drawn, in the figure of a girl in black leaning on mantelpiece before a small five-o'clock tea-table, in the glow of a lamp. J. W. T. Manuel's small figure-sketches, though slight in colour, are brilliant and spirited—especially his "Etoile de Paris," a bright and vivacious danseuse. S. M. Laurence's "Kynance Cove" is broadly handled, and the colour of sea and rock fresh. Arthur Ryle's vigorous landscape sketch (29) is a clever impression. In a few dashing strokes of colour he gives the effect of light on the wild moor and the dark stormy clouds. More finished is Arnold Helcke's "Sunshine after Rain," cattle watering at a brook. Over the fireplace a few pictures arrest attention, but of an ordinary kind. A large landscape in the centre—"A Summer's Morning"—represents a small harbour. The bright streak of sea on the horizon and the masts of vessels lying at anchor, are relieved by a large tract of uncultivated foreground. The tufts of furze and rank grass in the latter are well painted. Terriek Williams' "A Sunlit Sea" (52), is luminous, the atmosphere and sunlight admirable. Near it a bold and vigorous picture by F. A. W. T. Armstrong, "The Torrent," must be noticed; a torrent from some mountain side is sweeping down with relentless force, carrying debris and trees in its devastating path. His other works—Coombe Dingle, Bristol and Lake, Capel Curig—are forcible "notes" or sketches. A small delicately-painted study of a girl adjusting a necklace, seated on a marble bench in a colonnade overlooking the sea, has a Tadamaesque setting; but it lacks tone. A child study (54), by G. Hill-yard Swinstead, is gracefully painted. Another clever figure subject by Adam E. Proctor's "Three Generations," is a group of gipsies seated round a large cauldron of boiling water. In the sunlight behind are a whirligig and other attractions of a country fair. Fresh in colour is Alfred S. Edwards's coast view "The Birthplace of Cuyt" (60), and a pleasant girl's face is N. Prescott-Davies' "Sun Kissed."

Sir Wyke Bayliss, the president, contributes a splendid interior of "St. Peter's, Rome," showing an evening effect in the vast basilica. The perspective is taken from a nearly central position in the nave, and the lighted dome with the great central high altar under its baldacchino closes the vista. The gleaming light on the mosaics and marble pavement, and the panels and arabesques of the piers and arches, is enhanced by the sombre shadow tones of the arcades and vault, all painted with inimitable skill. The scarlet of the vestments in the procession add brilliancy to the scene.

His other great interior is in the N.W. Gallery, and represents Amiens (234), a still more successful feat of drawing and colour. The darker masses of screens and stalls give effect to the lofty nave bathed in light of jewel-like richness and tone.

In the centre position on the long wall is a beautiful work by Sir Edward Burne Jones, Bart., a large painted decorative design showing the mosaic subject over the chancel arch in the American Church of St. Paul's, in Rome, set up in 1893. Sir Edward has here exhibited the great powers of his imaginative genius. The subject is "Christ upon the Tree of Life." The composition is in every way dignified and original. The centre figure of Our Saviour is seen at the apex of the pointed arch, springing out of a conventionalised tree, whose root rises from the crown of arch, and whose branches ramify in beautiful curves bounded by an outer arched form. A landscape occupies the space directly over the arch. The outstretched arms of Our Lord give the form of the Cross to the central figure, though the artist dispenses with the Crucifix itself. On the left side (right of the Saviour) is Adam, typical of man; on the other side stands a graceful figure of a woman, holding Abel at her breast, Cain clinging to her skirts. These figures stand on a lower level, over the haunches of the arch, and in the landscape. At the side of Adam is a sheaf of wheat, and by the side of the woman a lily as the emblem of purity. Nothing can be more dignified, and while it is strictly symbolic, it is also decorative. The figures are devoid of archaic stiffness, and that of Christ is dignified and pathetic. The scheme of colouring on the panel is in a low key, and in blue of subdued shades. The portrait of the President, by T. F. M. Sheard (93), is characteristic as a likeness, and well painted, though we cannot say the personality is realised. J. Fitz-Marshall's "Disputed Territory" (64) is clever—a pup and kitten disputing possession of a chair. Henry Thos. Schäfer's "Fairer Than Morning," a study of a girl in light drapery; the amber tones in T. Robertson's "On the Lagoons" (75), W. Peter Watson's "An East Anglian Port" in Norfolk (71), a clever sketch by Val Davis, "The Path" (69), the large landscape by A. Meade, "Morn" (96), tenderly painted, John M. Macintosh's harmony of colour "Red Osiers," and Stuart Lloyd's "Haunted House" (130) may be named. Leonard Watts's study of a girl at prayer, "Ora Pro Nobis" (113), is handled with feeling.

In the other galleries a few pictures deserve a passing notice. "Meditation" (138), by Joseph H. Bentley, is a nice study; there is some cleverness in G. A. Holmes's "A Study in Natural History" (139), also a large landscape (147), a winding river passing through misty meadows, by Fred Milner, and the admirable colour in Alfred S. Edwards's "A Fisherman's Haven" (150). Robt. Goodman's "Early Harvest" is strong in its colour and tone, the sunset effect and the blue clouds rising are painted with much feeling and firmness. W. Ayerst Ingram's ambitious seascape "Evening," is feelingly painted. Hal Hurst's study of a girl holding violets and wearing the same flower in her hair, is delicate and refined, and his work, "The Spirit of the Water Lily" (177), an idealised study of a nude figure seated on a bough of a willow tree over a placid lake with water-lilies, is an ambitious work for a young member. The drawing of the figure is graceful, and the colour delicate.

Mr. G. H. Sime's work, too, is promising; his portrait, a full length of a lady in shades of heliotrope, standing against a light blue curtain, is an experiment in colour. Another lady's portrait, Mrs. W. Simonds, by J. Sanderson Wells (163), is a more finished example, and the colour scheme of white satin and brown against a rich blue background is pleasing. Sir Wyke Bayliss has a

charming little interior of St. Marks, Venice. One or two spirited works are seen in the S.W. Gallery. J. W. T. Manuel is daring in his garish picture "Rosherville," a motley gathering of East-Enders, 'Arries and 'Ariettes, soldiers and sailors and their lasses, on a vivid green lawn surrounded by statuary, &c. The chief note of contrast is the vivid blue dress of a girl and her sailor lad. The work is strong enough for a signboard as regards colour. The picture by Wright Barker, "Ambition" is a masterly horse study; two unharnessed horses catch sight of galloping hunters through a field, one of them is restive, and with frenzied eye is held with difficulty. "The Lonely Road" (200), by S. H. Sime, is a dark country road by a churchyard; beyond are the flickering lights of a city. A gentleman and lady in evening dress are walking home; their figures by moonlight cast a weird shadow on the road; but there is more—the work suggests fearfulness. "A Night Out" (210), by R. Ponsonby Staples, is painted with considerable force. The crowd of playgoers in evening dress seated round the stage of a theatre is full of animation. A young lady in front stalls dressed in a low-cut silk dress and the elderly *habitué* by her side are drawn with much expression. Above it Oscar Eckhardt sends another study of London life in "Artificial Ice," a good title for the *posse* of ladies in fashionable hats and capes, who are looking at skaters on the rink. The large, almost graceless, picture of "The Annunciation" has little that can suggest such a theme; the cold colours are unpleasant. "Hallow E'en," by R. Gemmell-Hutchison, is a work of some power.

The North-west Gallery (water colours) has a cleverly-conceived subject, "Touchstone and the Shepherd" (215), by John Eyre, brilliant in colour; near it W. Lee Hankey's "A Full Tide" is broad, and there are liquidity and reflected light on the water; H. Sylvester Stannard has a fine marsh or river-scene broadly handled (218). Frank Spenlove-Spenlove sends a richly-coloured pine-wood subject, "The Golden Hour" (219), "Early Morning, Dordrecht," in nice tone, and several other drawings. Geo. C. Haité has some delightful sketches in broad simple washes as "The Bridge," "A Country Road," "An April Shower" (295), "Apple Auction," all brilliant and natural. W. Harding Smith is a contributor of several good works; amongst these we notice his "Sunrise, Venice" (223), "Emmanuel Hospital, James-street" (280). Of other works, we can mention only those of Albert Kinsley, a view of Margate from the West Beach (226); of W. H. J. Boot (250); and R. Machell's allegory "The Kingdom of Heaven is Within You" (274), chiefly clever as a symbolic and decorative design. Oscar Eckhardt has a bright figure study, "Roses, Roses all the Way," a lady driving amidst a shower of roses, and another subject on the screen by W. Lee Hankey, a girl in a stubble field (314), is worth notice for its simple treatment.

LESSONS FROM THE PARIS CHARITY BAZAAR.*

INTRODUCTION.

I PROPOSE to recall some of the facts of the recent Paris Bazaar Fire, and I shall be doing so, gentlemen, before the members of the profession with whom to a great extent will rest the responsibility of future catastrophes of this description. Great Britain alone has an approximate total loss of property by fire of seven million pounds per annum; and remember, this is an absolute loss of the nation's wealth, and the wealth of the communities concerned. The annual

* By EDWIN O. SACHS, F.S.S., Architect. A Paper read before the Architectural Association on Friday evening last. (See report of discussion on p. 610 post.)

loss of life is very heavy, and the number injured exceedingly large. Now, quite apart from sentimental reasons, is it not very curious that in such a practical country as ours we should allow this constant drain on life and property, and, what is more, allow it to a far greater extent than is the case in several other countries which are by no means so businesslike as we are, and are certainly not doing so much to prolong life as we do in this country? You know it is the old saying that "laws are made to be broken," and I am sure many of you pride yourselves on your "cuteness" in having found some outlet, some makeshift or excuse, for avoiding some of the few requirements laid down by the public authorities in this matter of safety from fire. Oh, gentlemen, we all know how proud the architect is when, say, he has a factory case, with the lives of hundreds of employés involved, and he can go to his client and say: "Sir, I have saved you that emergency staircase which figured so prominently on your schedule"; and mentally, perhaps, he thinks of the extra twenty-five guineas he will get for his successful negotiation. We know, gentlemen, how proud the theatre architect is, when fighting against some long list of requisitions, he can point out to the lessee: "I have saved you that exit; I have saved you that reduction of seats"; and, maybe, he also thinks of the extra fee, but certainly he never—any more than the architect with the factory case—gives a thought to the lives of those who enter the building on which he has advised. Don't let me be misunderstood, gentlemen; every architect not only has the right but the duty to express his opinion on the requirements or requisition with which the public authority wishes his client to comply. But I consider it reprehensible, nay, wicked, to oppose every regulation for the safety of life and property, for the mere sake of opposition, and for the mere sake of pleasing one's client. Study the requisitions conscientiously, and if you find exaggerated demands on the part of the authorities—mistakes, faddism—certainly try your best to get your client out of spending unnecessary money. If the authorities know you to treat matters seriously and fairly, you are sure to have far more consideration given to your arguments than if the reverse is the case. But, again, don't oppose for the sake of mere opposition, or because it is the fashion to try to "best" the authorities.

THE PARIS BAZAAR BUILDING AND THE FIRE.

After these preliminary remarks, let me give a few facts about the Paris Bazaar fire, and the construction of the building which was the scene of the holocaust. Firstly, it should be noticed that the scene of the catastrophe was in a temporary structure used for theatrical purposes. Both the stage and seats had only been removed to enable the structure to be adapted for the organisation of a charity bazaar. Next, it should be noted that the site of the building (Fig. 1) was in the Rue Jean Goujon, close to the Rond Point of the Champs-Élysées on the one hand, and to the Cours La Reine on the other, and hence it was situated in a much-frequented part of the city. It was not hidden away in some back garden or placed in some outlying suburb. Roughly speaking, the ground has a frontage of over 90 metres, or nearly 300ft. Its depth averages 45 metres, or 150ft. Nearly 80 metres of the frontage was taken up by the temporary building, the average depth of which was 13 metres, and there were several small additions to the back—namely, a refreshment-room, a large store-room used at the time of the catastrophe as a cloak-room, and the fatal cinematographe-room. The last-named annexe, which will be seen from the ground plan (Fig. 2) was not, as far as the plan shows, in direct communication with the main building for entry and exit, the approach being from outside, and the visitors passing through door No. 3. The main building covered about a third of the superficial area of the site, while two-thirds, having an average depth of 32 metres, had not been built on. The site was inclosed on the back and two sides by walls of various heights, from 15ft. upwards, and by the party-walls of some adjoining houses. One of these blocks, the Hotel du Palais, has windows overlooking the ground.

THE PLAN OF THE BUILDING

shows a long gallery constructed of a series of framed trusses, the whole of the work being in timber. All the walls were match-lined on both sides. The roof was partly covered with tarred

felt and partly with glass. The total cost of the structure was about 12,000 francs, or about £480, of which sum nearly half was spent on the materials employed. The contractor carried out the work with particular regard to economy, and hence, perhaps, the lightness of the materials employed. So far as the contractor was concerned, the building appears to have been considered of a private character, little or no supervision apparently being exercised by any of the local authorities. The principal entry was through two doors, placed centrally, No. 1 and No. 2, and the visitors passed through a small vestibule and inner lobby in each case. There were four additional exits at the back, Nos. 3, 4, 5, and 6, of which No. 3 alone seems to have been well known, owing to its forming the approach to the cinematographe annexe already referred to. There was another exit, No. 7, used for service purposes, with which only the management and the stall-holders were acquainted, and there was also a small door from the refreshment annexe, No. 8, into the open. In the front of the building there were several windows to the office, the ladies' room, &c. On both sides of the gallery there were rows of stalls, and the construction of these, together with the section of the building, is shown in the diagram I have had specially prepared from the working drawings in the hands of the contractor. (Fig. 3.) The frontages of these stalls were faced with scenery (Fig. 4), whilst the top of the hall was closed in by a velum of canvas. The decorations were elaborate, and, I must again add, particularly inflammable, while the articles for sale on the stalls were, of course, of a similarly dangerous character. Perhaps I should also mention that the decorations to the stalls were old, worn, and very dry. The floor was of wood, resting on timber sleepers. On the exteriors the only attempt at decoration had been in the central feature.

CAUSE OF THE FIRE.

There is no doubt that the fire originated in the cinematographe annexe, and the actual cause was due to carelessness in using the special lamp employed. It appears that the flames at once broke through to the gallery, and were drawn immediately across the hall to entrance No. 1. It will be seen from the drawings that the glass at the top of the building must have been broken almost immediately, through the enormous velum becoming a sheet of fire. Further, it is evident that the velum must have broken away from the points at which it was hung, falling on those beneath it. The tar on the roof also dropped in a molten or burning state. The plan will explain how those farthest away from the centre on the cinematographe side of the building must have been cut off directly the flames took a hold of the doors No. 3 and No. 1. It was further natural that there should then be a general stampede towards entrance No. 2, and to that part of the hall farthest from the cinematographe. The extra doors, No. 5 and No. 6, were apparently so little known that they were not used, and it appears that many of the visitors were caught at the entrance to the store annexe, which, I have already stated, was then serving as a cloak-room, and, hence, well known to many of the ladies, who, in the excitement of the moment, must have associated it with an exit. In this annexe most of the bodies were found.

DEFECTS OF THE PLAN.

It is not my purpose to discuss the plan in detail; but there is one thing certain, and that is, that at first sight the number of exits, eight in all, would appear sufficient for a substantially-built structure which has its floor on the ground level. There is one unfortunate feature of the planning of the Paris Bazaar I cannot, however, help noticing, and that is the manner in which the lobby to entrances Nos. 1 and 2 were set out with the view of excluding draughts. I am unable to get reliable information if the wings to these doors swung outwards. As to the doors Nos. 3, 4, 5, 6, however, I know that they opened inwards, and that one of them was blocked or bolted at the time of the catastrophe. Looking at the plan of the building, its construction and contents, and considering well all the defects that such a structure must contain, I would yet point out that the extent of this calamity was due in a great measure to the fact that the majority of those present were ladies whose clothes must undoubtedly have caught fire immediately the lengths of canvas velum and burning tar fell.

THE MAIN FEATURES OF THE CATASTROPHE.

To recapitulate the main features of this catastrophe, let me repeat that the building had its floor practically on the pavement level, and stood on its own ground, with its front on a broad public thoroughfare. There was vacant land at the back, a broad passage on the side, and a narrow one on the other. There were eight exits leading direct into the open, with an aggregate width of some 40ft. The visitors were mostly ladies dressed in spring apparel; the spread of the flames was exceedingly rapid, and their garments became ignited almost immediately. The general aspect of the fire was particularly dangerous. There is no doubt that many of the visitors practically died where they stood at the time of the outbreak, being enveloped almost immediately in the burning canvas which fell from above. Of the others who succumbed, many were entrapped either by being cut off from the exit, by finding these blocked when they reached them, or by not knowing their exact position. Of those who escaped by the principal exits, a large number were injured by the crush at the doors. Though the police and the fire brigade were within easy call, even the instantaneous arrival of a large force on the spot could scarcely have lessened the death-roll, owing to the rapidity of the fire, and the extent of the panic. I have not heard of any watchman or fireman having been stationed in the building; but had this been the case, it is not in the least likely that his efforts would have had any appreciable effect. The great heat from the fire appears to have prevented those who reached the land at the back from utilising this space as a refuge. A window at the Hotel du Palais was used by many escaping to the rear of the building, as the broad passage opening into the Rue Jean Goujon was apparently overlooked. A number of the visitors were, however, either killed or badly injured in the crush to reach this improvised means of escape through the window. In closing these remarks anent the fatal building, let me again remind you that no less than 124 lives were lost, and of the injured many even to-day are in a serious condition, or are practically human wrecks, owing to the nervous shock which they sustained.

FIRE-PREVENTION OF TO-DAY.

Now, if I may be allowed to classify, the Paris Charity Bazaar was a semi-public entertainment, held in a provisional building. As you know, our entertainments are either of a private character, of a semi-public, or of a public character, whilst the buildings utilised are either permanent structures specially erected for a specific purpose; permanent structures temporarily adapted for some such purpose; or they are provisional buildings.

SAFETY AT PUBLIC ENTERTAINMENTS.

As far as public entertainments in buildings specially erected for the purpose are concerned, nearly every country has already inaugurated some policy for preventing catastrophes. I hear speak of the theatre, the music hall, the assembly room, &c. Europe has in fact, every kind of legislation conceivable for the protection of the public in this class of structure. There has been hysterical panic legislation, ponderous regulations in which every detail is defined by law, also codes which leave practically everything at the discretion of an executive of experts, and regulations which are merely so by name, and are a farce because they cannot be put into force. There is no uniformity in the preventative legislation of the world, even in its elementary principles. I am not going to raise the many questions as to the proper executive for locally determining or enforcing the requirements, nor shall I enter into the merits of individual regulations. I will simply call your attention to the want of uniformity in the main and elementary principles for obtaining safety where we have to deal with buildings erected for specific purposes and where specific forms of entertainment are given. Personally, I hold that, for a theatre or music-hall, clear planning is of greater importance to the audience than clever forms of construction, or the employment of materials having considerable power of fire-resistance; and, further, I contend that in such buildings the regular attendance of fire-watches day and night, and more especially during performances, is more essential than any amount of regular or even surprise inspection.

Fig. 1.

LIFE FIRST, PROPERTY SECOND.

I should, perhaps, say at once that I consider it the duty of the authorities to attend to the protection of life in the first place, and to the protection of property in the second. As we all know how easily a panic occurs without any fire, and how dangerous the rush of a frightened audience can be, the clear exit of ample dimensions and most direct route will be the greatest safeguard against loss of life, and perfect symmetry of plan of very great value. The prevention of a cause for panic is best guarded against by the constant presence of experienced and responsible firemen, who will on the one side recognise the possibilities of danger in time to prevent a fire, and on the other be able to act smartly in case of an outbreak. I do not wish to disparage good construction, or regular and surprise inspections; but I consider the most careful regulations as to construction and materials are of little practical value, so far as the safety of the audience is concerned, if at the same time the planning is not straightforward, and responsible firemen are not regularly in attendance. To take an extreme case, wood stairs will take the audience quite as quickly into the open as stone ones, and stone stairs with many winders and a complicated plan will be far more dangerous than wooden ones of straight flights of, say, fourteen steps each. Don't let me be misunderstood; of course, good construction and fire-resisting materials lessen the risk of an outbreak of fire, and I shall always advocate such construction and materials. But I have inspected many theatres, built of slow-combustion materials, and yet have found them dangerous in the extreme through bad planning;

entertainment. What is the state of affairs as to semi-public and private entertainments in buildings, halls, or rooms only temporarily utilised for gatherings of this description? Why, so far nothing whatever scarcely has been essayed, let alone decided. Legislation on the subject in this country is as non-existent as it is on the Continent. Why, we have not even as yet any practical definition as to what a private or a semi-private entertainment is. Where do the privileges of private entertainment cease? and when does an entertainment assume a public character, not only as such, but more especially in respect to public safety? Think of the many meetings, so-called private theatricals, subscription balls, and other fêtes! How is classification to be attempted? How are we to define our entertainments? But here is a suggestion, is it necessary to classify at all? Is it essential to make limitations as to the different classes of our entertainments? I think not. Whilst most of our legislators at home and abroad are trying to define our entertainments and then to frame certain requirements for the safety of the public, why not let the character of the entertainment take care of itself? Let us look on every room over a given size as a place in which we may or may not congregate, with or without payment, to dance, to sing, to let others sing and dance, just as the case may be. Let the superficial area of any good room and its position alone govern our requirements for safety; not the fact that it is a private dwelling-house, a saloon at an inn, a school-room, or a board room.

COMPULSORY PLANNING.

If the Building Act of to-day defines the thickness of a party-wall and its height above

large drawing-room on the first floor have sufficient exit and staircase accommodation to deal with the maximum number of people who may press into that drawing-room, and let the same hold good for every class of structure, if a public-house, a schoolroom, or a chapel?

DANGEROUS VARIATIONS.

But now another point. How are we to assure ourselves that even if any one room or hall fulfils the ordinary requirements of safety as far as plan and construction are concerned, that the variations in the interior arrangement, in the decoration, &c., do not more than annul what the architect has done? Of course, a building, a room, or a temporary structure should be used for the object for which it is designed, and for no other purpose. But in reality we must consider the possible purposes to which a room may be put; in fact, the dangers of any decoration or paraphernalia necessary for the fulfilment of various objects must be considered at the time of construction. A hall which is used as a ball-room, and which is perfectly safe as such, may be a veritable death-trap when used for theatrical entertainments. A hall designed only for banquets, public dinners, &c., may become dangerous when utilised for bazaars, with all its temporary stalls and side-shows. The building must be designed to fulfil conditions of the greatest possible danger. Of course, many hold that we cannot limit ourselves to controlling the erection of buildings; but we must seek to obtain control over their employment, and the manner in which they are equipped for their different purposes. No doubt it is just the ordinary drawing-room, the ordinary assembly-room, the school-room, &c., which is used for so many purposes for which it is never intended, and that there are many dangers incurred on that account. Such control has been attempted in some Continental countries. But I think such control would be very hateful in these freer isles. We would, I am sure, rather build our houses and halls at once in such a manner as to be prepared for all risks rather than be constantly worried by inspections and the like. Hence, I say, rather let us at once build suitably for all emergencies. If we do that, we need not be constantly worried. Perhaps even improvement of plan and construction at the outset in a new building appears a very serious matter to you; but think, what does it really mean in nine cases out of ten? A few extra doors, and these so hung as to swing outwards; staircases perhaps somewhat broader, and not of a dangerous hanging type; hand-rails perhaps on both sides; a few safety bolts or latches. Surely this would not even interfere with a great art-architect's design, his colour scheme or details, and would this not save us endless worries of control over all private and semi-public entertainments?

UNSUITABLE PROVISIONAL BUILDINGS.

And now comes the question of provisional buildings erected for some specific purpose, such as a bazaar, and often allowed to remain in position for some indefinite period. Again, we find nothing has so far been done or decided so as to minimise danger in these structures—in

Fig. 2.

and I wish to point out that a building erected entirely of fire-resisting materials is not necessarily the safest.

PREVENTATIVE MEANS AT SEMI-PUBLIC AND PRIVATE FUNCTIONS.

But now all that I have said so far refers to the permanent building erected for a specific public

the roof, quite independent of the fact of a man giving a party, or lending his house for a drawing-room meeting, having a chemical laboratory in the place, dancing classes, or a school, why should there not be such planning compulsory as to prevent any room over a given size, be it a ball-room or a studio, being used without risk to life? Why should not every

fact, the meaning of a temporary structure has scarcely been defined. Is the large tent, built in the garden of a private residence, or on some verandah, a temporary structure or not in the meaning of the Act? And, if so, why are such tents erected with impunity for all manner of social functions throughout the London "season"? Well, gentlemen, to my mind the less temporary

FIG. 4.

WORKING DRAWINGS
EDWIN O. SACHS ARCHT. DEL.

FIG. 3.

structures are encouraged the better, and this, no matter what their character or purpose. But, when erected, let the same importance as to planning and watching be accorded to the provisional building as is essential for a permanent structure. Gentlemen, let us also remember the Charity Bazaar fire, and let us consistently avoid the flimsy and dangerous materials used for its construction. Why, we can even have temporary iron buildings at a very reasonable expense. But, above all, gentlemen, planning and watching should be kept strictly in mind.

DANGEROUS DECORATIONS.

If I may be allowed to call attention to any one thing, it is, however, to the fact that whatever the architect may do in any class of building used for entertainment, his efforts can so easily be annulled by flimsy decorations, appointments, equipment, &c.; it is just this so-called decoration combined with carelessness on the part of the individual that is the actual cause of most fires. Apart from facilitating the escape of the individual, the architect's efforts are to a great extent limited, as far as the actual fire is con-

cerned: first to avoiding the possibility of an outbreak occurring in connection with the structure proper, and secondly, seeing that should an outbreak occur his structure does not facilitate its spread. The architect cannot prevent a drawing-room, or a schoolroom being decorated with bunting, Liberty silk, or paper rosettes, and, as I have said, control in these matters would probably not be advisable in England. He cannot prevent the smoker "lighting up" at his smoking concert, or prevent the use of open lights, and official interference in such matters

would be unacceptable to the average Englishman. We can no doubt prevent many dangers in the usage of buildings erected for public entertainments. We could, and should, prohibit the wood stage of the theatre; we can prevent muslin hangings being used in the auditorium, and allow smoking only in specified rooms. But such restrictions would be intolerable and extreme if applied to rooms used for private and semi-public gatherings. It would not be practicable. Thus, again remember, we have to deal with certain well-known possibilities of fire with certain given facts, and for these facts you have to provide. The actual disuse of those Liberty silks, open lights, muslin, paper roses, in our private and semi-public entertainments, rests entirely with the good sense of the general public. Until the general public boycott them, you will, gentlemen, have to take them into account when you are at your drawing-board, or superintending your jobs.

CONCLUSION.

The first and principal remedy, to my mind, as I have already indicated, lies in your hands, as representatives of the architectural profession. It will be the architect mainly to whom we shall have to look for safety—we have to rely on the spirit with which he designs his structure, no matter what the regulations may be. Secondly, we must depend largely for improved protection on the general public, who will to a great extent, sooner or later, have to take upon themselves the rôle of being their own guardians. At present there is not the slightest interest in this country in the question of protection from fire, whether it be in connection with our entertainments or with the fire losses generally. That interest will have to be awakened. Thirdly, architects and public opinion will have to be supported, their hands strengthened or governed, as the case may be, by further legislation. But how are these remedies to be brought about? How are we to get the architect in practice to take a little interest in fire protection, not only in its general aspect, but specially in connection with our entertainments? How is the student to be encouraged to take the matter up? How, again, is the general public not only to be interested, but educated? How are our authorities to be assisted in arriving at practical conclusions and regulations, and our officials kept in touch with what is going on in these matters? It is a big question, gentlemen, for I go so far as to say that in regard to the general public, we should even let the Board School "standard reader" have pretty fables dealing with the dangers of fire, rather than some of the useless stories that appear to-day. I go farther still, and say that the public press, that great educational factor of to-day, might be induced to give us something more instructive about fires than mere reports of conflagrations, the efforts of our gallant firemen, and the exact number of feet of hose that are taken to a large fire. We might hear more of the origin of fires and the possibilities of prevention.

A COMMITTEE OF PUBLIC SAFETY WANTED.

How are we to attain these improvements? Well, gentlemen, to my mind, the right note has been struck at Paris. It has said: "Call together your leading architects and surveyors, your civil and mechanical engineers, your experts in chemical and other sciences. Call together your leading officials, the leading Government and municipal workers, and others seriously and scientifically interested in the technical and economical problems of to-day. Don't forget the leading fire brigade officers nor the owners of warehouses, theatres, and other dangerous property. Combine the many conflicting interests. Don't be afraid of compromise. Avoid one-sidedness. Examine what has so far been done at home and elsewhere. Find out what proposals are stowed away in men's minds. Confer. Then act, and act soon. But mind, no one-sidedness or petty prejudices." That is the advice from Paris, where it is being acted upon. Other countries will act on it too, and I hope Great Britain will be foremost among them. A small start has, in fact, already been made. At the initiative from Paris a small committee has been formed, which is taking up this matter of fire prevention. This is scarcely the place to mention names; but perhaps I may say there are among the members men whom you know and admire. That committee, made up of representatives of the different interests, will soon find a way to help the architect, to see that the general public does not forget the lessons of

the Paris fire, and that our legislators have sound independent assistance when required. Well, gentlemen, I hope some of the prominent members of the Association will be among the first to join and help this committee, and thus show that the opposition I first spoke of is not favoured by its leaders of our profession. It is fire prevention, mind you—preventing fires—that we have most to-day to think of—not putting the fire out when it is there. Let our gallant firemen look after the fire-fighting when the fire fiend is actually among us; but let us see that our firemen have as little work to do as possible, and that they are not handicapped to the extent they are at present.

THE ARCHITECTURAL ASSOCIATION.

THE first ordinary fortnightly meeting for the present session of the Architectural Association took place at 9, Conduit-street, W., on Friday evening, the president, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair.

Fourteen nominations for membership having been read, the following 46 architects were elected as members:—C. E. Abercrombie, S. J. Tatchell, H. W. Fitchett, H. M. Nisbett, J. H. Cammach, G. Trotman, C. H. B. Pinchard, W. H. Collin, P. B. Dannatt, A. S. Dorrell, L. de Senna Fernandez, E. M. Thomas, H. C. Fread, S. H. Goodwin, O. O. Harrison, H. J. Ingram, C. M. Inman, B. J. McAdam, C. E. Okely, A. W. Papworth, F. E. Ravenscroft, A. H. Rowe, H. Y. Smallwood, W. F. Wilkie, E. L. Wratten, M. D. Barton, A. R. Conder, R. G. Ell, A. Foxley, C. J. F. Hookway, Max Judge, A. R. Keighley, A. V. Kislbury, W. M. Settle, W. A. Jeckells, P. J. Westwood, L. I. Wood, E. M. Joseph, R. Hosking, H. Mackintosh, C. H. Reilly, G. Church, H. E. Rider, D. T. Fyfe, J. A. Swan, and H. S. de B. Lopez.

The President announced that during the afternoon of November 2nd (next Tuesday) the first workshop demonstration in Stoneworking would take place at Regent-street Polytechnic. These demonstrations were being arranged by the Technical Education Board, and would be free to all members of the School of Design. The elementary and advanced classes in that School of Design were about to be started, the former section having opened the previous evening, Oct. 22nd, and the latter would open on November 9th, and he earnestly appealed to students to endeavour to make them highly successful and useful. The subject of the elementary class was a draper's shop at the corner of two streets.

The President also notified that the opening concert of the A.A. Lyric Club would take place at the Swanton-street Assembly Rooms, Piccadilly, on Friday, October 29th (to-night) at 8 p.m. This entertainment would be open to every member of the Association, and he cordially invited all to attend.

LESSONS FROM THE PARIS CHARITY BAZAAR FIRE.

Mr. ERNEST O. SACHS read a paper on this subject, which, with the plans and designs exhibited on the walls, is reproduced on p. 606 ante.

Mr. RICHARD ROBERTS, vice-chairman of the L.C.C., who was invited by the President to open the discussion, remarked that the County Council and the public generally were greatly indebted to Mr. Sachs for the continued interest he had taken in the subject of the safety of audiences in large buildings, and especially in temporary structures. It was admittedly impossible to eliminate every risk; but much might be done to increase the safety of assemblies of people. He thought, however, Mr. Sachs went a little too far in proposing that the children should be taught in board schools the risks of panics and of fires. He claimed that the London County Council had done a great work in regard to this matter, under the able advice of their permanent officials—indeed, the Metropolis was greatly indebted to Mr. Blashill, the Council's architect, for his labours for the safety of the public. In this disastrous bazaar fire at Paris, the velarium proved a source of great danger, and the County Council had recently been asked to sanction the plans for a very large show, in which a velarium was proposed to be employed. The county council objected to this feature, on account of the risk, and the promoters decided to abandon it. The council were obliged to insist, in the public interests, in this and in all cases,

on the prohibition of all flimsy decorations, and on the provision of a sufficiency of exits. He had heard it suggested that certain entertainments of the A.A. had not been altogether free from danger, and if gentlemen possessed of all technical and practical knowledge admittedly ran risks, they could not expect the public to be more careful. In all these matters, a local authority could not go in advance of public opinion—they had to take public opinion with them. The L.C.C. officials made their requirements on a wide basis, and if in the actual buildings they were occasionally minimised, it was due to the lay mind on the committee, who strove to make the conditions less onerous, and he, therefore, felt that they owed a great debt of gratitude to Mr. Blashill and his officials for reducing the danger of fire and panic in London places of entertainment. They had an eminent theatre architect, now no more, who always took care that his buildings were safe, but was essentially of a militant turn of mind, and delighted in fighting committees and officials on their requirements. The question of the safeguarding of temporary structures was a very serious one in London. They were not, of course, used for so long a period as permanent buildings, but they were necessarily built of less substantial and less fireproof materials, and while in use, the risk to the public was the same as in a permanent structure. There was a general notion that payment was necessary to constitute a building a place of public entertainment; this was a mistake, for the fact that the public could enter a building made a "place of entertainment," and as such, subject to regulations for safety. The building committee of the L.C.C. never granted licenses for temporary buildings for commercial or trade purposes, only relaxing this rule for religious and philanthropic gatherings, and he applied to all architects present to set their faces against all temporary structures. Mr. Sachs had put his finger on the point of danger in these temporary buildings, and he agreed with the lecturer as to the necessity for good planning and constant watching in such structures. As to the suburban theatres which were now rising on every hand, he was pleased to bear testimony that they were as perfect in planning and in site as they could well be; but he would not go so far as to say that they were equally perfect from an architectural or decorative standpoint; but as a public body the committee for whom he was speaking that evening had only to deal with the public safety.

Mr. SIDNEY GAMBRILL, of the Metropolitan Fire Brigade, held that it was the duty of the architect to make every public building as slow-burning as possible. At the recent disastrous fire at Oporto, all the people, with two exceptions, safely got out of the hall itself, but they were caught in corridors, with the result that over 100 lives were lost. His experience during the 20 years he had been a public official was that architects pressed public authorities very hard to relax their regulations in favour of their clients; but they had never got anything out of the speaker, although, unfortunately, committees were often amenable to persuasion. The death roll in London from actual structural fires was not great: the bulk of fatalities resulted from clothing catching fire or from the bursting or throwing of mineral lamps. It should be remembered that panic rather than fire was the chief cause of loss of life, and one hysterical woman might at any moment be the source of great danger to a crowded assembly. Notwithstanding what Mr. Sachs had said, he doubted very much whether glass in a roof would speedily fall even in the fiercest fire. If no water played on it the glass would stand a long time, and even if it fell it would be in most cases beneficial, as it would afford an exit for the smoke. It was a painful fact that a person was soon burnt to death in a fierce fire, it being only a question of seconds before life was extinguished. He feared that no amount of inspection would prevent a badly-planned building from becoming a death-trap if a panic or fire occurred, but something might be done. In Oporto, since the disastrous fire, a certificate had to be given, each evening a place of entertainment was open, that the gangways and approaches had been personally inspected and were free from obstruction, and he thought it would be well if a similar regulation were enforced in England. One great source of risk was allowing theatre firemen to be utilised for odd jobs, and as cab-runners; this too common practice in London should be absolutely prohibited. One of the greatest difficulties was that

buildings were so often altered after the architect had left them, and often the professional adviser got the blame for disasters of which he was quite innocent; in like manner the authorities, and even the owners of property, were entirely ignorant of the dangerous structural alterations made by the occupier. Again, every country, and even every large town, had different regulations, and he found that even in England they could not hope that any general code of regulations would be passed by the Legislature and uniformly enforced.

Major Fox, chief officer of the Metropolitan Salvage Corps, endorsed many of Mr. Sachs's views. He had inspected the ruins of the burnt bazaar at Paris within 24 hours of the outbreak, when not enough *débris* remained to fill a Pickford's van. He concurred with previous speakers that panic was the chief cause of fatalities. Churches were far less risky places of entertainment, but it would only be right that the places of worship should be periodically examined to see that a sufficiency of exits were provided. Great credit was due to the officials and building committee of the L.C.C. for the efforts made to minimise the danger of fire. He agreed with Mr. Gambrell that glass in skylights was not easily broken by fire, and that it would have been better had those in the Paris bazaar fallen at first. The great cause of fatality was the velarium which fell in burning fragments on to the people and set alight many dresses.

Mr. THOMAS BLASHILL, superintending architect L.C.C., observed that in dealing with plans of public entertainment he felt it a duty to see personally to everything that could be a possible source of danger, and to be stringent in insisting on compliance with each regulation. His report went before a committee of laymen, and he was bound to say that most laymen, as a body, did not take the slightest interest in protection from fire. The proprietors of theatres were not by any means the worst offenders against regulations; their money was locked up in these ventures, and they had had long experience of the pecuniary results of panic. The persons whom he feared were those who wished to erect temporary buildings—clergymen and schoolmasters—who were absolutely reckless and unimpressible as to fire risks, and therefore he was more and more stringent in requirements as time went on. As to theatres, it was rare indeed that a thoroughly bad plan was sent in for approval, or that he had to argue with the architects to amend them. As to the lessons the practical man could draw from the Paris fire, he held that that fire conveyed no lessons whatever; everyone knew what a building so planned, in which improper and inflammable materials were so recklessly used, and which was so filled with combustible goods would be like if a fire broke out. He had seen some reckless combinations of materials, but never one so bad as this charity bazaar. Some time since his staff and he were engaged with a very large building for an entertainment, and at last passed it as fit to be opened. Just before the opening he made a visit of inspection, as it contained many thousands of seats. He found that, after it was completed, thousands of strings had been let down from the roof, and from each depended a mass of loose folded papers as large as a tablecloth. Then there were coloured wreaths with paper flowers, and, of course, a velarium, and with a single taper he could have burned the place to the ground. At another time he found that all the exit doors were locked on an opening day, and on sending for the manager, he assured him that he had the keys in his pocket, and that as soon as the performance was over they should be unlocked. Of course, the speaker insisted on compliance with the requirements. Sometimes men not too highly paid would stack all manner of inflammable goods in the cleared spaces near exit doors. Those who required occasional licenses did not often employ an architect, and it was difficult to persuade the promoters that there was a risk of fire or panic. He did not see why audiences at entertainments should be specially protected; every church and large gathering should be equally safeguarded. He would give just one word to young architects: Let them suppose they came before the London County Council and over-persuaded the speaker or a lay committee that certain regulations might in their particular case be relaxed. If afterwards a panic should arise, or an accident should occur, let them reflect on the position that would be occupied by the architect to the promoters. The whole responsibility would undoubtedly be thrown, not on the proprietor, but upon his professional adviser.

Mr. WILLIAM ARCHER remarked that, as a theatrical critic out every weeknight, he was conscious of running terrible risks in the discharge of his duties, and was interested in anything that tended to minimise the danger. The construction and planning of many West-end theatres did not inspire the habitual playgoer with much confidence, especially as to the sufficiency of exits and their surroundings. He thought it would be well if the public were more nervous as to theatres, and so brought more moral pressure to bear on proprietors. He must say that in certain theatres the regulations for safety were exceedingly bad. A great deal might be done by such a committee as Mr. Sachs was organising in directing public attention to this question. He observed everywhere directions concerning extra doors in case of emergency, but never saw any signs that such exits could be opened when necessity arose. Perhaps, on the whole, it was well that the public were unimpressible and apathetic; but that was no reason why every possible means should not be taken to protect an audience from risk.

Captain DYSON, superintendent of the Windsor Fire Brigade, said he had been over most of the Continental theatres with Mr. Sachs, examining their fire appliances. From the professional fireman's point of view, it seemed that every possible want of precaution existed in the Charity Bazaar at Paris; but if they had had a chemical fire-engine in the cinematograph room, the outbreak might have been quenched at once. If country corporations were to enforce regulations as to fire, they would first have to put their own town halls in order. In Windsor, the brigade always hoped that if fire did break out, it would occur in an old house with huge wooden beams, and not in a modern so-called fireproof building.

Mr. HENRY LOVEGROVE proposed a vote of thanks to Mr. Sachs for his excellent and instructive paper on a subject to which the lecturer had devoted much time, and had travelled all over the Continent collecting facts. He wished they could have retrospective legislation as to the old temporary buildings which existed all over London. There were numerous old wooden buildings which were a grave source of danger, and with which the district surveyors had no power to deal. Protection ought to be extended to all schools and churches.

Mr. MAX CLARKE seconded the vote of thanks, remarking that he entirely disagreed with the lecturer as to the responsibility of architects. Hitherto the architect who had given the theatre speculator the largest value for his outlay had been the most successful. He held that it was of the utmost importance that the theatre architect should use fire-resisting materials. It was true that firemen held that when once alight an iron and concrete building was more dangerous than one of timber; but unless crowded with inflammable goods the iron and concrete building would not catch fire. He asked, was the velarium to be universally condemned, and would they remove the one at the Albert Hall? Was it not possible to render velaria unimflammable by chemical solutions? Too often the proscenium was of fibrous plaster backed up with wood. The greatest requirement in a theatre, in his opinion, was a fireproof and smokeproof partition between the stage and auditorium. He had the misfortune to make for the late Mr. Phipps the drawings for the theatre at Exeter, afterwards destroyed by fire, and suggested to Mr. Phipps that a window might be provided on the stairs, opening on to a concrete flat, for use in case of emergency. The suggestion was adopted, but when the outbreak occurred the window was not utilised. The late Mr. Phipps was not a militant architect; he hated a controversy, but he was strictly conservative, and had a dislike for iron, stone, and concrete as materials for a theatre.

The PRESIDENT, in closing the discussion, remarked that efficient watching was the best precaution to be taken for the protection of theatre audiences. Mr. Sachs had done good service in calling the attention of architects to the urgent necessity that existed for good planning, especially in staircases and exits, to the importance of guarding against panic as well as fire, and to the desirability of using fire-resisting materials. He held that plan should come before materials in the architect's mind.

Mr. SACHS, in replying to the vote of thanks, which was carried by acclamation, explained that the skylights in the roof of the Paris bazaar were filled with glass of the poorest quality—thin, brittle, and indeed rotten, and it was a matter

of evidence that glass fragments, as well as burnt portions of the velarium, fell upon and injured the victims. He was not an opponent of fire-resisting materials, but held that a stone staircase was of little value if its route was tortuous, and in such a case a short two-legged staircase of wood was preferable. There was great difficulty in getting independent testimony as to the non-inflammability of preservative solutions and of so-called fire-resisting materials.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

AT a special general meeting of the donors and subscribers, held at the offices of the Institution, 21, New Bridge-street, Blackfriars, E.C., on Tuesday, October 26, a resolution was passed, increasing the annual pensions to males from £25 to £30, and the annual pensions to widows from £20 to £24, and at the same time extending the limit of income (apart from the pensions) from £25 to £35 to per annum, in both cases. Mr. Thomas Hall, the president, occupied the chair, and at the close of the proceedings was warmly thanked for his services. The Institution is enjoying a very prosperous year under Mr. Hall's able presidency.

NEW BRIDGE ACROSS THE SEINE.

THE Alexander III. Bridge being now constructed over the Seine in Paris, in connection with the Exposition of 1900, will be a remarkable structure of considerable boldness of design. The preliminary stage of the work is now progressing in the large abutments to provide the reactions for the thrust of the flat cast-steel arched members. The foundations are being prepared by the pneumatic caisson process. There is no channel or centre pier; but the span of the arch will give a clear waterway of 358ft., with a breadth between parapets of 141ft., a roadway of 65ft., and two side-walks of 33ft. wide each. According to *Engineering*, the main platform is carried on 15 solid webbed arch ribs of 352ft. 8in. span, of 20ft. 7½in. rise, and 37-4in. depth at the crown, spaced about 9ft. 4½in. apart. The roadway is carried on solid steel plates nearly level with the extrados of arch ribs. Over the haunches it rests on columns about 12ft. apart, diagonally braced in longitudinal and transverse planes. The writer says: "The astonishing feature of the whole construction is that these long-span arch-ribs are made in large sections of cast metal—cast steel, it is true, but still primitive cast girders, not unlike the earliest examples of iron bridges, although the remainder of the framework is made of riveted rolled steel. The arch sections, about 15ft. long, have in the intermediate ribs solid heavy webs, with thick flanges extending continuously around both sides and both ends. This flange is 2ft. wide, and is reinforced by two intermediate vertical web stiffening ribs, and by top and bottom bracket braces on both sides in the centre of each panel." Each rib is of I section, and the sections are connected by approximately horizontal bolts parallel to the plane of the web through the abutting end flanges. Each arch-rib is hinged at the crown and skewbacks. The outside ribs are of unbalanced sections, with web wholly on one side of the flanges in section, thus E. The web is open in some of the panels, and will have an ornamental treatment. The bridge is under the supervision of M. Résal, chief engineer, and M. Alby, resident engineer. The extreme flatness of the arch gives a rather weak look to the structure, which may be regarded as rather a girder of slight curvature.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—VII.

By AN ASSOC. INST. ELECT. ENGS.

STORAGE BATTERIES OR ACCUMULATORS.

A VALUABLE adjunct to the dynamo in a generating station, and often forming, in a secondary sense, an element of the source of electrical supply is the storage battery, or accumulator, which, although closely allied (in so far as forming part of the source in a private plant) to the subject of generation, must not, in any sense of the term, be considered a generator. A storage battery is purely and simply a convenient means of storing energy. As we shall

have frequent occasion to refer to the application of accumulators, we shall here give a simple outline of the theory, construction, and use of these valuable additions to generating station equipment. To understand the theory and construction of accumulators, it will be best to consider the earliest devised form of voltaic accumulator, of which Grove's gas battery is a good example. As every student of electricity knows, electrolytic decomposition takes place whenever electricity passes through a bath containing an electrolyte, which may be defined as a compound chemical body capable of undergoing a chemical dissolution by an electrical current. Thus, if we interpose in a circuit a vessel, called a voltameter, such as is shown in Fig. 14, in which two platinum plates called electrodes are fixed in two separate glass tubes, A and B, by means of platinum wire hermetically sealed in the tubes closed at the top, so that the electrodes are suspended in water acidulated with sulphuric acid and filling the tubes A and B, it is found that the water is decomposed into its two component elements, hydrogen and oxygen, whenever electricity passes through the electrolyte, and that the oxygen accumulates on the positive pole of the voltameter, whilst the hydrogen is carried forward with the current. As indicated in the figure, connection is made with the source of electricity by means of terminals at the ends of the platinum wires. As the electrolysis continues, the gases, in collecting as stated, displace the acidulated water until the platinum plates are completely surrounded with the two gases, and in passing it may be mentioned that the volume of the hydrogen at the negative electrode is twice that of the oxygen at the positive electrode. If, whilst the electrodes dip into the electrolyte so as to form a complete circuit, the voltameter be detached from the source and connected to a galvanometer or other current indicator, it will be found that the converse process results, and that the charged voltameter now acts as a battery—in other words, a current in the opposite direction to the current producing the electrolysis traverses the circuit, and at the same time the two gases in the tubes A and B combine through the medium of the acidulated water, and thus gradually disappear, refilling the tubes with the electrolyte. This process only takes place so long as the gases are in contact with the electrodes, and it is immaterial whether the gases have been produced by electrolysis or by the ordinary chemical methods, and any arrangement which permits the accumulation of the products of electrolysis by means of a current from an external source, so that an inverse current may result, is called a *secondary cell*, or *accumulator*, and a combination of such cells form a battery.

The following is a simple explanation of the above actions:—"It is fully recognised now that there is a large class of liquids whose dissociated radicles are charged with electricity, half of them with positive electricity, and hence called electro-positive, and the other half with negative, and hence called electro-negative. Moreover, Faraday proved that each monad radicle, of what kind soever, is charged with exactly the same quantity, although the sign may differ. The existence of these charges is certain from the facts of electro-chemistry, and the electrical charge appears to be the essential condition for even the momentary existence of a free radicle. It further appears that when two opposite radicles combine, their charges are either lost or masked by proximity; and that before two radicles of the same kind can unite into a molecule, their charges must be given up to the same third body. All electrolytes are capable of being decomposed, by electrical means, into such dissociated and oppositely-charged radicles. In the case under consideration, the hydrogen and oxygen are dissociated radicles, the former being electro-positive, and oxygen electro-negative. During the process of electrolysis, the two electrodes are charged electrically from an external source, and the electrified radicals are mutually affected by the electrified electrodes with the result that the oxygen atoms adjacent to the positive electrode are attracted by it; they deliver up their charges to it, and uniting into molecules, rise as gas. Their places are taken by others from the slightly more remote region, and so on, a virtual procession of oxygen atoms continually taking place towards the positive plate, each carrying its charge with it. The same thing happens on the hydrogen side, only that twice as many hydrogen atoms take part in the action, the charge of each being half that of an oxygen atom."

Whilst the gas battery is an extremely interesting form of voltaic accumulator, it is altogether unsuitable as a secondary generator for commercial purposes. It is defective in so far as only a limited proportion of the gases, hydrogen and oxygen, liberated during the charging is available and effective in recombining to set up an electrical current, the remaining proportion either being lost or not in the immediate vicinity of the plates. To utilise the principle underlying the action of a gas battery for a storage of chemical

FIG. 14.

energy—for it must be remembered that a voltaic accumulator does not store electricity, but chemical energy, which may be used as and when desired—it is obviously necessary to prevent the escape of the liberated gases, and this may be done by producing by means of a secondary chemical action, a substance, or substances, so disposed that the converse process may readily take place with little loss. A solid, not soluble in water, satisfies these conditions, and at an early date lead plates displaced the platinum plates, for by sending an electric current between lead plates immersed in dilute sulphuric acid, an oxide of lead is formed on the surface of the plates immersed, which in a marked degree is particularly adapted for storing the energy given up by the current and giving it out as required. Sir W. Grove, in his experiments with gas batteries, proved that the efficiency of these batteries was materially increased by coating the platinum plates with a kind of spongy platinum, known as platinum black. By this means the products of electrolysis are accumulated in close proximity to the plates. The resistance of a cell is also diminished by fixing the plates near together, and by using large plates the requisite amount of exposed surface to give sufficient capacity for commercial purposes is secured, and the internal resistance is reduced to a minimum.

To Gaston Planté we owe the discovery that lead plates lend themselves readily for storage purposes. As the result of his researches he found that by taking two large sheets of lead and separating them with strips of non-conducting material and rolling the whole together, so as to form a double spiral, the cumulative effect was produced when the two plates were immersed in dilute sulphuric acid and a continuous current sent from one to the other. What really takes place is that the water is decomposed, and the oxygen as produced combines with the positive plate to form peroxide of lead (PbO_2), whilst the liberated hydrogen forms a film of gas on the negative plate. On discharging the cell through an external resistance, the peroxide of lead is reduced to spongy lead and the other plate is oxidised. This action is continued by sending a current through the cell in the opposite direction to that of the first charging current, and by continuing this process of charging, discharging, and reverse charging for a considerable time, a properly-formed Planté cell is produced. At this stage one plate has a good coating of peroxide of lead, and the surface of the other is in the spongy condition. The converse processes of charging and discharging (except so far as the energy is utilised) is now discontinued. The potential difference between the plates when charged is from 2 to 2.5 volts.

It is obvious that the objection to this method of making accumulator plates is the length of time, the attention and expense required to form

the plates. Planté himself found that forming could be assisted by chemical means, for by simply treating the plates with dilute nitric acid, the formation of the plates is accelerated. The most important improvement, however, was that of Faure, who coated the plates with a paste of lead oxide and acid, by which means the amount of energy required to form the plates was diminished and a larger amount of active surface was produced. The paste employed was a mixture of sulphuric acid and red lead (minium = Pb_3O_4), forming a paste of lead sulphate ($PbSO_4$). Both plates received a good coating of this paste, and when a current was sent between the plates, one—the positive electrode—absorbed the oxygen, resulting in the conversion of the paste into peroxide of lead, whilst the plate connected to the negative terminal of the source was readily reduced to a spongy condition, and thus a satisfactory active surface was produced with less trouble than with Planté's method. The difficulty, however, with pasted plates is that the paste does not adhere persistently to the plates, and many improvements have been introduced to form permanent plates, and to prevent the paste from being detached from the plates, and the usual method is to perforate ordinary lead plates, or to cast them in form of grids, the spaces being filled with paste.

There are thus, generally speaking, two types of accumulators—the Planté or plate form, and the Faure or pasted form. The original Planté plate has given place to improved forms, the best of which is probably Epstein's. In this case, each plate consists of a single corrugated lead casting, so as to present a much-increased surface to the solution without increasing the external dimensions. The castings, previous to being formed electrically, are boiled in a weak nitric-acid solution, and, as was remarked in connection with Planté's experiments, the surface is then in a suitable condition for subsequent electrical treatment. It will be obvious, therefore, that this form of plate possesses decided advantages. The solid character of the plates, for instance, gives durability—a very essential property. Furthermore, there is no possibility of the active material being disintegrated, whilst the solid nature of the plates is conducive to low and uniform resistance.

The chemical actions explained above may be expressed as follows:—

(1) *Planté's Plate*.—Before forming has been produced—

(Positive) Pb $2H_2O + 2H_2SO_4$ Pb (Negative)
Lead. Water and sul- Lead.
phuric acid.

When formed—

(Positive) PbO_2 $2H_2O + 2H_2SO_4 + 2H_2Pb$ (Negative)
Peroxide Sulphuric Lead
of lead. acid.

(2) *Faure's Plates*.—When forming has taken place.

(Positive) $PbSO_4$ $2H_2O + 2H_2SO_4$ $PbSO_4$ (Negative)
Lead Water and sul- Lead
sulphate. phuric acid. sulphate.

When formed—

(Positive) PbO_2 $2H_2O + 2H_2SO_4$ Pb (Negative)
Peroxide Water and sul- Lead
of lead. phuric acid.

(To be continued.)

NOTES ON SURVEYING AND LEVELLING.—IV.

By WALTER TESTER.

FIG. 2 shows the state of affairs when the surveyor has to commence setting out for the brickwork. The excavator has still got his railroads in and his waggons at work, and there are heaps of loose rock and sand lying about, in addition to many other obstacles, such as heaps of bricks tipped ready for use, and, in spite of these difficulties, he must now set out with considerable accuracy. Suppose he has to commence with levelling the wall A B, Fig. 2. Then—

$$\text{The angle } A R B = \frac{360^\circ}{8} = 45^\circ.$$

$$\text{The angles } A R U \text{ and } B R U = \frac{45^\circ}{2} = 22\frac{1}{2}^\circ.$$

He can place his theodolite over the centre point R, and set on the axis S T, placing the vernier at 0, and clamping the circles, and then setting the vernier round to read $22\frac{1}{2}^\circ$ or 360°

Fig. 2.

-22½°, as the case may be, he can set out the angles B R U, A R U. These angles being marked out carefully in this manner, the lines R A and R B should be retained, and a convenient way to do so is to drive two posts firmly into the ground clear of the excavations, and nail a board across them at the level of the centre pier, the point where the line cuts across the board being fixed exactly coincident with the vertical hair of the telescope; a saw-cut may be made at this point, and will be very useful, as a string-line can easily be fixed into it. The centre point of the octagon should be marked with a nail, as it is very convenient for fixing the end of a line or the ring of the tape on to, and will often save a man.

lutely fixed in position, and we will suppose that the bricklayer works round the octagon in each direction, then in succession the walls B C, A H, C D, H G, D E, &c., will require to be set out. They should all be dealt with in a similar manner to the wall A B, always, in setting out the angles, starting off the axis-line S T.

Angles U R B, U R A = 22½°
" U R C, U R H = 22½° + 45° = 67½°
" U R D, U R G = 67½° + 45° = 112½°, and so on

When the line R E is reached, the telescope of the theodolite should be turned over, to see if it is in line with R A, and also, if the angles are set out correctly, the length of the sides of the octagon should be exact. So far as the wings are concerned, they present no difficulty once the

reference to one or two points which require noting. Of course, the sections must be plotted down to scale, both the original ground and the rock levels being shown (Fig. 3), the rock line being indicated, say, in red. The position of the building and the working level must be shown

Fig. 4.

on; the area of sand and rock moved may be coloured or scored. It is a common practice to plot these sections to two different scales, the horizontal scale being generally less than the vertical, levels being of more consequence, especially, for instance, in drainage works; but where the sections are solely for the purpose of taking the quantity of excavation, it is more convenient to plot them to a natural scale, as the irregular areas of excavation can be taken out with a planimeter

Where the horizontal and vertical scales are

Fig. 5.

different—say 40ft. to the inch and 10ft. to the inch respectively—no oblique dimensions should be scaled off the sections, as they are neither one thing nor the other, but only measurements along either horizontal or vertical lines, using their respective scales.

Each section is supposed to apply to a strip of ground half-way to the next line on each side of

TOWER BUILDINGS SITE

Fig. 3.

point along the lines R A and R B, the tape must, of course, be kept horizontal, and the points carefully plumb down with a good heavy plumb-bob, as they are often considerably below the formation level—as, for instance, for the wall A B, the points being plumb down in the trench, and marked on the rock with a nail or a chisel-mark. Of course, the rock must be properly stepped and levelled-off to receive the brickwork. Once the wall A B is built, the building is abso-

sides of the octagon are set out, as they can be measured out in the ordinary way, care being taken to check the position of the line square off the sides of the octagon with the diagonal dimensions A K and J B. Also, any internal walls can easily be filled in. As it will probably fall to the lot of the surveyor to square up the measurement of excavation, having taken the sections for same, it will be as well to make a few remarks in

it, and the area taken from the section must be multiplied by this width for the cubical contents. This is on the assumption that any rise on the right-hand side of the section-line is counter-balanced by a fall on the left. This causes a slight variation to occur at the outside of a series of parallel sections. (See sketch, Fig. 4.) Section No. 2 is multiplied by the width, as already mentioned, of the strip shown in dotted lines. Now, there is only a piece left next section

No. 1 about half the width, to which each of the other sections applies, and section No. 1 is at the extreme end of it. The best way to deal with this is to add Nos. 1 and 2 together, divide by 2, then add the result to No. 1, and again divide by 2. For example, suppose section No. 1 is 520sq.ft. and section No. 2 is 1,200sq.ft., then—

520
1,200
2,1720
860sq.ft. section half-way between the
two lines Nos. 1 and 2.
860
520
2,1,880
690sq.ft.

This is equivalent to a section in the centre of the half strip at the end, and must be multiplied by the width of the half strip.

The only other portions that present any difficulty are the triangular pieces outside the octagon corners, and they can be taken in the following manner (see sketch, Fig. No. 5). Calling the sections Nos. 1, 2, and 3, and octagonal corner D, add together Nos. 1 and 2 and divide by 2 for an average section, which will apply to the triangle D 1 2. Find the centre of gravity of the area of excavations in each section, and put the position of these two points on the plan, then use their distance apart for multiplying the area of excavation for the cubical contents. Deal in a similar way with the other triangle D 2 3.

Any excavation beyond the main lines, as for areas, &c., must be measured on the ground, or they may be taken from the general building drawings, a height being obtained from the sections; but they cannot be taken from the sections in the method described above, which only applies to general bulks of excavations bounded by regular lines. Also trenching, for walls below basement formation level, and excavation for arena, and tower-pillar foundations must be arrived at independently, as they cannot be taken from the sections.

Nothing has been said about setting-out the base of the steel tower, as it is proposed to devote the next article to that subject.

THE EMPIRE PALACE OF VARIETIES, MIDDLESBROUGH.

THE site selected for the building covers an area of upwards of 11,000sq.ft., having frontages on three sides to Corporation-road, Pine and Dunning-streets, and a frontage to a right-of-way in the rear, thus being practically isolated. The main approach is from Corporation-road through a handsome hall, 34ft. by 19ft. and 18ft. in height, having a large recessed fireplace and wainscotted walls; at the left-hand side upon entering is the box-office, adjoining which is the staircase to the stalls, whilst on the right is a broad staircase leading to the grand circle; in addition there are two emergency exits from the stalls into Dunning and Pine-streets, and an emergency exit staircase from the grand circle into the former thoroughfare. The pit entrance is from, and on a level with, Dunning-street, with an emergency exit opposite directly into Pine-street, whilst the gallery entrance is from the latter street, with an emergency exit into Dunning-street. The auditorium is nearly square, being 60ft. in width, 63ft. deep, and the average height to false ceiling 45ft. The area comprises 120 orchestra stalls, 120 stalls, and a pit with seating accommodation for about 450. Spacious saloon accommodation is provided. The grand circle has seating accommodation for 150 persons, with ample lounges; immediately in the rear over the entrance hall is the principal saloon, 34ft. by 27ft., approached by two short flights of steps, thus enabling a clear view of the stage to be obtained. A further saloon is also provided on the Dunning-street frontage. Both the entrance and exit staircases terminate in roomy lobbies, and there are communication staircases directly into the stalls from either side. Four private boxes flank the proscenium, and on the gallery level are two private boxes. The gallery itself has seating accommodation for 750 persons, and a suitable saloon is provided in the rear. The ceiling, proscenium, circle, and box fronts will be in specially-designed and modelled plastic work, following, in a degree, the Spanish Renaissance treatment of the exterior. The ceiling will be painted with allegorical subjects. The principal

seats will be of the tip-up pattern and upholstered in velvet, and the pit seats upholstered in leather. The stage and its accessories are roomy, and will permit of spectacular productions of all kinds. Its dimensions are as follow:—Width from wall to wall, 70ft.; average depth, 35ft.; height to flies, 25ft.; height to grid, 55ft.; proscenium opening, 30ft. square. Six spacious dressing-rooms are provided, entirely distinct from the stage and in a separate block, each room being fitted up in the most approved manner; the stage entrance is from Dunning-street, and the scenery entrance in the rear of the building. Mr. Ernest Runtz is the architect, and our illustration is taken from the drawing shown at the Royal Academy this year.

THE BIRMINGHAM MEAT MARKET.

THE new meat market and slaughter-houses were formally opened by the Lord Mayor of Birmingham on Wednesday. The establishment, when completed, will occupy two acres and a half; the total cost will be about £110,000. The site, including compensation to leaseholders, has cost £40,120. The remaining expenditure has been estimated as follows:—Buildings, £48,000; general fittings, £10,533; lifts, boilers, tanks, butchers' offices, &c., £2,611; electric lighting installation, £10,144. To this must be added the expenditure—probably about £10,000—which the Linde Refrigerating Company, the lessees of a large portion of the basement, are undertaking. The style of architecture, a modification of that of the Spanish Renaissance, has been chosen, says the *Birmingham Post*, because low walls and overhanging eaves are desirable in order to keep off the direct rays of the sun. At the same time, it is displayed to real advantage by the material found most cheap and durable for buildings in Birmingham—namely, red brick and buff terracotta. The site has been laid out in three sections, each extending across between the almost parallel thoroughfares, Bradford-street and Cheapside. The middle section is occupied by the wholesale meat market. On each of the other two sections, divided from the market by a wide cart-road, are slaughter-houses, with lairs and other auxiliary accommodation. The rest of the site is taken up on the northern boundary, fronting Sherlock-street East, by an administrative block, and at the opposite end by triperies and the quarantine department, while at the Bradford-street end of this section is a tower. Under the market is a basement containing, on the Bradford-street side, the electric-light engines and dynamos and the pumping machinery, and running under the market a long range of cold store and chill-rooms, with a wide cartway between them. The low bastion-like tower, which, with its mouldings and animals' heads in terracotta, form a feature at the corner of Sherlock-street East and Bradford-street, contains the market superintendent's and inspectors' offices. In the adjoining range of buildings are the caretakers' rooms, the slaughtermen's mess-room, stable, and van-yard, and stores for hides, fat, &c. The Cheapside corner is not yet built, the leases of the old buildings having about thirty years to run. In Sherlock-street East is the main cattle entrance, and the lairs for cattle and sheep are on the upper floor. There are two inclined roadways, with men's way between, so arranged that animals coming down for slaughter will not meet those coming up to the lairs. For lamed or unmanageable beasts a hydraulic lift is provided. Water-troughs, supplied by pipes, run alongside the pens, and the fodder racks are underneath. There are twenty slaughterhouses in this department. Powerful arc lights are provided for the yard, while in the lighting of the slaughterhouses 119 lamps of 32c.p. and 97 of 50c.p. will be employed. From the concrete floors of the lairs the drainage flows into open iron troughs running along the outside wall. From these it descends by iron shoots into shallow open channels in the pavement of the yard. The slaughterhouse floors are arranged so that the swillines flow directly into open gutters, and so into the channels outside. At the boundary wall a catchpit is provided. This has three levels, with meshed screens successively increasing in fineness, so that practically all solid matter is removed before the drainage reaches the sewer, which it enters at the street boundary through a pipe fitted with a trap and manhole. Nowhere in the place is there any pipe connected with the public sewer. The solid refuse must perforce be removed promptly by hand. To facilitate the systematic cleansing of the floors

and channels and the removal of refuse a small trolley runs along rails in the yard adjoining the slaughter-houses. On the farther side of the market the slaughtering accommodation has been arranged on the Continental principle—two large halls, one for pigs and the other for cattle and sheep, taking the place of the separate slaughter-houses. The slaughter-halls have a width of 40ft. That for beasts and sheep is 240ft. long, and that for pigs 96ft. long. Adjoining the slaughterhouses, as in the other yard, are pens for animals awaiting slaughter. Covered lairs for pigs are provided on the ground floor, while over the large slaughter-hall are lairs for cattle and sheep. The total lairage is for about four hundred beasts, about a thousand sheep and calves, and over two hundred pigs. The tower, which rises 100ft. above the street, has gilt cupola and grille-work, mouldings and quoins of buff terracotta, and will contain three large tanks. The central and most imposing portion of the establishment, the wholesale meat market, has a length—from Bradford-street to Cheapside—of 365ft., and a width of 90ft. The roof is in one span, whose ridge will be 64ft. from the pavement, and has hipped ends. The floor is divided into 73 market spaces, and has two longitudinal and three cross avenues. Over the central group of stalls is a range of wood and glass cubicles, approached by spiral staircases. These will be the offices of the wholesale butchers. Each stall or stand is surrounded by iron rails with roller hooks for suspending carcasses. Hanging room is thus provided in the market alone for 3,000 sides of beef. Above these rails is another set, which forms a system running throughout the market, and out across the roadways on either side to the slaughter-houses. Two hydraulic lifts in the centre of the market, which communicate with the basement, will have similar rails rising to the level of this system, and connecting with it. The Linde Company's premises occupy about two-thirds of the available space in the basement. The storage accommodation consists of fifteen rooms, each insulated by 12in. of vegetable silica packed in the walls and the floor. The cold stores, kept at a temperature 18° below freezing point, will hold 25,000 sheep, and the chill-rooms, kept at 36° Fahr., three hundred sides of beef. At the Bradford-street end are the engine and dynamo-rooms. The electric-lighting installation, probably the largest private gas-engine installation in the city, has been carried out under the superintendence of Messrs. Henry Lea and Thornbery.

The new market and slaughterhouses have been built to the designs of Messrs. Essex, Nicol, and Goodman, Mr. J. Coulson Nicol, A.R.I.B.A., having taken the personal superintendence of the work. The contractor for the building was Mr. John Bowen, also of Birmingham.

The trustees of the Friendly Societies' Home have appointed Mr. A. Saxon Snell, F.R.I.B.A., architect for the erection of a home at Herne Bay for 50 patients. The entire cost of the building will be defrayed by Mr. J. Passmore Edwards, who will lay the foundation-stone on Saturday, November 6, at 3.30 p.m.

A new reredos, which has been erected in the parish church of St. Mark, Shelton, was unveiled on Friday. The reredos contains a panel in terracotta modelled by Mr. George Tinworth, and produced by Messrs. Doulton and Co. The scene portrayed in the panel is that on Calvary, at the moment when the Redeemer speaks to his Mother and the Beloved Disciple. The frame of the reredos is in carved oak, by Messrs. Edwards and Sons, of Newcastle-under-Lyme. The holy table is in carved oak, executed by Messrs. Edwards and Sons, and contains three panels in mosaic work by Salvati, of Venice. Messrs. Scrivenor and Sons have designed the whole of the work, and the builder is Mr. Thomas Godwin, of Hanley.

At Christchurch Mansion, Ipswich, the subscription portrait of the present mayor of the borough, Mr. Felix T. Cobbold, by the Hon. John Collier, was formally presented to the corporation by Lord John Hervey. The portrait, a three-quarter length, represents Mr. Cobbold seated in an armchair in his drawing-room at Felixstowe Lodge. Christchurch Park was purchased some years since as a public recreation ground for the townsfolk, and Mr. Cobbold then came forward and presented the inhabitants with the Elizabethan Hall in its centre, which has since been converted into an art gallery and technical schools. At the same meeting, the gift of an old painting of Ipswich and its river from a local banker was also announced. Both canvases will be permanently hung at Christchurch.

OBITUARY.

MR. FRANCIS TURNER PALGRAVE, late Professor of Poetry in the University of Oxford, died on Sunday, at his London residence, 15, Cranley-place, South Kensington, from paralysis of the brain, at the age of seventy-three. The eldest son of the late Sir Francis Palgrave, the well-known historian and antiquarian, by his marriage with Elizabeth, second daughter of Mr. Dawson Turner, of Great Yarmouth, he was born at Yarmouth on September 28, 1824, and was educated at the Charterhouse, and at Balliol College, Oxford. While a skilled versifier, he will be longest remembered as the editor of poetical selections, his best work being his selection of the masterpieces of English verse gathered in his "Golden Treasury of Songs and Lyrics." He was also an art critic of some acumen and judgment. So far back as 1855 he wrote an "Essay on the First Century of Italian Engraving" to Kugler's "Handbook of Painting." In 1862 he compiled a "Handbook of the Fine Art Collections" in the International Exhibition, and in 1866 appeared a volume of "Essays on Art," containing criticisms of the Academy of 1863-4-5 and the Mulready Exhibition at South Kensington, papers on Holman Hunt and Ford Madox Brown, criticism of the Albert Memorial and of Marochetti's bust of Thackeray in Westminster Abbey.

CHIPS.

Mr. W. B. Chancellor has been appointed assistant surveyor to the urban district council of Leek.

At a meeting of Glasgow citizens, on Wednesday last week, the proposal to hold an International Exhibition in that city in 1901 was discussed and formally adopted. The Lord Provost said that the guarantee fund now almost reached £200,000, and the success of the exhibition was assured.

The Leeds Streets and Sewerage Committee have recommended the city council to construct a new street, 36ft. in width, through the Shambles, which are in course of demolition, and thus provide another means of access to Vicar-lane and the Markets from Briggate.

The extensive cabinet-making factory and stores of Messrs. Cumming and Smith, Limited, Glasgow, were destroyed by fire on Friday, damage being caused to the extent of between £6,000 and £7,000. The works and woodyard occupy the greater part of a large square bounded by North Wallace-street on the east, Couper-street on the west, and Kyle-street and Couper-place on the north and south respectively.

On Wednesday week, a musical service was given in the Congregational church at Crewe on the occasion of the opening of the new organ. The instrument, which cost £600, is inclosed in a Gothic case of pitch-pine timber, varnished, with decorated front pipes, and is situate in a chamber provided for it at the back of the rostrum. The organ has been built by Messrs. Nicholson and Lord, of Walsall.

On Saturday a suite of new halls and classrooms erected in Church-street, Dumbarton, in connection with the Dumbarton Parish Church, were opened. The suite, which include a hall accommodating 750 persons, also two lesser halls, committee-rooms, and other conveniences, will cost about £3,000, and are from plans by Mr. J. M. Crawford, architect, Dumbarton.

The decoration of St. Paul's School, Kensington, was completed on Monday by the unveiling of mosaic figures of St. Paul and of Dean Colet on either side of the apse. In the apse itself is the Jowett memorial organ; at the sides there have hitherto been rather painfully bare spaces of wall. These have now been filled by the mosaic figures, a smaller place over the arch of the apse being still left for a figure of Jesus in pueritia. The cost has been £1,200. The mosaics were designed by Mr. Spence.

Colonel A. G. Durnford, R.E., Local Government Board Inspector, held an inquiry at the Town Hall, Gravesend, on Wednesday last week, relative to the application of the town council for sanction to borrow £2,650 for purposes of public walks and pleasure grounds at Windmill Hill. There was no opposition.

A lectern has been placed in St. Paul's Church, Burton, in memory of the founder, Mr. M. T. Bass (father of Lord Burton) and his wife. It has been designed by Messrs. Bodley and Garner, in the style of the 15th century. The eagle stands on a ball, which revolves in a battlemented socket at the top of the pedestal, and holds in its claws a dragon. The pedestal is strengthened with crocketed buttresses, together with flying buttresses ornamented with tracery. At the foot of the pedestal are three lions couchant, and round the base is an inscription.

Building Intelligence.

BANGOR.—The opening of the County School for Girls and of the University Hall for Women Students attending the University College of North Wales took place the other day. The girls' school occupies a prominent site overlooking the Snowdonian range and the sea, the cost of erection and equipment being £3,187. Accommodation is provided for 100 girls. An assembly-hall accommodating all the pupils occupies a central position, and opening into it are four class-rooms, one of which can be thrown into the hall by means of folding partitions. One wing is devoted to the technical department, comprising a cookery classroom and laundry. A music-room is also provided. Under the buildings is a covered playground. The heating is by means of Shorland's ventilating grates to all classrooms, and hot-water radiators to the assembly-rooms, corridors, and cloak-rooms. Externally the schools are faced with Ruabon pressed bricks, with dressings of Cefn stone. The architect was Mr. J. H. Phillips, St. John's Chambers, Cardiff, whose designs were selected in open competition, Mr. W. D. Caroe, M.A., being the assessor. The builders were Messrs. R. and J. Williams, Bangor, Mr. W. P. Williams being the clerk of the works.—In the afternoon Miss Helen Gladstone opened the University Hall for Women, which stands in close proximity to the girls' school. The building, which is in the Queen Anne style, is built of red brick and terracotta, Mr. Frank Bellis, of the firm of Messrs. Grierson and Bellis, Bangor, being the architect, Mr. Evan Williams the contractor, and Mr. Pierce Williams the clerk of works. It consists of a basement and four stories, the main block being flanked at either end by a wing placed at right angles, there being in the north wing the kitchens and servants' offices. Through the building there runs a main corridor, with staircases at either end. Accommodation is provided for 50 students. A special feature in the internal arrangements is the fireplaces, from the special designs of the architect, carried out by Mr. J. E. Edwards, Ruabon. The grounds, which have been laid out by Mr. Wm. Davies, Upper Bangor, include two lawn-tennis courts and a croquet-green. The cost of the building was £5,000.

EDINBURGH.—The plans for the North British Railway Company's hotel and offices, prepared by Mr. Hamilton-Beattie, architect, of Edinburgh, and recently selected in competition, came before the Dean of Guild Court on Friday on an application for warrant to proceed with the erection of the buildings. The application for warrant was granted. The hotel and offices will occupy the site between the North Bridge and the Waverley Market, and are estimated to cost £221,000. The style is described as a free treatment of Renaissance, which has given the architect ample scope in the picturesque grouping of windows, gables, turrets, and chimneys. The main elevation is to Princes-street, where there is a frontage of nearly 200ft., rising six stories from the street level to a height of over 100ft. at the crown of the roof. One of the distinguishing features of this elevation will be the great tower occupying the centre of the façade, and rising to a height of 160ft. There are four stories below the level of Princes-street. The building has a central court about 70ft. square, which has simplified the problems of lighting, access, and ventilation. The principal public rooms of the hotel occupy the west and north fronts on the level of Princes-street. Public restaurants and bars occupy the north-east corner. The North Bridge front at the ground level will be mainly taken up with shops, and the south front is to be occupied by the railway offices. The topmost stories of the entire block will form part of the hotel bedroom accommodation. The main entrance is under the central tower in Princes-street. On the south side of the building has been provided the accommodation for the railway offices, the entrance being from Bridge-street. The four stories below the street level will be utilised in connection with the conduct of the hotel. In all, the accommodation will be as follows:—Public apartments, 21; private parlours, 14; bedrooms and dressing-rooms, 295; sitting-rooms and bedrooms for hotel officers and servants, 146; stock-rooms, 10; and administrative apartments, 262—in all, 748, not including the shops and offices.

GLASGOW.—The question of the decoration of

the new art galleries at Kelvingrove Park is at present under the consideration of a committee of Glasgow Town Council. In their plans and estimates the architects of the galleries set down a sum of £5,000 for sculpture work, in order to keep within the total amount laid down by the Art Galleries Committee. A report has now been prepared by Mr. George Frampton, A.R.A., the special adviser of the committee, suggesting the adoption of a scheme which is estimated to cost about £16,000. The scheme suggests a group of three figures under the central arch of the entrance, to represent "St. Mungo as the Patron of Art and Music," the keystone of the great arch to bear the arms of the city of Glasgow. The tympana of thirty arches over the windows of the ground floor will contain decorative carving, with a scroll bearing the names of the great artists of the Renaissance period, surmounted by the arms of their native city or country. The thirty-six piers dividing these windows will bear clan names; the centre of each of the eight pavilions is terminated by a seated figure symbolical of Music, Architecture, Painting, Sculpture, Science, Literature, Religion, and Commerce; the two north towers each have terminal winged figures in bronze, the one of Fame and the other of Immortality; there will be groups of figures with attributes of the various arts, crafts, and trades of Glasgow; the spandrels of the arches will bear the names of great musicians, and also of historically famous men of Scotland, with the dates of their birth and death. The report has been remitted to Mr. Alfred Waterhouse, R.A., who was the assessor when the competitive plans for the erection of the art galleries were considered.

GOOSE GREEN, WIGAN.—Foundation-stones of a new United Methodist Free Church were laid at Goose Green near Wigan last week. The new buildings are erected on the old site in Northumberland-street and an additional piece of land. On each side of the main building are two class-rooms, divided from the chapel by patent movable partitions. The heating chamber is placed under one of the class-rooms. The whole of the interior woodwork is pitch-pine varnished. The heating is by hot water, and the ventilation will be effected by Tobin's inlets, with patent roof extractors. The chapel will seat 270, and with the addition of the class-rooms 330. The front of the chapel is faced with Ruabon bricks and terracotta, with Cefn stone dressings, the sides of the same and the front of the class-rooms with local pressed bricks, and the base course with blue Staffordshire bricks. The work is being executed by Mr. Alfred Bywater, of Pemberton, from plans by and under the supervision of Mr. R. Pennington, architect, Clarence-chambers, Wigan.

HORNSEY.—The Campsbourne school, erected for the Hornsey U.D. School Board, was opened by Mr. H. C. Stephens, M.P., on Saturday. It comprises a site of 2½ acres, with frontages to four roads, accommodates over 1,400 children, and is arranged in two blocks, one containing a two-story building for the girls' and boys' departments, and the other a single story building for the infants. Beyond the above two blocks a caretaker's house has been erected at the entrance from Boyton-road, and separate buildings have been built for manual instruction and for cookery teaching. Each of the three departments is provided with a separate hall. The girls' department is situated on the ground floor of the two-story building, and contains accommodation for 450 scholars in eight classrooms, grouped round the central hall. This hall is 86ft. long by 28ft. wide, and 15ft. high in the clear. At the south end of the hall is cloakroom accommodation, and at the north end head mistress's room and lavatory. The boys' department on the first floor is a duplicate of the girls' department, and will contain the same number of scholars. The roof to the large hall on the boys' floor has been constructed as an open-timbered one. The infants' block provides accommodation for 510 scholars, in seven classrooms, and an assembly-hall measuring 50ft. by 25ft. is also provided. A feature is a babies' room fitted with circular galleries, on the lines of a theatre. The manual instruction room contains accommodation for 24 scholars, and the cookery kitchen for 40 scholars. The whole of the classrooms throughout are heated with hot-air stoves, and the halls and corridors by a low-pressure hot-water apparatus. The buildings externally have been carried out in stock brickwork, with red brick

dressings and red material finishings. Internally the walls are built to a dado height in brown salt-glazed dipped bricks, and above such dados are finished with buff bricks. The closets and lavatories used are those manufactured by Messrs. Adams and Co., of Old Queen-street, Westminster. The amount of the contract for the works was £20,467, including accessory buildings and playground walls and finishings, equal to £14 10s. 3d. per scholar, and including site to £15 18s. 8d. The works have been executed by Messrs. Kirk and Randall, of Woolwich, from designs prepared by Mr. Howard Chatfield Clarke, of 63, Bishopsgate-street Within, E.C., under whose personal direction the works have been carried out. Mr. W. White, the clerk of works to the Hornsey School Board, was employed throughout the time of erection, and the general foreman of works was Mr. Fishenden.

LEEDS.—A new board school in Harehills-road, Roundhay, which will be known as the Gipton School, was opened a short time since. It stands on a site measuring 7,000 square yards, and has a frontage to the main road of 290ft. There are two departments—infants and mixed. Accommodation is provided for 1,600 scholars, exclusive of special accommodation for cookery and manual instruction, and two central halls. The infants' department is on the ground floor, and consists of a central hall and eight classrooms, two being specially arranged for babies. The mixed department is on the upper floor, where the accommodation consists of a central hall and eighteen classrooms. The elevation is in the Elizabethan style, with two central gables in front. The cost of the building, including fittings, has been £17,000, to which £2,100, the cost of the site, has to be added. It has been erected from designs by Mr. W. S. Braithwaite, of Leeds, architect to the city school board.

ST. BLAZEY.—The parish church of St. B'azez, East Cornwall, was recently reopened after restoration. The fine 15th-century building had been blocked up with high pews and galleries, and all trace of anything beautiful effectually obliterated, while so recently as 1839 a huge gallery was fixed in the west end, completely blocking the tower arch. One thing that made the restoration imperatively necessary was the state of the nave roof, which the deformation of 1839 had divided up into panels by sham plaster ribs. The old Cornish roof with ribs of oak has now been replaced in the nave, and what was left of the old ribs of the aisle roofs has been carefully restored. The galleries and staircases have been entirely demolished. The high pews, some of which were square with seats facing north, south, east, and west, have been removed, and the old floors relaid, blocks being used for the seating part and slate for the gangways. The walls throughout the church have been pointed. The church, though small, is well-proportioned, there being five bays in each arcade, with well-moulded arches and carved capitals, all different in pattern. Mr. Edmund Sedding, of Plymouth, is the architect, and the builders were Messrs. Hobbs and Bartlett, of Rilla Mill, Callington. The outlay has been about £900.

THE METROPOLITAN ASYLUM BOARD.—This authority considered, on Saturday, a letter received from the Local Government Board stating that they had had under consideration the application of the managers for an order authorising the further expenditure of £100,000 upon the erection of the Brook Hospital, and that before arriving at a decision on the matter they wished to be informed, having regard to the great difference between the estimate and the total cost of the works, upon whose recommendation the work was passed, what supervision the managers exercised in the matter, and what steps were taken by them to require a full explanation from the architect as soon as it was found that the estimate was being exceeded. The Board suggested to the managers the desirability of placing the whole of the accounts of the hospital in the hands of a competent surveyor for examination item by item. After a long discussion it was resolved "That the whole question of the Brook Hospital, together with the letter of the Local Government Board, be referred to a special committee for consideration and report, and with instructions to employ a competent surveyor for the purpose suggested by the Local Government Board." It was resolved to apply to the London County Council for the loan of £131,273 for works in connection with the Grove Hospital and the South-Western Ambulance Station, and the purchase of sites for

the Southern Convalescent Hospital and the chief office.

TISBURY.—The ceremony of laying the foundation stone of the new R.C. Church of the Sacred Heart, Tisbury, was performed on the Feast of St. Edward, Confessor, by the Bishop of Clifton. The church, which is being built on the road leading from the railway station into High-street, will consist of a nave 55ft. long by 22ft. broad, with a sanctuary 18ft. square, a Lady-chapel with two bays of an aisle, and a sacristy, with heating-chamber attached. The entrance to the church is to be on the south side through a narthex porch, which will also give access to the staircase leading to the organ-chamber above. The church is in the Early English style, and will be built of Tisbury stone, the interior stonework being of Bath stone. The cost of the whole of the proposed building will be about £1,750, without altars, furniture, and fittings. The site was given by Lady Arundell of Wardour, the Tisbury stone and sand and other building materials being given by Lord Arundell of Wardour. The church is being erected from the designs of the Very Rev. Canon Scoles, of Yeovil; and Mr. J. H. Kitch, of Bridgwater, is the builder.

CHIPS.

Mr. Frederick H. Tulloch, M.Inst.C.E., one of the Local Government Board inspectors, held an inquiry at the Audit House, Southampton, on Wednesday week, as to an application by the Southampton Corporation to borrow £10,076 for the purposes of a new road, quay, and wharf, and £1,260 for works of street improvement at Shirley and Freemantle.

Mr. E. W. Leshmore, Assoc.M.I.C.E., of the borough surveyor's department at Southampton, has been appointed a district surveyor in the engineer's department of the city of Bristol. There were 60 applicants for the post.

There has been a brisk demand for building sites on the land at Keyham Barton, Devonport, which was recently purchased from the manor authorities by a syndicate. Something like 450 sites for houses have already been applied for, and of these 250 have been allotted, representing the first of four sections into which it is proposed to divide the land.

The church of St. Paul, Northwich, was, owing to the salt subsidences, closed on Sunday. In August a portion of the sanctuary floor collapsed. Since then, however, service has been regularly held in the church; but an architect has now condemned the building, as fresh cracks have developed in many parts of the structure. It has been found that the chancel is built upon arches, which are regarded as insecure, and it has, therefore, been deemed advisable to discontinue all gatherings in the church. The roof, main walls, and porch have suffered severely, and entire reconstruction is imperative.

Mr. F. H. Tulloch, Local Government Board inspector, held an inquiry at Bournemouth on Friday with reference to an application of the Bournemouth Town Council to borrow £12,375 in respect of the acquisition of land known as the Dean Park Horse Shoe as a site for new municipal buildings and for other purposes; £10,000 for the erection of a pavilion on the pier; and £2,262 for works of private street improvement. The town clerk (Mr. J. Druitt, jun.), and the borough surveyor (Mr. F. W. Lacey) represented the corporation.

The town hall and municipal buildings at Reading, built 15 years ago, have just been enlarged by the extension of the Free Library and Museum upon the corner site, which has only recently come into the possession of the corporation. The extension, which was opened last week, was illustrated by a double-page sketch in our issue of March 13, 1896, from the designs of the architects. Messrs. Cooper and Howell, of Reading. The works have been carried out at a cost of about £8,000, by Mr. McCarthy E. Fitt, of the same town.

The members of the gas committee visited the Bury Corporation Gasworks on Wednesday week to inspect the installation of pressed-air stoking machinery recently laid down by West's Gas Improvement Co., Ltd., Manchester. The improvements consist in the addition of retort benches on the regenerator principle, an additional stage floor, the raising of the overhead conveyors and hoppers to suit machinery, the fixing of a new coal-breaker, together with an elevator, to act as a duplicate to the existing machinery, and a conveyor from the overhead coal conveyor filling the coal-store. West's compressed-air system of charging and drawing retorts has been applied to the new retort benches, the apparatus including charging machines, drawing machines, air compressor, air receiver, and air-pipes and hose-gear.

Engineering Notes.

INSTITUTION OF JUNIOR ENGINEERS.—The annual general meeting of this institution was held at the Westminster Palace Hotel, Victoria-street, on Friday night, Mr. H. B. Vorley, the chairman, presiding. The council stated in their report that at the end of the 16th session the number of names on the register was 480, as compared with 454 at the end of the previous session—an increase of 26. The receipts for the year amounted to £531 10s. 8d., and the expenditure to £543 5s. 1d. The chairman, in moving the adoption of the report, said the institution was primarily an educational body. It endeavoured to give instruction in every form of engineering, to cover the whole field of engineering work. This it accomplished by means of lectures, &c., and by organising visits to engineering works. Eleven visits of that kind had been paid during the past session. The institution possessed a library of works on engineering subjects, and a number of additions had been made to it during the past session. Mr. Basil Joy seconded the motion, and the report was adopted. The officers for the ensuing year were afterwards elected, Mr. J. A. F. Aspinall, chief mechanical engineer of the Lancashire and Yorkshire Railway, being elected president in succession to Sir A. R. Binnie.

At Tuesday's meeting of the London County Council amended plans for the alterations at Olympia in connection with Messrs. Barnum and Bailey's show were approved. An estimate of £207,400 for the widening of Long-lane, South-west, and the continuation of Tabard-street through St. George's Churchyard into Borough Aigh-street was approved.

A group of municipal buildings, including a free library and public offices, are about to be built for the Workop Urban District Council, from plans prepared by Mr. T. Kidd, their surveyor and engineer. The site is at the corner of Newcastle-street and Watson-road, and the buildings will be of local brickwork, with stone dressings.

On Sunday the Rev. Dr. Norman Macleod, Inverness, opened the new parish church in Tobermory, which has been built at a cost of £2,000. It has been seated to accommodate 300.

Earl Jersey and General Boughiey, Light Railway Commissioners, held an inquiry at Salisbury on Tuesday into the proposals of the Great Western Railway Company to construct a light railway through the Avon Valley from Salisbury to Pewsey, a distance of about 21 miles, at an estimated cost of £116,000. Evidence in support of the scheme was given by Sir Michael Hicks-Beach, Lord Edmond Fitzmaurice, the Mayor of Salisbury, and the manager and chief engineer of the company. Opposition was offered by the War Office, and Sir Redvers Buller, late Adjutant-General, and General Sir Robert Grant both stated that the special military purposes for which the Government bought the extensive land on Salisbury Plain would be nullified if the proposed railway were allowed to run through it.

The great east window of Heckington Church, Lincolnshire, which ranks in magnitude as some fourth or fifth among the Flamboyant specimens in the country, has, through the munificence of Mrs. Little, of Heckington Hall, been filled with stained glass. The seven main lights are divided into a centre triplet and two side couplets, and in them is illustrated the *Te Deum*, and in the tracery the *Benedicite*.

On Saturday, a commemoration-stone was laid in the building now in the course of erection for a parochial mission-hall and clergy-house for St. Silas, Pentonville, from the designs of Mr. William White, F.S.A. The total cost is estimated at £5,500, of which £1,500 goes for the purchase of the site.

Alderman William Collinge, J.P., of Burnley, died on Thursday night in last week at his residence in Southport. Mr. Collinge, who was a cabinet-maker and upholsterer, had long been associated with the town council, and was mayor two years ago.

The Local Government Board have recommended the Public Works Loan Commissioners to lend to the council of Enfield the sums of £6,500 for works of water-supply, and £14,944 for works of sewerage.

Colonel C. H. Luard, R.E., on behalf of the Local Government Board, held an inquiry at the town hall, Wolverhampton, on Tuesday, with regard to the applications which the town council have made for permission to borrow £9,000 for electric-lighting purposes, and £1,000 for laying out St. George's Churchyard as an open space.

NEW POLICE STATION AND COURT HOUSE,
HALIFAX.

The design which we illustrate to-day was awarded the first premium of £50. Its authors are Messrs. J. H. James and Sweet-Escott, of Cardiff. The following is taken from the architects' report:—"The design has been composed with regard to economy, and treated with dignity. The style is Free Renaissance. It is intended to face the fronts with ashlar, and to use, so far as possible, the old materials in Ferguson-street and Carlton-street. The whole of the back elevations will be quite plain. The roofs will be covered with green slates. The floors will be fireproof, laid with narrow oak boards. The cells, sanitary departments, and the areas to be faced with glazed bricks; the other interior walls will be finished in adamant plaster. Fire hydrants and hose to be fixed in handy positions in the halls, landings, and corridors. The necessity of keeping the frequenters of the police-court away from the principal fronts of the building has been considered. The main entrance is towards Harrison-road, as well as the warrant entrance. In addition to this, it is decidedly necessary that those persons who have constant business in the Court, such as magistrates, solicitors, clerks, and also the better class of witnesses, should have free and convenient access to it without the interference likely to arise from their entering or leaving by means of, or even in the vicinity of, a public entrance; such a means of communication is to be had from Blackwall. The Court itself has been placed in a good position on the site, and light obtained from the roof only: the inconvenience produced by side windows is avoided. The magistrates' and solicitors' rooms and clerk's office flank it on the east towards Harrison-road; a situation is thus secured for the Court which effectually guards it against street noises. A spacious lobby is provided for the public and another for the witnesses, also for the magistrates and solicitors, with necessary conveniences; all are well ventilated. Communicating with the yard of the public station is an entrance for the use of the constables and officials, and a staircase leads directly from the prisoners' dock in the centre of the Court-house to the cells' corridor, which is reached by an inclined plane. The police-station is entered from Harrison-road; a charge-room and the superintendent's offices, as well as other officials' offices lead off from the hall

on entering by the main entrance. The cells are entered through an archway from the hall of the main entrance, which leads into the corridor, from which the cells open. The cells are carefully planned in accordance with the Government regulations. The first floor of the building contains solicitors' and clients' rooms, witnesses' and clerks' rooms, &c., with all necessary conveniences; also gaolers' quarters, and accommodation for constables' sleeping-rooms could be easily obtained by the addition of attics in the roof. Ample cellars are given under the building, which includes police recreation-room and mess-rooms, bathrooms and lavatories for police and prisoners, a chamber for lighting and heating apparatus, &c. The portion of the ground at the back left unbuilt upon would be used as a parade ground. The price is thus arrived at:—Cubical contents: 531,965ft. at 6d. per foot cube, £13,299 2s. 6d.; allow for old materials, £700; estimated total cost, £12,599 2s. 6d.—The second premiated design was submitted, we understand, by Messrs. Leeming and Leeming. Eventually the town council adopted another set of plans, marked by the motto "Victorona," by Messrs. George Buckley and Son, of Halifax, and this is being carried out. The borough engineer also prepared a plan, and, if we remember rightly, another abortive competition for the same building was held two or three years ago, when Mr. Cheers was placed first. The report given in the *Halifax Evening Courier* of September 9 last shows that some rather strong language was used when the matter of these late competitive plans were discussed. One speaker remarked upon the doings of the watch committee, saying they resembled the "fratching" of boys playing at marbles struggling to win the most. Retorts about "shady" conduct and sucking other people's brains were indulged in. We pass no opinion on the conduct thus described; but architects should assure themselves of the *bona fides* of the promoters of competitions before sending in their designs. Once submitted, their authors are, to a large extent, at the mercy of a lot of people who know nothing about the merit of their plans, and those who sometimes have their own turn to serve.

WESLEYAN CHAPEL, CROSBY, NEAR LIVERPOOL.

This building is designed to accommodate about 700 worshippers, and has considerable convenience in vestries and classrooms, besides a small gallery at the end over the narthex or main entrance. The work is externally of Yorkshire stone shoddies, with dressed ashlar quoins and dressings. The construction of the walls gives deep reveals to all window and door openings. The whole of the woodwork is of selected pitch pine, the roof and principals being all from the tool, and not stained or varnished. The chancel, with Caen stone dressings, is finished with an arcade and reredos, carved by Mr. Joseph Rogerson. The windows of the chancel are of grisaille work, with a centre subject window by Mr. J. Aldam Heaton. The general contractor was Mr. Samuel Webster, and the clerk of works Mr. S. Gunning. The architect is Mr. J. Francis Doyle, Liverpool, under whose direction the work was carried out. The drawing was exhibited in the Architectural Room at the Royal Academy this year.

FIREPLACE UNDER STAIRS: HOUSE AT BRUSSELS.

This drawing shows the fireplace and staircase, and part of the hall in a proposed house at Brussels. The woodwork will be in oak, fumigated, and the fireplace hood in copper repoussé, with Dutch tiles and red brick hearth. The exterior of the house is half-timbered, with red tile roof, and the principal room in the house, the studio, about 30ft. square, with open timber roof.

M. H. BAILLIE SMITH.

"BEMERTON," CROYDON.

This house is built on a narrow plot of ground with a 40ft. frontage. Owing to the position of the adjoining house the south side enjoys nearly the full advantage of the sun, and is well-seen down the road. The owner has since bought the ground on the north side. The principal idea aimed at in the planning was to get a square, well-lighted hall. The dining-room, though wrong in aspect, has a better outlook than if placed at the back of the house. The exterior is faced with red Wrotham bricks, and front portion is tile-hung. The house was built by Messrs. J. Nicks and Co., 92, Falcon-road, Battersea, with plumbing work

by Messrs. Freeman Bros., of Battersea, from the designs and under the superintendence of Mr. A. W. Field, Architect, London.

BOROUGH SANATORIUM, CREWE.

This sanatorium was opened on October 16 by the Earl of Crewe. The buildings, which occupy a site of five acres, accommodate 28 patients for the treatment of infectious disease, divided over three blocks—16 beds for scarlet fever, 10 beds for typhoid fever, and two isolation wards for one bed each. The administrative building provides accommodation for a matron and the requisite number of nurses and staff. The pavilions are warmed by means of Messrs. Shorland's stoves; the laundry fittings have been supplied by Messrs. Bradford and Co., and the steam-boiler and disinfectant have been supplied by Messrs. Manlove, Alliott, and Co. Mr. John Matthews, of Nantwich, has been the general contractor by whom the work has been carried out at a cost of about £7,000, from designs and under the supervision of Mr. George E. Bolshaw, architect.

A JACOBSEAN CABINET, AND SPANISH AND ITALIAN CHAIRS.

The Cabinet illustrated herewith is of unusual size, it being 6ft. wide, 7ft. high, and 1ft. 10in. deep. The two plain drawers at the base are somewhat remarkable, such adjuncts, in this position, to this type of furniture being seldom met with; otherwise, the general features are those of our old English Buffets or Court Cupboards. There are three doors in upper part, which is recessed, leaving 7in. shelf. This shelf is 5ft. from ground. Below are two drawers with carved fronts. Then the two main cupboards occur; and, finally, the two plain, deep drawers before mentioned. The whole piece is of oak, elaborately carved in front, and with plain sinkings in the framing. It is a recent acquisition by the Bethnal Green Museum. The Spanish Arm-chair is of carved walnut-wood, with crimson velvet seat and back, quilted; its date is about the middle of the 16th century. The sizes are 4ft. to top of back posts, 1ft. 9in. to seat, and 1ft. 10in. wide between front posts, which are 2in. by 1½in. The little Italian walnut Chair belongs to the 17th century. The two top rails are prettily shaped, and, in addition, are slightly curved for the back of a sitter; they are connected by five turned balusters. The total height is 3ft. 7in.; width of back, 1ft. 3½in.; width in front, 1ft. 6in.; and height to seat, 1ft. 7in. Both these chairs are at the South Kensington Museum.

CHIPS.

An alms-box carved in oak, inclosed in ornamental wrought ironwork, has been placed in the parish church of Snath. It has been executed by Messrs. Harry Hems and Sons, of Exeter.

At the Town Hall, Maidstone, on Thursday in last week, Colonel Durnford, R.E., Local Government Board Inspector, held an inquiry with reference to an application by the Corporation of Maidstone for permission to borrow £2,000 in connection with the proposed Victoria Free Library and for rebuilding the Museum curator's house.

H.M. Board of Works have accepted the estimate of Messrs. Mackenzie and Moncur, Limited, for the erection of a large new temperate house in the Royal Gardens at Kew. The erection is to be constructed with iron girders, and teak sashes and sash bars. It is expected the work will be completed in twelve months.

A new schoolroom was opened on Friday at Ellesmere College, which flourishing branch of the Woodard Schools was established in 1884. The school is situated in a charming position in the beautiful Ellesmere Lake district, and educates about 200 students as present. The new great schoolroom is 130ft. long and 36ft. wide, built of brick, with stone dressings, like the rest of the building. Its cost has been £5,002.

At the Cornwall Quarter Sessions last week 20 men were charged with wilful damage to building property belonging to the Headlands Hotel Company, New Quay. The company had erected an office in connection with the projected new hotel. The defendants, with many others, proceeded to the spot, and threw the office into the sea. For the defence it was alleged that the site was common lands, and that the company had no right to build thereon. After a lengthy hearing, the jury returned a verdict of guilty, and the Bench imposed a fine of 40s. each, and bound them over upon their own recognisances, both to be conditional on the finding of the High Court as to the question of right.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ARCHITECTURAL ASSOCIATION OF IRELAND.—The opening meeting of the winter session of the above association was held in the Grosvenor Hotel, Westland-row, on the 19th inst. Mr. R. Caulfield Orpen presided, and amongst those present were:—Messrs. Thos. Drew, R.H.A., President R.I.A.; W. M. Mitchell, R.H.A.; George Rose, M.A.; J. Howard Pentland, R.H.A.; J. J. O'Callaghan, F.R.I.B.A.; C. J. McCarthy (city architect); T. Slevin, C.E.; G. M. Ross; M. J. Buckley; T. R. Scott; George Sheridan, A.R.I.B.A.; R. Butler (hon. secretary); A. E. Murray, R.H.A. (hon. secretary R.I.A.); Chas. Geoghegan, &c. The chairman announced that the Maguire Prize of £10 for a drawing of a building of a style prior to the 18th century had been awarded to Mr. J. Delany, the judges being Messrs. G. C. Ashlin, R.H.A., and T. M. Deane, M.A. Three sets of designs for a suburban villa had been sent in competition for the Ashlin Prize of £10; but the prize had not been awarded, on the ground that the plans received could not be carried into effect for the sum mentioned in the terms of the competition, which amounted to £2,000. Mr. R. Butler, 12 Dawson-street, had been awarded the prize for the best essay on "The Influence of Climate on National Domestic Architecture."—Mr. Pentland delivered a lecture on "Open Roofs," in the course of which he gave an outline of the history of house construction in ancient times, dealing in a concise manner with the various styles adopted by the Pelasgians, Etruscans, Romans, and others, explaining the difference between each and their analogy, in some instances, to modern buildings. The expression, open roof, he said, was not an euphemism, but meant that houses and other structures were made with roofs which were not covered by a ceiling. He gave particulars concerning Italian architecture, dealing shortly with the construction of the domes on ancient buildings and modern European cathedrals. He referred to the flat-roofed houses of the Syrians, and their resemblance to those of modern structures, as also the climatic effects on architecture. Mr. J. J. O'Callaghan, in proposing a vote of thanks to the lecturer, said he had come there in anticipation of receiving great pleasure in listening to the lecture of Mr. Pentland, and he had not been disappointed. He thought that the lecturer might have treated more fully with ecclesiastical architecture, and criticised his remarks on Roman architecture. Mr. Geoghegan seconded the motion, and Mr. Drew having spoken to it, it was carried unanimously. The lecturer briefly replied to the remarks of the previous speakers. With regard to the Romanesque style, he had no doubt that the Romans were better engineers than architects. It was announced that the Saturday afternoon visits to buildings in course of construction would commence on the following Saturday at 2.30 o'clock, the destination being the works in course of progress at the Star Theatre. The visit was being made by kind permission of Mr. Adam S. Findlater, and it was intended that similar visits would be made to various places during the winter season. Mr. Butler proposed a vote of thanks to Mr. Noblett, Cork, for the series of views taken by him during the visit to Lancaster and neighbourhood of the Architectural Association, and also to Mr. T. E. Hudman, for presenting photographs of the groups taken by him on the occasion of the annual excursion of the Architectural Association of Ireland to Mellifont. Mr. Drew seconded the motion, which was passed.

AUCTIONEERS' INSTITUTE.—The new session of this body will be opened on Tuesday evening next, when the inaugural address will be delivered at the Institute's rooms, 57, Chancery-lane, W.C., at 8 p.m., by the President, Mr. James F. Field, F.S.I. The succeeding meetings during the session will be as follows, all being held on Tuesday evenings at 8 p.m.:—Nov. 30, "The Practical Application of the Principles and Law of Dilapidations," by Henry Bushell, F.S.I., Professor of Surveying at the Birkbeck Institute; Jan. 4, 1898, "House and Estate Agents' Commission," by J. B. Matthews, Barrister-at-Law; Jan. 25, "Conversazione;" Feb. 22, "Furniture, Past and Present," by W. Roland Peck, F.S.I., vice-president of council; and March 29, "London Traffic Problems and their solution," by Douglas Young, F.S.I., member of council and surveyor to the City and South London Electric Railway.

EDINBURGH ARCHITECTURAL SOCIETY.—The 11th meeting of the session was held on the 20th inst., Mr. J. A. Williamson, A.R.I.B.A., President, in the chair. Mr. W. A. Mellon read a paper entitled "Half-Timber Work." Mr. Mellon gave an historical description of characteristic examples of the style, both Gothic and Renaissance, and then gave a short comparison between British and Continental work, and concluded by stating how far, in his opinion, half-timber work was applicable to present-day building in Scotland. The paper was largely illustrated by pen-and-ink cartoons by the author.

LIVERPOOL ARCHITECTURAL SOCIETY.—A special meeting of the members of this society has been held at the Law Library, Union-court, Liverpool, to hear a paper by Mr. Joseph H. M'Govern, a Fellow of the society, on "Valuations and Compensations." Mr. J. Woolfall, vice-president, occupied the chair. Mr. M'Govern, in the course of his paper, said that there were many important differences of opinion concerning the method of preparing valuations, and he dealt with these points under the following heads:—(1) Whether a ground rent should be deducted as an annual leakage, like rates, taxes, tithes, repairs, &c., or should it be capitalised separately? He was of opinion that it should be capitalised separately. (2) Should those property tables be used which gave the same rate of interest for a sinking fund as the interest required on the capital invested, or those which provide a lower rate of interest for a sinking fund than for the capital? He thought Hurst's tables should be used, which gave the interest required on the capital, and 3 per cent. compound interest as a sinking fund to replace the capital. (3) Should the same tables be used for a freehold interest as for a leasehold, or should different ones be used? His contention was that different tables should be used, generally 5 per cent. tables for freeholds, and 6 per cent. for leaseholds. (4) Is the difference in value about 5 per cent. between 75 years' lease and a freehold, or does it not reach about 18½ per cent.? He believed that it reached the latter figure. Proceeding, Mr. M'Govern treated of various matters for which compensation was claimed, such as the lowering of street pavements, cutting off of main sewers, railway improvements, subsidences, &c. At the close he was thanked on the motion of the chairman, seconded by Mr. Dodd, and supported by Mr. Bradbury.

A new hotel is to be built at Torquay from the designs of Messrs. E. Appleton and Son, architects, of Torquay and Paignton.

The 200th anniversary of the reopening of St. Paul's Cathedral, which occurs on Thursday, Dec. 2, will be commemorated at that cathedral by a great Masonic service, the tradition being that Sir Christopher Wren was Master of the Lodge of Antiquities, the oldest Masonic lodge in England, which used to meet at an hostelry in the churchyard during the building of the cathedral. It is alleged also that most of the workmen were Freemasons.

Princess Christian laid the foundation-stone of the new parish hall and institute of St. Mary's, Bryanston-square, on the 20th inst. In the basement of the building there will be a boys' club, and in the hall above, which will seat 400 people, entertainments will be had, and it will be fitted up as a gymnasium. There will also be a men's club in the building, and the youth's institute will also be housed there. The contract has been let at about £4,000. Sir A. W. Blomfield, A.R.A., is the architect.

Norwich Town Council have adopted a scheme for enlarging the provision market at a cost of £2,375. They have also ordered a committee to inquire into the question of lighting and paving courts and alleys, of which quite a number exist, the approaches to which are in some instances tunnels 20ft. or more long, about 3ft. broad, and from 5ft. 9in. to 6ft. high.

On Thursday evening in last week at Caldecote, near Nuneaton, Bishop Mitchinson dedicated the reredos erected by the late Captain Townshend. The carving, which has been done in Ghent, is all executed in oak and walnut panelling, with gold pointing. The central subject is the Ascension, whilst at either side appear the patron saints, St. Theobald and St. Chad. In nine smaller niches are represented the orders of the angels, and on the wings of the reredos are the emblems of the Passion. The Bishop also dedicated the sedilia within the altarinclosure, and also a stained-glass south window, erected to the memory of the father of the present rector, and representing St. James, in the garb of a pilgrim, and St. John the Evangelist.

COMPETITIONS.

BLAENAU FESTINIOG, NORTH WALES.—In an open competition for the new county police buildings, the design of Mr. T. Taliesin Rees, A.R.I.B.A., has been selected. The accommodation will include charge-room, cells, magistrates' room, court-room, solicitors' room, witnesses' room, superintendent's office, &c., together with residence for inspector. There were 18 sets of plans sent in.

LEEDS.—The Sub-Markets Committee of the Leeds Corporation held an adjourned meeting on Monday, and further inspected the seventeen sets of plans received for the dead-meat market and abattoir which it is proposed to erect in the city. They selected five sets of plans, which will be submitted to the full committee, and from these a final choice will be made. Just as we are going to press we hear that the committee have selected the plans prepared by Mr. Walter Hanstock, architect, of Batley, who will receive the first premium of £100. The second premium of £50 goes to Mr. Percy Robinson, architect, of Albion-street, Leeds; and the third of £25 to Mr. Fred Musto, of Rawdon. Mr. Hanstock is the architect of the new Corporation Baths in Leeds.

STUDENTS' DESIGNS.—The Technical Education Board reported to the London County Council on Tuesday that Mr. T. Walter L. Emden, a member of the Council (who was last night elected as President of the Society of Architects), had offered a prize of £5, to be awarded next May, for the design of a building, or important part of a building, by a student of architecture attending a school assisted by the board.

CHIPS.

The Lords of the Treasury have sanctioned a grant by the Commissioners of Crown Lands of £100 towards the cost of rebuilding the south porch of the ancient abbey church of Sempringham, near Billingborough, of which benefice the Queen is chief patron and lay impropriator.

The Commissioners of Light Railways held a public inquiry at Helston on Friday, and decided to recommend the Board of Trade to sanction the construction of a light railway from Helston to the Lizard, a distance of 11 miles.

Major-General H. D. Crozier, R.E., held an inquiry in Bradford, on Tuesday, into the application to the Local Government Board for sanction to borrow £50,000 for the purpose of extending the machinery, plant, mains, and effecting improvements in connection with their electricity works. This will bring the corporation's borrowing powers on their electricity works up to £120,000.

The aggregate returns from the Auction Mart last week amounted to £272,939, the highest total recorded for any week this year, with one exception. But this high figure cannot be taken as affording any real test of the condition of the property market, as two large breweries and other securities of a special character were responsible for the bulk of it. Indeed, the general run of business was duller than usual, the most satisfactory feature being the disposal of several town houses and parcels of building land.

Mr. Gerald Buxton, Master of the Brewers' Company, unveiled, on Friday, a life-size statue to memory of Dame Alice Owen, at Owen School, Islington. The monument, which was a leading feature of the Sculpture Room at the Academy this season, is the work of Mr. George Frampton, A.R.A., and it represents the foundress of the school in Elizabethan costume. The head and hands are of white and stained marble, and the rest of the figure is of bronze.

Portman Chapel was reopened on Sunday, having been closed for a year for renovation after fire. Considerable alterations and improvements have been made. A new roof, the gift of Viscount Portman, will afford much better ventilation, while the electric lighting and other additions made by the congregation will be of great service. The total cost of the work has been about £5,000.

The Bradford Building Trades and Stone Exchange was formally opened on Tuesday in last week by a dinner, to which nearly 200 representative persons sat down. Mr. Ellis Robinson, first president of the exchange, presided. Ald. Holdsworth formally declared the exchange open. He explained that for a quarter of a century the quarrymen had met the buyers in the stone trade at public-houses. The growth of the trade in recent years had, however, left them in the position that no public-house was large enough for them, and that had led them to establish these rooms. In conclusion, he coupled with the toast of "The Building Trades and Stone Exchange" the names of the Chairman and Ald. Moulson. Both these gentlemen replied.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 3fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. P.—E. A. C.—F. J. M. and Co.—T. O. C.—P. G. J. and Son.—C. A. B.—R. H. M. Co.

Correspondence.

IRISH AND ENGLISH ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—My attention has just been called to a letter appearing in your columns of the 8th inst. in which reference is made to a communication of mine to a daily journal. Will you permit me to make a few remarks in reply to your correspondent "Goth's" rather severe criticisms? At the outset I am confident that the tone of his letter is not one which will commend itself to your readers. "Goth" appears in some way to resent my letter; why, I don't know. I am not aware that I have said anything personally offensive to anyone. If my remarks have in any way hurt the professional feeling of any English architect carrying out work in Ireland, no one regrets it more sincerely than I do. I think, had my letter been published in full in your columns, there would not have been any likelihood of that.

My object in calling attention to the subject was not, as "Goth" appears to think, to criticise English architects who only act with common sense in accepting any commission which they can honourably fulfil. I have never suggested that Sir A. Blomfield, Mr. Caröe, and the other gentlemen referred to will not carry out their works in Ireland in a manner entirely worthy of their deservedly high professional position.

"Goth" is not satisfied with making a criticism on my letter, but, taking it as a text, proceeds to make an onslaught on the profession in Ireland. He says that some of the work done "could be improved upon by a one-year's pupil." Unfortunately for art, this is a condition of things often common to both England and Ireland.

I am not sufficiently in the confidence of others

to be able to say accurately to what extent "ghosts" are had recourse to; but I am reliably informed that they are not entirely a myth in England. Some colour is lent to this view by the fact that nearly all the leading Irish architects have done their term in the London offices.

It hardly needs a reference to the executed works of such men as Sir Thomas Deane and Son, Mr. W. H. Lynn, Mr. Thomas Drew, and many others equally well-known outside their own country, to refute "Goth's" rather ungracious sneer at the work of modern Irish architects, whether in Ireland itself or in England and the Colonies. Impartial men have always held that, as regards the beauty and extent of its modern buildings, Dublin does not suffer by comparison with any city of its size in Europe. The remarks of Mr. Drew which "Goth" quotes, have, I submit, no bearing on the question he raises.

The reviving of a stale slander in the shape of an anonymous advertisement of two years ago speaks for itself. I happen to have more than a suspicion of the identity of the office pointed at, and I can only say that, whether referring to it or speaking generally, I believe the advertisement to be a slander and dictated by ill-temper.

In no community is there better fellowship amongst architects, or greater good feeling between principal and assistant, than in Dublin; of course, there are "black sheep" everywhere.

As regards "raising a shout whenever anything English is imported," I say, by all means import a thing if it be better and cheaper than you can get it in Ireland; but, as I understood the Dublin bellfounders' case (who, by the way, have a reputation not confined to Ireland), they had no opportunity of tendering for the bells of St. Patrick's, but I did not write in their interests: they are, doubtless, able to take care of themselves. Apologising for the length of this letter, I am, &c.,

R. M. BUTLER.

Dublin, October 15.

CHIPS.

Contracts have been signed, and the work started, for the erection and completion of a new brewery to cost £16,000, for Messrs. Isherwood, Foster, and Stacey, Ltd., Maidstone, Kent, from the plans and under the superintendence of Messrs. G. T. Harrap, A.M.I.C.E., and W. H. Duffield, A.R.I.B.A., engineer and architect, Messrs. G. E. Wallis and Sons, of Maidstone, having secured the contract for the building work.

St. Peter's Church, at St. Leonard's-on-Sea, which was built a dozen years since from designs by Mr. James Brooks, of London, has just been enriched by several screens carved in Kentish oak. They were designed by Mr. Mark J. Lansdell, F.R.I.B.A., of Cambridge-row, Hastings, and executed by Messrs. Harry Hems and Sons, of Exeter, by whom the reredos in the same church was carried out two years ago.

The British Electro Traction Company, Limited, has given notice of its intention to apply next month to the Light Railway Commissioners for an order authorising light railways in the suburban districts of Acton, Ealing, and Hanwell. It is proposed to construct a railway, with a 4ft. 8½in. gauge, from the tramway terminus at Acton Hill, through Ealing, and terminating at Hanwell Broadway.

Mr. Robert H. Bicknell held an inquiry at Colwyn Bay, on Tuesday, re the application of the Colwyn Bay and Colwyn Urban District Council for sanction to borrow £4,936 for sewerage works, £4,000 for promenade works, and £500 for water supply. The application for £4,936 for sewerage works was opposed on behalf of the ratepayers of Old Colwyn. The surveyor explained the details of the works for which the loan was required.

The work of widening Parliament-street has been begun this week. The houses at the northern or Whitehall end of the block which have to be cleared away between the present line of Parliament-street and King-street have been inclosed in hoardings, and already exhibit signs of the professional house-wrecker. The buildings and shops at the southern or Parliament-square end of the block remain tenanted, and are not to be disturbed for the present.

The committee appointed to promote the memorial to the late Bishop of Wakefield (Dr. Walsham How) have unanimously decided that some addition to the Wakefield Cathedral be recommended, and that a recumbent effigy be part of the scheme, the latter to be first undertaken. The committee will consult Mr. J. L. Pearson, R.A., on the subject, and will report back to the subscribers as soon as they have received his reply and suggestions.

Intercommunication.

QUESTIONS.

[11820].—Mahogany or Veneer.—I am on the committee of a co-operative society, which is having fitted up a shop by contract. A portion of the work consists of a number of shelves specified to be made with mahogany fronts, and Californian pine to be used for the shelves. In addition to the above, and in the same contract, the firm agrees to make and fix a mahogany screen. In the course of fixing, it is found that on a foundation of 2in. thick yellow pine there is only a facing of mahogany planted on. When their attention is called to the matter, the contractors say it is the custom of the trade to execute such work in this manner. Can you please tell me in your next issue if such is the fact, and if so why is it necessary to specify in the case of the shelves, which are easily seen, that the material used shall be mixed, while in the case of the screen, where a large portion can be hidden, no such specification is made? Ought the screen when specified mahogany, and we think being paid for as such, to be of mahogany throughout, or does the alleged custom of the trade outweigh a specific contract?—IN DOUBT.

[11821].—Right of Drainage.—In the year 1882 A. buys an estate (No. 1), and to drain it buys a second (No. 2). He afterwards sells No. 2 to B. B. sells to C., who now wants to erect new offices, but is prevented by

local authorities on account of the sewer running under proposed new buildings. Can C. cut off the drain, or claim damages, or what is his best remedy? No mention is made of the drain running through the land in conveyance from A. to B. or B. to C.—QUERY.

[11822].—Substantial Repairs.—Although this expression is so constantly used in connection with dilapidations, I cannot find a definition in any book on the subject. Is the term "structural repairs" synonymous? Could the term "substantial repairs" be properly applied to such things as doors and sashes, or would it be confined to the main parts of the structure, such as walls, floors, and roofs? In a case where a tenant is distinctly not liable for substantial repairs, might he, nevertheless, be called upon to repair roof-slating?—DUBIOUS.

[11823].—Farm Building.—Can anyone recommend a good handbook on the planning of modern farm-buildings?—ONSTEAD.

[11824].—Man-hole Channels for Drains.—In a large institution I have to destroy the old cement channels, and put in glazed open-pipe channel bottoms. The work must be done hurriedly at night, as I can have the flow of drainage stopped for a few hours only. What material can I best bed the channels in and joint them with? I am afraid Portland cement is too slow in setting, and would get washed away as soon as the flow of sewage is resumed, and the quicker the cement is in setting, the more likely is it to "blow" afterwards, on account of its being too fresh. If I temporarily divert the drain round the side of the man-hole, I am in the same fix as to making good where the temporary diversion joins the permanent drain. The only other alternative is pumping to surface, and diverting by means of above-ground temporary wood troughs; but there are obvious sanitary objections to this course.—SANITARY.

[11825].—Breeze Concrete.—In description of the Rowton dwellings last week, the floors are stated to be nailed down to breeze concrete. Will some of your readers describe components of this and thickness? Is there anything between the floor-boards and the concrete, such as a mixture of pitch? To floors on ground level should breeze concrete be laid on top of ordinary Portland cement concrete?—W. M.

[11826].—Measuring Lead Work.—How is the lead to flats and gutters measured? How much allowance must be made for turning-up the lead to walls and roof? How are the rolls and drips to be taken, and the flashings? Shall be obliged for a reply.—A LEARNER.

[11827].—Quantities.—Which is the book generally recommended for those who are studying quantities? How are items such as joinery classified? Is there any order prescribed in the bill? I am told there is not.—J. R.

[11828].—Church Roofs.—Which is the best kind of deals to specify for a boarded roof, which are to be left unpainted? I shall be also glad to be informed how the boarding is finished.—A SUBSCRIBER.

[11829].—Fire-Resisting Curtains.—Can any reader tell me how these are constructed and worked?—AJAX.

[11830].—Carvers' and Carpenters' Workshops.—May I ask your various readers whether they can give me any advice in the following matter? It is desired to build workshops for (1) carvers and (2) carpenters and joiners, and to erect same on the best principles as to dimensions and "light." What is the correct "aspect"? And can any of your readers refer me to a really model workshop of recent erection? Or is there any special book published on the subject?—PROVINCIAL ARCHITECT.

REPLIES.

[11831].—Concrete Floors.—The corrugated sheets between the rolled girders might be strutted from a

temporary platform, though it is hardly necessary with the corrugations. The concrete should be about thick enough to cover the upper flange about an inch or two. The upper surface could be either cemented, as proposed, or floored with boarding by the aid of wooden fillets let into the concrete wood-block flooring would be the best kind to adopt.—TECHNIC.

[11814].—**Concrete Floors.**—We have constructed concrete floors as your correspondent sketches with cross-girders up to 4ft. 6in. apart. No strutting is required, the struts being self-supporting. Thickness of concrete and size of girders depend on span of latter and load on floor.—PETERSON AND CO.

[11815].—**Emigration.**—It is not easy or safe to recommend "A Young Surveyor" as to where he should go. The Colonies are pretty full, and some of them (like New South Wales) overcrowded. South Australia offers a good field for an enterprising surveyor, as there are some parts opening up resources. Adelaide is a thriving city, and is, of course, the chief town, with the exception of Palmerston in the north. Canada affords an opportunity, and Ottawa, Montreal, Toronto, Halifax are important cities. South Africa is developing her railways, and therefore may be named as a place for surveying enterprise, to say nothing of British India. Climate, too, is a consideration that must not be overlooked in making choice. Get a situation first if you can, unless you have means.—G. H. N. G.

[11815].—**Emigration.**—(1) Why should "W.B.E." not try South Africa? As a land of opportunities, though Johannesburg and Rhodesia have been much disturbed of late, there can be no doubt South Africa is a popular centre for emigration. A surveyor who can turn his hand to manual work if necessary is likely to get on, and in the direction of mining enterprises a surveyor is a necessity. A writer on the subject lately said, referring to South Africa, that engineers, surveyors, and miners of ability are wanted for positions of trust; but those of only second-rate qualifications had better remain at home. Anyone who has a handicraft may succeed if he has only the energy. South Africa, he predicts, will be a great empire one day. The climate does not, however, suit all Englishmen. (2) Advertise in leading newspapers here and abroad; also in professional papers like "B.N." (3) An introduction of some kind is essential if you have no employment in view.—ADVISE.

[11817].—**Hospital Construction.**—Though I am not aware of any cheap work, I can recommend "Hospital" to Mr. Saxon Snell's work on "Hospital Construction and their Management"; to the larger and more expensive volumes, full of plans and details, of Sir Burdett; to Sir D. Galton's "Principles of the Construction of Hospitals," a book of moderate size and cost. Many useful suggestions will be found in Sir Douglas Galton's work. But for general purposes, the series of articles which have appeared in the *Building News* and in other casual papers, will be found sufficient for "Hospital's" purpose. The subject is one which in its general principles can soon be acquired; but better than any books is a knowledge of actual buildings like that of the large fever hospital in construction at Tooting by Mr. H. Hessel Tiltman, which we lately illustrated and described, or the other large Metropolitan establishment we lately described at Hither Green. The details can only be learned by personal inspection.—G. H. G.

CHIPS.

At Strathbungo, N.B., a new police and fire station, built at a cost of £17,000, was opened last week. The architect is Mr. A. B. McDonald, of Kelvinbridge, Glasgow.

A handsome oak reredos has just been erected in the parish church of Kirkheaton, near Huddersfield. It is given in commemoration of the completion of the 60th year of Queen Victoria's reign, and in remembrance of William Edwards Hirst, of Lascelles Hall, by members of his family. The work was entrusted to Messrs. Jones and Willis, of Birmingham, London, and Liverpool.

The North Riding Infirmary, Middlesbrough, is being warmed and ventilated by means of Shorland's patent Manchester stoves with ornamental tiled sides, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At the Central Criminal Court, on Tuesday, William Thos. Hooker, 53, builder, of Shirley, near Southampton, pleaded guilty to publishing false and defamatory libels of and concerning Sir Walter Pridemoor, the clerk and solicitor to the Goldsmiths' Company, and was sentenced to twelve months' imprisonment.

An adjudication in bankruptcy is announced in the case of Edward Vigers, Elgin-avenue, Notting Hill, W., and Palace Chambers, Bridge-street, Westminster, S.W., late Parliament-street, Westminster, S.W., architect and surveyor.

The town council of Warrington received on Tuesday a report from a committee recommending that the borough surveyor be instructed to prepare instructions and particulars upon which to invite competitive designs for the proposed police premises. It was, however, resolved to postpone the matter until fuller information could be obtained.

The final meeting of the health committee of the Liverpool Corporation for the municipal year which closes to-morrow was held on Friday in last week, Alderman Cookson, the chairman, presiding, when an illuminated and framed address was presented to Mr. H. Percy Boulnois, who is retiring from the office of city engineer after eight years' service, expressing the unanimous regret of the committee at his severance from the official life of the municipality. The presentation was suitably acknowledged by Mr. Boulnois.

LEGAL INTELLIGENCE.

GUTTING A PARISH CHURCH WITHOUT A FACULTY: CURIOUS CASE.—On Tuesday week, at Derby, Mr. A. Bray Kempe, Chancellor of the Diocese, heard an application for a faculty. The Rev. G. A. Tindall, the rector of Heage, caused the parish church to be closed at Easter for renovation, and proceeded upon a plan he had prepared, to make alterations in the interior of the church. He now applied for the sanction of the court. The alterations in question did not meet with general approval, and objections were made by various parishioners. Mr. Snape, who appeared for the rector and churchwardens, applied for a faculty with regard to Heage parish church, the interior of which it was proposed to reseat and decorate. However, the plans originally put forward by the rector and his churchwardens were disapproved of by a section of the parishioners. The objectors were represented by Mr. Attwood. Mr. Snape said the chief objection was to the proposal to remove the altar from the east end to the middle of the west wall. The objectors had prepared a plan, and the petitioners were willing to accept it in place of the original plan. After hearing what had been done in the church, and that the church had not been used for six months, the Chancellor remarked that the church had been literally gutted without the sanction of the court. Mr. Snape explained that when the painting was begun it was found that the structure was in such a fearful state that parts of it had to be removed. The Chancellor said that for such an interference with the fabric the consent of the court should have been obtained. This had not been done. Mr. Snape said that what was done was done in ignorance. Mr. Attwood pointed out that the church had now been dismantled for six months. The funds supposed to be available for renovating the church were £70 or £80, representing the proceeds of a bazaar, and £100 representing subscriptions promised. After Easter, the church was dismantled, and the work had proceeded some time, when the rector requested Mr. Morrell to sign a receipt in order that money might be drawn from the Restoration Fund. Mr. Morrell declined to do so, and represented to Mr. Tindall that unless a faculty were applied for immediately, proceedings would be taken to restrain him from proceeding with the execution of the proposed alterations. The result was the present application to the court. Mr. Percy H. Currey, architect and surveyor for the diocese, called by Mr. Attwood, said he visited Heage parish church on the 21st September last. The church consisted really of two parts, an old and a more modern portion. The only portion of interest was the eastern end. He thought it was very improper to remove the altar from the east end to the west wall, both from a religious and architectural standpoint, and submitted an alternative scheme. In reply to the Chancellor, Mr. Currey said it would be very undesirable to remove the pulpit. The Chancellor suggested that Mr. Tindall should withdraw the original plan, apply for a fresh citation, and become petitioner in respect of the revised plan, which he was now prepared to accept. Mr. Tindall declined to do so. The Chancellor refused to confirm the application for faculty made by Mr. Snape on behalf of Mr. Tindall as rector of Heage. He ordered Mr. Tindall to pay the costs. Mr. Attwood said his clients could not consent to an adjournment, as they felt it to be a scandal that the church had been allowed to be unused for six months. The Chancellor thought the revised plan was a reasonable one, as well as being the best plan, and thought the vestry might accept it. The instance brought under their notice was a very striking instance of the extreme folly of meddling with a church without first obtaining proper authority. The church did not belong either to the clergyman or parishioners, but was held by the clergyman for the use of the parishioners. Very often irreparable injury might be done to a church, and it was very important that the consent of that Court should be obtained before any alterations were made. He must order the costs to be paid by the petitioners. With regard to the application for the fresh citation by Mr. Tindall, the petitioner would also have to pay the costs.

PROCEDURE AS TO OWNERLESS DANGEROUS STRUCTURES.—THE QUEEN V. MEAD.—Before Mr. Justice Wright and Mr. Justice Kennedy, on Tuesday, Mr. Avory moved on behalf of the London County Council for a rule nisi for a *mandamus* calling on Mr. Mead, the metropolitan magistrate, to show cause why he should not hear a summons under the "dangerous buildings" clauses of the London Building Act, 1894, although it had only been served by being affixed to the premises. The County Council had not been able to ascertain who was the owner of the buildings in question, and accordingly statutory notice had been served by affixing it to the premises. There was no question that the affixing such a notice was sufficient under section 106 of the Act, but the owner must be served personally, or by being left at his residence, as required by the Summary Jurisdiction Act. Mr. Avory referred to section 188 of the Act, and to the

case of "R. v. Mead," and he pointed out that the matter was of great importance, as, if the magistrate's view were right, it would be impossible to carry out the Act in all cases of dangerous structures where the owners could not be ascertained. The Court granted the rule, and made it returnable this day week.

UNSUCCESSFUL ACTION BY AN ARCHITECT.—BROWN V. PONTING.—The plaintiff in this case, heard by Mr. Justice Bigham on Wednesday, was an architect, and the defendant was the owner of a draper's shop in High-street, Kensington. The plaintiff sought to recover £400 for drawing plans for the extension of the defendant's premises; £100 for plans for rebuilding the defendant's premises; £105 for work done for the defendant in respect of negotiations for the purchase of certain vacant land belonging to the Midland Railway Company in Wright's lane, at the back of the defendant's premises; £105 for work done on behalf of the defendant in connection with the promotion of a company which was to be formed for the purpose of acquiring the defendant's business and the adjacent vacant land. The plaintiff's evidence was to the effect that he was introduced to the defendant by a Mr. Slattery, now dead. The defendant told him that he wanted to buy the vacant land in Wright's lane from the Midland Railway Company for the purpose of extending his premises. The defendant also asked him to introduce him to a financial firm or to some solicitors who could promote a company to take over the defendant's business. The plaintiff accordingly commenced negotiations with the solicitor to the Midland Railway Company, and eventually the company offered to sell the land for £45,000. The plaintiff introduced the matter of the proposed company to Messrs. Ashurst, Morris, Crisp, and Co. and to the City of London Contract Corporation, and a scheme was prepared for the formation of a company to take over the defendant's business and to build flats on the vacant land, with an extension of the defendant's premises on the ground floor. The defendant then instructed the plaintiff to prepare plans for the erection of the new buildings and for the extension of the existing premises. The plaintiff prepared these plans. The formation of the company, after some months of negotiations, fell through when it appeared that the annual profits of the defendant's business were £6,000 and not £8,000, the figure originally given. In cross-examination the plaintiff admitted that if the company had been floated he would have received £1,000 from the promoters. Sir Arthur W. Blomfield, A.R.A., stated that the plaintiff's charges for drawing the plans were fair and reasonable. The defendant's story was that Mr. Slattery, who was a total stranger to him, walked into his shop and said that he had a friend named Brown, with plenty of money, who wanted to form a company to buy the defendant's business for a fancy price. The defendant had not been thinking of selling his business, but was willing to do so on these terms. Subsequently the plaintiff was introduced to the defendant, but the latter stated from the very outset that he would incur no liability for the expenses, and the plaintiff must not look to him for payment. He had never ordered the plaintiff to prepare any plans, and the only plan he ever saw was one of the ground floor of the new premises. Mr. Justice Bigham said that he was not surprised that when Mr. Slattery made his proposal to the defendant the latter listened to the voice of the charmer. He would have done better, however, to have told him to go away. Then the plaintiff was introduced and the negotiations commenced. The plaintiff did not intend to do all the work he had done for nothing. He, of course, expected to be paid—but how? His lordship accepted the defendant's statement that he made it clear to the plaintiff that he was not to pay. As in many other cases, the work was done by the plaintiff in the hope and expectation of obtaining his remuneration from the promoters, who, if the company had been floated, would have made a large profit. There would be judgment for the defendant.

The Mersey Docks extension scheme, brought before the Docks and Harbour Board last week, was unanimously adopted by the board on Friday. The expenditure involved, including outlay on works already in progress, will be £4,443,000.

On Sunday a new pulpit, probably the sole example of its kind within the diocese of Manchester, was dedicated for use in St. John's Church, Worsthorne, near Burnley, as a Diamond Jubilee memorial offering. The new pulpit is 5ft. in height, and, with the exception of the floor and handrail of American walnut, is entirely formed of brass. The body of the pulpit is approached by three steps, and is inclosed by wrought brasswork, consisting of a series of panelled arches, and a frieze and dado of brass panels, pierced with a suitable ornament, not so open in character as the arches. The pulpit is octagonal in form, and rests upon a base of the same size and shape, but much less open in style, the panels here, which are pierced, being filled in with solid brasswork.

WATER SUPPLY AND SANITARY MATTERS.

WORCESTER. — Mr. G. W. Willcocks, Local Government Board inspector, recently held an inquiry, at the Guildhall, concerning the application of the city council for sanction to borrow £52,000 for purposes of sewage disposal. The Local Government Board has already approved a site at Digles for the sewage disposal works, and the scheme, which is to replace the approved scheme of Messrs. Hawkesley—abandoned in consequence of the excessive cost—is that of Messrs. Beesley. The scheme proposed to be carried out is estimated to cost upwards of £20,000 less than that of Messrs. Hawkesley, and was awarded first prize in the competition recently decided by Mr. Chatterton. Evidence was taken by the inspector as to details of the scheme, and it was stated that the city authorities were ready to meet any objection from the Severn Commissioners by placing the siphons laid under the bed of the river at such a depth as would enable any future deepening of the river to 16ft.

CHIPS.

At a meeting of the Kingston-on-Thames Jubilee Hospital Committee last week a tender was accepted for the erection of a building to cost £3,580. The foundation-stone will be laid by the mayor on November 6, and the Duke of Cambridge, who gave the site, will be asked to open the building when completed.

At their last meeting the town council of Huddersfield agreed to advertise for a borough surveyor at a salary of £500 per year, and not at "a commencing salary of £500 per annum," as recommended; while in reply to Mr. Barrass, the mayor said that this would not preclude any application at a lower salary.

The progress that is being made with the construction of the Central London Railway is evidenced by the fact that the contractors are now in a position to commence operations with the staircase and subway by means of which passengers will descend to the Bank station from Mappin and Webb's corner.

At the Grand Hotel, Bristol, on Saturday, the Earl of Jersey, Colonel Boughey, and Mr. G. A. R. Fitzgerald, commissioners appointed under the Light Railways Act, 1896, held an inquiry into the Bristol Tramways Company's application for permission to construct a light railway from St. George to Hanham, an extension of 1½ miles.

At Benwell, near Gateshead-on-Tyne, on Wednesday, memorial stones were laid of a new Presbyterian church. The new church, in Armstrong-road, will, when completed, provide accommodation for 650 persons. There will also be a large hall to hold 450, a small hall, minister's vestry, ladies' room, three large classrooms, caretaker's house, and church kitchen. The cost will be £6,000. Messrs. Badenoch and Bruce, of Newcastle, are the architects.

The new hall, in which Castle gatherings will be held, at the Maltland, Inveraray, has now been completed, and on Wednesday the Duke and Duchess of Argyll gave a supper and assembly. A circular granite block above the main entrance bears the inscription: "Destroyed by fire, 1817. Restored by George, 8th Duke of Argyll, 1897." The building is 120ft. long by 40ft. wide and 45ft. high, with a raised dais at the west end and a gallery at the opposite end, which will be used as a tea-room. The illuminating power at night is derived from eight large incandescent Swan lamps of 150 candle-power each. The work has been carried out under the direct supervision of Mr. Wyllie, chamberlain of Argyll. Kitchen and supper-rooms have been erected in the rear of the main building.

The foundation-stone of a new swimming-bath at Harrogate was laid on Saturday. A private company has taken the matter in hand, and secured a site on the Dragon estate, facing Skipton-road, containing 2,775 yards. The cost of the land, buildings, and furnishings is estimated at £5,500. The bath proper is to be 75ft. long and 30ft. broad. On three sides of the room there will be galleries for the accommodation of spectators at entertainments. It is proposed to erect on the premises a recreation-room, with two billiard tables and also a refreshment room. Mr. H. E. Bown is the architect, and the contractors are:—Mason, Mr. S. Nettleton; joiner, Mr. J. W. Rhudd; plasterer, Mr. Fortune; painter, Messrs. Jessop and Cosgrove; ironfounder, Mr. Bagshaw (Batley); slater, Mr. Shepherd; heating apparatus, Mr. J. Robinson; plumber, Mr. Allan.

St. Luke's Church, Southport, has just been fitted up with elbowed stalls in English oak, and there have also been placed in the church a pulpit of oak on an alabaster base and a triptych and reredos likewise carved in oak. The work has been carried out by Messrs. Harry Hems and Sons, of Exeter, under designs by Mr. Huon A. Matear, F.R.I.B.A., of Liverpool, the architect of the church. The cost has been about £1,500.

Our Office Table.

EARLY in December last the London County Council determined to continue the services of Mr. Thomas Blashill, F.R.I.B.A., the superintending architect, for another year, although he had reached the age-limit, on the ground that his retirement would cause inconvenience to the public service. At Tuesday's meeting of the Council it was now again reported that the year for which Mr. Blashill's services had been continued was about to expire, and recommended that he should continue to hold his appointment for another year. Mr. Blashill was in good health, and was willing to place his services at the disposal of the Council for another year. The recommendation was unanimously adopted.

THE twenty-eighth annual exhibition of specimens of turning in wood and pottery, under the auspices of the Turners' Company, was opened on Wednesday at the Mansion House. The exhibits are few in number, owing to the great activity in the turning trade; but the judges report that "the excellent quality of the work is generally maintained," and they express their satisfaction at the increase in the number of the apprentice competitors. The pottery exhibits are stated by the judges to be "probably as numerous as they have ever been"; but the opinion is expressed that "in point of merit they scarcely come up to the standard of five years ago." The judges of the exhibits in wood are Messrs. Burdett-Coutts, A. Bevan, A. Murray (the city surveyor), George W. Budd, and G. W. Taylor; and the judges in pottery are Messrs. W. Brindley, W. Rome, A. S. Murray (British Museum), and Lieutenant-Colonel A. J. Copeland. The first prize in the wood exhibits—which has been awarded to Mr. F. Powers, Eastfield-road, Andover, for a rose window, or centre flower, in oak, constructed of four pieces of turning—consists of a silver medal, the freedom of the company, and, subject to the consent of the Court of Aldermen, the freedom of the City of London, and five guineas. The first prize in the apprentices' class has been gained by L. G. Seegar, of Lyndoch-street, Kingsland-road; and in the amateurs' class, first certificates of merit have been awarded to Mr. S. A. Harding, Inglewood-road, West Hampstead, and to Mr. W. H. Lowndes, of Church-street, Aylesbury. In the pottery exhibits the first prize—which is precisely similar to the first prize given in the wood exhibits—has been gained by Mr. S. Stocks, Upper Kennington-lane, for a terracotta vase thrown in one piece. The first prizes in the apprentices' classes have been awarded to Arthur Newman, A. Kerridge, E. B. Martin, John Lovekin, and F. W. Millward. The Rev. Charles C. Ellison exhibited—but not for competition—a tobacco-box carved in ivory. The exhibition will open to-day (Friday) between 11 and 2.30, when the prizes will be handed to the successful competitors by the Lord Mayor.

PONTEFRAC, the Roman station and city, and long afterwards celebrated as the last fort which withstood the assault of Cromwell's Ironsides, is seeking to distinguish itself in a fresh direction in civil life. Having completed two years' service, the borough engineer, who had received an increase in salary, recently applied for another rise. This has been made the keynote in the electoral addresses of candidates at the Municipal elections on Monday next. One gentleman, who says he means to go in without any mistake, says: "My first work will be to reduce the borough surveyor's salary by £80 a year, and I will use this money in giving all the working men in the employ of the corporation an advance of 2s. a week in their wages. . . . We are being robbed on all hands and sides, and that is why the rates are so high; but I'll bet my bottom dollar that if you send me into the council I'll stop all that sort of thing, and reduce the rates from 7s. to 2s. 6d. in the pound." The interesting old town abounds, says a correspondent in a neighbouring town, in blind alleys, large middens or privies, and houses of ill-fame, maintained for the garrison, and, it is alleged, most of these wretched hovels belong to councillors. The middens are emptied once a month, a heap of filth, containing about six yards cube, being wheeled out from each of the courts at or before eleven at night and fetched away after eight in the morning. Under these circumstances it is not wonderful that there was recently a severe outbreak of diarrhoea and enteric fever. The population of Pontefract is about 16,000. There

are about 20 medical men in the town, all enjoying splendid practices. A large infectious diseases hospital, to cost about £6,000, is in contemplation.

In their report for the year 1896-97, the Commissioners of Public Works in Ireland review the several departments of their operations. Under the Railways (Ireland) Act, 1896, the Lord-Lieutenant has given certificates for the following schemes:—(1) Letterkenny to Burton Port, County Donegal, railway, 49½ miles; (2) Buncrana to Carndonagh, County Donegal, railway, 18½ miles; (3) Belmullet, County Mayo, to Achill Sound, County Mayo, steamer, 20 miles; (4) Killybegs, County Londonderry, to Dromod, County Leitrim, steamer, 105 miles; (5) Tarbert, County Kerry, to Listowel, County Kerry, coach, 12 miles; (6) Tarbert, County Kerry, to Killybegs, County Londonderry, coach, 9 miles; (7) Ennistymon, County Clare, to Ballyvaughan, County Clare, coach, 16 miles. The first three deal with subjects for the development of congested districts. The fourth affects the long stretches of country between Killybegs and Dromod on both sides of the Shannon. A line of steamers, available for tourists, and for certain traffic, has, since the end of the financial year, been started by the Shannon Development Company, with a subsidy under the Act. Of the three remaining schemes, the coaching arrangements between Listowel and Tarbert and the steamer between Tarbert and Killybegs give facilities for communication between Kerry and Clare. The service from Ennistymon to Ballyvaughan, aided by steamers starting from the latter place, connects Clare with Galway. These schemes have been brought into operation since the end of the financial year. The Grand Jury of County Donegal have given their assent to the second scheme—that for a line from Buncrana to Carndonagh, and made a presentment in aid of it. The projected line from Letterkenny to Burton Port has been approved by the Grand Jury, and a presentment made in aid of the undertaking. The loans sanctioned during the year for improvements under the Labourers' Dwellings and Housing of the Working Classes Acts amounted to £83,242.

The site of the prehistoric Celtic lake village near Glastonbury has been further excavated since July last, under the superintendence of the discoverer, Mr. Arthur Bulleid. The sites of the dwellings are marked by mounds. One of these contained the greatest depth of clay yet found, no less than 9ft.; the accumulation of successive hearths which were found necessary as the weight of the clay gradually compressed the peat beneath. This mound contained 300 tons of clay, all brought in boats from the neighbouring hills. Under the mound was found the framework of a loom with brushwood and wattlework to form the foundation. In addition to other things connected with the spinning craft, no fewer than 40 horn and bone carding combs have been unearthed, and no two of these are exactly of the same pattern. The number of broken bone needles and splinters of bone found in one mound seem to indicate that it was utilised as a needle factory. Another mound was very rich in fragments of pottery and other evidences of the manufacture of hardware. Ten bronze fibulae were found, these being fashioned almost exactly like the modern safety-pin. Two bronze studs, probably a part of harness or for fastening clothing, were also discovered, together with other small bronze articles. An iron file about 8in. long was found. As usual, very few human remains were discovered, part of the skeleton of a very young child being all that was brought to light this summer.

The trustees of the National Portrait Gallery, in their fortieth annual report, just issued, record sixteen donations, bequests, or loans, and thirty-one purchases during the year, making the total number of purchased exhibits 533, and of exhibits given or lent 625. The number of pictures on the walls of the gallery is given as 933, of works in sculpture 123, and miscellaneous portraits exhibited in cases 29, making a total of 1,085 portraits exhibited. The attendance of the public continues to be very satisfactory, and it is evident that the historical value and history of the collection is beginning to be very widely recognised. The total number of visitors during the twelve months ended April 3, 1897, was 254,942. The highest total of visitors previously recorded, while the gallery was at South Kensington, was 146,187, and this was in the year of the International Fisheries Exhibition. Of the total number, 226,634 were admitted free of charge, 16,684 on payment, and 11,624 were admitted on Sunday

afternoons. In pursuance of their desire to promote the educational influence of the collection of national portraits, the trustees have agreed that parties from schools wishing to visit the gallery for educational purposes can be admitted free on students' days, on notice being given to the secretary stating the number of the party.

"MOUNTAINEER" writes, under date October 22:—"I was inspired yesterday by the present fine weather to ascend Snowdon. Upon reaching the summit I was sadly astounded to find a brick wall built across a large portion of the peak. It extends almost along the fine new hotel, and blocks its front door and is so high as to obscure the building from the Llanberis path. It also extends from the corner of the hotel for about 60 yards down the slope towards the tramroad station. Upon making inquiry the workmen informed me that it is Mr. Assheton Smith, of Vaynol, who is building the wall; but they could not assign any reason why such a wall is erected in such a public spot. Most assuredly the proprietors of the hotel will contest their right of way to the hotel, and I feel as equally certain that Sir Edward Watkin, in conjunction with the Beddgelert Parish Council, will see that the paths are not obstructed. A public protest should be instituted against the wall." "Another Mountaineer" complains that the railway and the new hotel have between them spoiled the summit for everyone but the tripper; while a kitchen midden is being formed which would make any inspector of nuisances condemn the whole place as an unsanitary area.

THE National Photographic Record Association, which has for its object the establishment of a national collection of photographs, to be permanently kept at the British Museum, has now been fairly launched. Sir Benjamin Stone, M.P., has been appointed president, an influential council has been elected, and Mr. Alexander Graham, F.S.A., V.P.R.I.B.A., and Mr. George Scamell fill the offices of treasurer and hon. sec. respectively. The council have just issued an appeal to those interested in the subject to assist in bringing together a truly national photographic record of all existing objects of interest, as well as scenery, life, customs, and history of the time.

The annual general meeting of the Incorporated Society of Medical Officers of Health was held at the Holborn Restaurant on Saturday evening, Dr. E. Seaton, the president, in the chair. A vote of thanks having been passed to Dr. G. P. Bate, the retiring president, the council presented their report for the past session, from which it appeared that at the end of the session the society numbered 674 members, as compared with 678 last year, and that there were now nine branches in different parts of the kingdom. The report was adopted. The chairman afterwards delivered his presidential address, the subject of which was "Medical Societies in their Relation to the Public Health Service."

CHIPS.

During the months of February, March, and April next there will be held in the Walker Art Gallery at Liverpool the Spring Exhibition of Architectural Drawings, Arts, and Crafts. A feature is to be made of the photographic art and appliances, and of works of art in black and white, while special rooms will be allocated to architectural drawings and applied art, in celebration of the 50th year of the Liverpool Architectural Society.

The parish church of All Saints, Wragley, Lincolnshire, was reopened last week after refooring with wood blocks and the substitution of open seats for the high-backed pews. Mr. W. Scorer was the architect, and Messrs. Halkes Brothers were the contractors.

The infants' school at Raunds was reopened last week after enlargement and improvement. The alterations and extensions were intrusted to Mr. W. H. Lovell, of Raunds, Messrs. Talbot Brown and Fisher, of Wellingboro', being the architects.

Mr. Medlicott, the engineer appointed from India, arrived at Larnaca in the island of Cyprus on Monday for the purpose of undertaking the irrigation works sanctioned by the Home Government.

The work of laying out the historical Temple Meadow at Bridgnorth as a pleasure ground has been completed by Messrs. Hswitt and Co., landscape nurserymen, of Solihull and Edgbaston; and a bandstand has also been erected to the memory of the late Mr. H. Baden Southwell. Mr. W. O. Foster, of Apley Park, generously gave the ground, which contains the oft-photographed and sketched leaning tower.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Engineers. 7.30 p.m.
Royal Institute of British Architects.
Inaugural Address by the President,
Professor Geo. Aitchison, A.R.A. 8 p.m.

TUESDAY.—Auctioneers' Institute. Inaugural Address
by the President, James F. Field, F.S.I.
8 p.m.

Institution of Civil Engineers. Address
by Sir J. Wolfe Barry, K.C.B., President,
and Presentation of Medals. 8 p.m.

WEDNESDAY.—Carpenters' Hall Free Lectures. "Sanitary
Construction," by Prof. Banister Fletcher,
F.R.I.B.A. 8 p.m.

Edinburgh Architectural Society. "The
Evolution of the House," by A. N.
Paterson, M.A., A.R.I.B.A. 8 p.m.

St. Paul's Ecclesiastical Society.
"Linen Vestments in North Italy," by
Dr. J. Wickham Legg, F.S.A.; and "An
Early Irish Tract on the Consecration of
a New Church," by the Rev. T. Olden,
M.A., St. Paul's Chapter House, E.C.
8 p.m.

FRIDAY.—Architectural Association. "A Proposal for
Classifying Builders' Work," by S. Flint
Clarkson; and "Some New Materials
for Use in Building," by H. D. Searles-
Wood, F.R.I.B.A. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

NOVEMBER 5th, ORDINARY GENERAL MEETING,
9, Conduit-street, W. 7.30 p.m. Mr. S. FLINT CLARKSON,
"A PROPOSAL FOR CLASSIFYING BUILDERS' WORK," and
Mr. H. D. SEARLES-WOOD ON "SOME NEW MATERIALS FOR
USE IN BUILDING."

E. BOWLEY SIM, } Hon Secs.
G. B. CARRILL, }

Trade News.

WAGES MOVEMENTS.

LANCASTER.—The plumbers of this town struck on Tuesday for an increase of one penny per hour and the abolition of compulsory short time in winter. They are paid 7½d. per hour, which they state is under the average. Compulsory short time in winter is declared unnecessary, the innovation reducing wages by 4s. when most required.

MANCHESTER.—The Manchester and District Builders' Labourers' Society have given the employers six months' notice of their intention to seek a readjustment of the conditions under which the men work, and an increase in the amount of wages they receive. The notice will expire at the beginning of April next. The Building Trades Federation of Manchester and Salford have promised their support to the men.

NORTHWICH.—The Amalgamated Society of Carpenters and Joiners of Northwich and district have decided to ask the masters for an advance in their standing wages. They complain that brick-setters are receiving 9d. per hour, while they are only in receipt of 8d. Their application is to be placed on an equality with the bricksetters.

STRIKE OF CORNWALL STONEMASONS.—Over 400 stonemasons are on strike in the Penryn, Constantine, and Mabe granite districts, owing to a dispute between the stonemasons engaged at the Keyham extension works and the contractor. The men living across the river ask for time lost in crossing, which is refused by the contractor. A number of labourers are also affected, and some 40 masons employed by Sir John Jackson on the Keyham extension works have struck work in sympathy.

The first of the year's series of art lectures, to be given in the Glasgow Corporation Galleries, was delivered on Saturday evening to a crowded audience by Mr. F. H. Newbery, headmaster of the School of Art. Treating art as a sojourner, the lecturer instanced her alliance with barbarism, with paganism, with Christianity, with literature, and in these later days with commercialism, treating briefly on each of these relations.

Surveys are being prepared for the construction of a deep-level electric railway connecting the London, Brighton, and South Coast main lines on the south of London with Euston, St. Pancras, and King's Cross. The proposed line will pass through the heart of the West End, and will have a station in the Strand, close to the great hotels and the theatres.

Mr. Abraham Pilling, J.P., of Roe-lane, Southport, died on Wednesday evening in last week at Lindley, near Huddersfield. He was born in Lindley rather more than 77 years ago, but removed to Bolton, where he built up an extensive business as a railway and general contractor. He entered the Bolton Town Council in 1862, and after serving six years became alderman. Nearly twenty years ago he removed to Southport, and in 1883 he entered the town council, remaining a most active member until November, 1895. He was twice mayor.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2235.

FRIDAY, NOVEMBER 5, 1897.

LEARNERS AND WORKERS.

A GREAT deal is expected from the architect in these days. He is not only to be an expert mathematician, a draughtsman, and well up in the archaeology and learning of his profession, but to be in addition a good surveyor and business man, well versed in the technical branches of his profession. While one school of teachers impress on the student a long course of academical lectures and class instruction, another equally enthusiastic set of teachers advocate that the young architect should be able to put his hand to any trade, and be taught to handle the materials and tools. As it is impossible for the student to follow both these classes of teachers, he naturally looks for counsel and guidance as to the course he should pursue. His time and opportunities after he leaves school are limited; he has to serve a three years' apprenticeship, and to equip himself for the practical duties of a profession at once exacting and arduous. Strange to say, this guidance is not afforded by the responsible authorities of the profession. If we take the inaugural addresses of two of the leading bodies, we shall find very little light thrown upon the question we have mentioned. At the Association Mr. Hampden W. Pratt dealt with the question as to "What made an artist?" and his quotation from Ruskin seemed to point to the imaginative or artistic qualities as being regarded more necessary than manipulation or calculation. He dwelt on the importance of co-operation and association, of assisting others who work with the architect—fellow-designers and craftsmen. The Association in the past has done good service in encouraging the two divisions of study, the elementary and scientific or constructive, and the classes of design and colour decoration have been exceedingly helpful; but they have still left the question unsettled for many as to which branch of the profession they should devote themselves to. It is right to provide means to assist members to supplement the training they acquire in the offices to fit themselves for their work as architects. For this end the school of design is doing, no doubt, good work; but the difficulty is to select for each individual the course for which he is best fitted. One party tells the candidate he must go through the whole curriculum of four or five years, the other that he must become expert in the workshop. Facts speak better than opinion. We hear that while in one of the divisions of the Association the attendance of members is satisfactory, in the second and advanced division it is disappointing. Is it not that young men cannot spare the time, or are indisposed to do so? We have to face such a fact. We cannot make young members what they might and ought to be: the only thing the teaching powers can do is to help and facilitate. Is it not also a fact to be recognised, and dealt with accordingly, that those who have the artistic gift and abilities, and can do the best architectural work are the least tractable workers?—aye, the least fond of sustained study? We cannot close our eyes to the fact, however we may wish to do so. The men who read well, and satisfactorily answer the questions set at the examinations, are generally deficient in design. They are made of a different stuff;—they make excellent learners, but poor designers. And is it not the duty of the teaching bodies to boldly recog-

nise the distinction, so as to be able to meet the requirements of both these classes of men—the plodding student and the imaginative artist? Is it not possible that separate rules should be applied to these distinct classes, instead of trying to bring them under one unalterable standard? The "architect and surveyor" is a combination of talent which seems to fit in with the dual-qualified man, but we have never been able to see their real connection. Useful in co-operation they undoubtedly are, especially in the country; but the man who can make valuations and take off quantities is not likely to succeed as a designer. Each loses by a connection with the other vocation. By insisting that a student must follow the whole curriculum or programme sketched out by the modern architectural school, we only make him a crib or a second-rate architect. Design and construction stand quite apart from those qualifications which fit a man to become an expert estimator or surveyor. Many architects tack on the title of "surveyor" to make a living, whereas it would be better for them to include with buildings, furniture, decoration, or even engineering design. No doubt there may be a sort of vanity in thinking that these things are *infra dig.*; hence the combination we have named. But what has designing a building to do with valuing it or making out dilapidations, or assessing a light-and-air case?

Then there is a different attitude towards architectural design. The man trained by books of styles, examples, and dates, who has to pass an examination in sketching and describing features of ancient buildings, mouldings, and the like, thinks of his art very differently to one who is trained in crafts and the treatment of materials. The former looks upon his training as sufficient to enable him to design a town-hall or a church in correct 13th century, or Perpendicular, or Classic, as the case may be—to "design in any style." The latter looks upon such a doctrine as completely derogatory to the calling and dignity of the architect. The two views are utterly opposed, but which is the orthodox one? Are our teaching bodies pledged to the academical view? Do they not expect the examinee to be well up in all styles—the leading features and mouldings which distinguish each period; to be able to illustrate and explain by sketches each feature, such as a broach spire and a typical window of each of the four Gothic styles, with plans of jambs, &c.? If this scholastic scheme of education is the right one, it would be preposterous to expect a young architect to learn any one trade properly. What with the surveying and the scholastic, the mathematical, and the draughtsmanship, his time when he leaves school would be fully occupied. Professor Aitchison, at the Institute, truly said that architecture had been in the wood since the 15th century, and could not progress till it got out of the wood; he hinted what the aim should be, but no practical suggestion was made.

Next we are confronted with those who look upon art through building and workmanship. One looks at it from the outside, the other from the inside; one studies styles and features, the other motives. It is, indeed, to this latter class we have to look for progress. They have initiated workshop demonstrations in stone and woodworking and metalwork, and by the aid of the Technical Education Board our architectural societies are now enabled to give instruction in branches of the building art which, up till lately, have been impossible. Not many years ago the young architect thought it *infra dig.* to concern himself with the trades, or anything outside his office, although a few of our leading architects had risen from the bench; but this idea was to be expected at a time when architecture was mistaken for archaeology. Now, we hear lecturers actually advocating workshop experience,

and even apprenticeship to a trade, such as a mason or a carpenter, before he serves his articles. This is taking the bull by the horns;—to become efficient designers one ought to know how things are made and how workmen handle their tools. To talk of design of masonry, or woodwork, or iron-work without, is like trying to learn to write without knowing anything of the meaning of words or of grammatical rules. To a certain extent it is quite true. But it is not necessary that a man should be a mason or a carpenter before he can design in stone or wood, nor is it necessary for him to be an expert in handling tools. And these wide statements have the effect of discrediting much of the teaching we hear on these topics of late. Some people say that an architect should learn the crafts and be able to work in them, forgetting altogether the calls on his time in other directions. What is required is that he should know practically the methods and means of execution which necessitates a certain time in the workshops. A more prolonged or detailed acquaintance with the crafts would very likely rather restrict his inventive powers as an artist. The architect has to create and arrange, and perhaps no exercise of a manual kind is so valuable to him as modelling. The sculptor-architects of the Italian Renaissance period knew the value of modelling, but we have too little of it now. Every accessory of architecture, sculpture, decoration, metal-work, ceramics, was then allied to the mother art—now are carried on as distinct crafts; the old alliance between them has been broken. All technical facilities, unless based on an artistic sympathy, will rather tend to widen the breach between them. These are questions which we look to our art societies to answer. In the mean time there is a great deal of misdirected labour and study going on amongst architectural students. Those who would do better in the studio and the workshop are wasting their time in copying examples and studying books on the history of architecture; others, who are better scholars and collectors of information, are losing time in attendance at technical classes and workshops. In practice, too, we have men in the wrong spheres of work—men of art and feeling doing surveying and mechanical drudgery; designers of furniture and stained glass or metal-work employed in offices which crush out all that is artistic; while, on the other hand, the larger portion of our important buildings fall to the lot of scheming business men in the profession whose inclinations and training have in no sense fitted them to be architectural directors or to secure the best art. Our municipal buildings are examples of the forced alliance between art and practical conditions—how little the architect has been able to make his building anything better than an ornamental shell for the various offices of the locality. So also the improvements and buildings in our cities and towns have been deficient in the character we expect from them. County councils and municipal corporations have spoilt their best streets by confiding them to a class of men who care little for artistic arrangements—men who have learned their professions according to the received order in offices of surveyors and engineers, and who have no special training in the other branches of their art. We need only point to the many lost opportunities shown in our London streets: how much has been left to accident, and how little has been tried to redeem our buildings from positive unsightliness.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE inaugural meeting of the sixty-third session of the Institute of Architects was held on Monday evening, the president, Professor George Aitchison, A.R.A., in the chair. In

opening the proceedings, the President remarked that, since the last meeting, one of their members had had conferred on him the distinction of K.C.B., and the least they could do was to congratulate him on gaining one of the very few honours that were granted to that body—he referred to Sir John Taylor.

The President then delivered his

OPENING ADDRESS,

in which, he said, he proposed to consider how the Institute could, with a reasonable hope of success, improve the art it had been specially created to cherish and advance. The unravelling of the great problems of humanity and the extraction of the lessons they teach are, he proceeded to remark, beset with difficulties, and some of these difficulties are apparently insuperable on account of our ignorance of the factors. We cannot suppose that among the two parties who alternately govern us, and help to mould our minds, to direct our aims, and to modify our desires, there are not on both sides upright and devoted men, whose views are as the Poles asunder; and it is only by long experience that the value of the measures carried can be judged of. At the time of the discussion of such measures the partisans of the scheme are as sure of its excellent results as their opponents are of its pernicious effects, and as the clashing of the opposing views causes heated, angry, and acrimonious debates, so I fear that suggestions of improvement may have the same effect amongst us. In considering architecture, we must take the existence of two things into account—namely, the set of the public mind and the occurrence of genius, and though we most urgently want genius in every branch of skill and knowledge, we have not the faintest notion of the causes of its production. The utmost we can do is to offer it ample opportunities of learning what it wants to learn, and to bestow our thanks and admiration upon its possessor and his works. The other cause of excellence is

THE SET OF THE PUBLIC MIND

in a certain direction; but why it sets in that direction is at present unfathomable, though we may roughly indicate that its set is always towards those pursuits that promise power, wealth, and delight. We may, however, say with certainty that in this age it does not set in the direction of architecture. If the genius of all the great architects that ever lived were combined in one, and that one had the chance of showing it, the architecture that he would produce would have little or no effect on the public, for the public now gets more in that direction than it either desires or deserves almost for nothing, and is perfectly ungrateful. The set of the public mind is so important a factor that we can hardly overestimate its importance. Men whose turn of mind is in the line of that of the public generally decry all attempts at systematic teaching, and proclaim that all schools and universities are mere shoddy-making factories that turn out a colourable imitation from waste. When in the past there has been a sudden demand by a city or a nation for some kind of knowledge or skill of which there was a deficient supply, the head of that nation or city had no better remedy to offer than the creation of schools, academies, and universities, where the requisite knowledge and skill should be taught or tested, and where it was hoped they might be learned. This was the method adopted by Constantine the Great when he chose Byzantium for the capital of the Roman Empire, and caused to be built there copies of the Senators' houses in Rome, and of their villas in other parts of Italy. So apparent was the want of competent architects and skilled workmen, that he offered a premium to those who would have their sons brought up as architects, and to skilled workmen who would bring up their sons to their own trades. May we not say that Santa Sophia, one of the masterpieces of the world, was the outcome of this teaching? After the irruption of the barbarians in the West there was a great want of both architects and skilled workmen, and the ecclesiastical authorities endeavoured to supply that want by founding schools in their abbeys and monasteries. Again, at the time of the Saracen irruption there was a dearth of architects and skilled workmen, and this want was tried to be met by schools and universities connected with the mosques: and there was again the same want in the days of Charlemagne, and the same methods were adopted. All the systems but one offered teaching to all who came, and, we presume, who showed some aptitude; but Constantine only

offered his premiums for learning architecture to young men of eighteen years of age who had received a liberal education. Looking at the enormous extent of the knowledge required by an architect, and the almost antagonistic powers of mind required, would it not be

BETTER TO CONFINE ARCHITECTURAL TEACHING TO ARCHITECTURE?

As architecture is pre-eminently a constructive art, construction should certainly be its foundation—the very last thing that would be thought of now, for the aesthetic architect would leave that to the builder and the engineer. It seems ludicrous not to insist on an architect who is to build having such a knowledge of statics as to know the proper method of resisting the force of wind, of water, and of earth, and the thrusts of arches, vaults, and domes. Statics would give us, too, important lessons in aesthetics, for it gives us the proper proportions of each part of a building when we know the height, the weight to be carried, and the strength of the material to be used. When these particulars are known and provided for, we may roughly say that we have only to accentuate the important parts by mouldings, or have them adorned by the sculptor to make them into architecture. The architectural student wants also to know how to plan conveniently and beautifully, to make his building wholesome, and finally to give it the shapes and ornaments that proclaim its destination, and are appropriate to that destination. The literary, goldsmithing, painting, and modelling architects of the Renaissance left us one pernicious legacy, for their aim was to imitate Roman architecture, and from their teaching the Gothic revivalists have wanted to imitate Gothic, and the Greek revivalists have wanted to imitate Greek, though the Italian Renaissance architects gave grace and artistic perfection to their Roman models. This procedure of imitating the construction and aesthetic expression of a Pagan people who flourished 1,200 years before the Renaissance seems a mistaken one, for architecture is a progressive art, not only in the scientific part of construction, in the increase of material wants, and the introduction of new materials, but also in the aesthetic part, for no two successive generations like exactly the same forms, nor are the emotions that should be raised exactly alike. You certainly should not ignore the advances made in the architecture of the immediate past. It was not wise of the Renaissance race to ignore former advances in construction, and it was hardly possible to go back to pure Roman Paganism, however hard they tried. If we want to advance we must follow the example of the Mediaevals: we must study deeply, observe accurately, reason logically, and be never deterred by failure, and endeavour to express the leading character of our time, which is the getting an insight into Nature's laws and applying them to our wants. We must, too, endeavour to discover what we and our employers love to see embodied in our works, and how that embodiment should be expressed. In England we have artificially divided the constant increase of skill and knowledge, and the fluctuation in taste of the Gothic architects, into styles which we call "Early English," "Geometric," "Decorated," and "Perpendicular." But these so-called styles were gradual developments. The first Gothic architects developed the mouldings of the Romanesque; the grouping of two or more lancet windows under an arch suggested a hole in the spandrel, afterwards cusped with the new Saracen feature, and so on; and as skill increased and taste decayed, the tracery of the enormous Perpendicular window grew mechanical and ugly. It is only by increase of aesthetical and constructive knowledge and the development of necessary features that any characteristic features of our own can be stamped on our architecture. When a race has had enough wit to invent mouldings on which the sunshine of its own country played the harmonies that it loved, how can these mouldings be transplanted into another country with a different atmosphere and a different sunshine, and produce the same effect? And if they could, are these the precise effects we want to produce now? Anyone who can appreciate the beauty of mouldings, and has seen Greek architecture at Athens, cannot fail to observe how absolutely ineffective these mouldings are in the misty atmosphere of London, particularly when there is no sunshine. The only other architects who understood the art of moulding were those of the Middle Ages, after

what we call Gothic was developed; their mouldings are perfectly effective in misty weather, but are too coarse and hard when there is full sunshine, while they are at all times wanting in grace. Yet the art of moulding is as much neglected now as the science of statics. No one can give genius, nor does it seem in one man's power to turn the desires of mankind in the direction he desires. You can, however, try to drive away from the profession, by a thorough examination, all those who do not love architecture better than anything else; and though this love does not always insure the possession of genius, it mostly does. Having got the proper sort of men, you can see that they have that necessary knowledge and skill that would enable them to use the divine spark properly if they have it. Architects are not born with a knowledge of statics, nor of the strength of materials, nor of the art of planning, nor of how to express the emotions that each particular structure should evoke, though we now see ornaments from the palaces of the Cæsars, or from the boudoirs of Renaissance beauties, lavished on tailors' or oyster-shops, and on banks and insurance offices. I have seen the ghastly ornaments of Roman temples, bullocks' skulls, on a bank; but I looked on these as the monogram of the architect.

THIS INSTITUTE IS A UNIVERSITY

—i.e., it does not teach, but it examines, and informs students what they should know and where some of their information can be got. Among some the idea of teaching is almost a mania, and some things must be taught: the pronunciation of foreign tongues, the use of a foil or an oar; but the art of teaching is mainly non-existent. Unfortunately no real textbook has been written on architecture, though all but how to produce the emotions proper to any structure may be picked up from various books. Those architects who can produce the proper emotions have something else to do than to explain the means they employ, even if they could explain them. And the knowledge, too, of the means used to produce emotions will not give the power to produce them, or else all the real critics of aesthetics would be poets, painters, sculptors, architects, or musical composers as well. Architects must study and paraphrase those buildings and those members of buildings that have produced the proper emotions in them. An architect must also recollect that those who are to be moved by his building are not Greeks, Romans, mediaevals, nor Italians of bygone ages, but the people of his own country and his own time. Still, if you can touch the master chords of humanity, they are not so very differently attuned now from what they were in the earliest times. We can at least see that an architectural student has the knowledge that he cannot properly do without, and we shall find that this alone will have a very good effect on the profession; but it is almost impossible to divest men's minds of cant. The student is asked to know all sorts of things, some of which are interesting, some pleasant, and some dull, that have no bearing on architecture. It is only by studying Nature's works and former buildings, and deducing laws from them, that we can hope to cultivate that sense which makes us like one form and detest another. Such a study is necessary, therefore, for those who wish to become architects; for though a knowledge of statics will make our buildings safe and prevent a want of due ratio between the parts, we must trust to a cultivated eye, till the laws are discovered, to make them beautiful, majestic, or sublime. We should make our students first design in old-world materials, wood, brick, stone, and marble, so that their designs can be compared with the existing successful monuments; but we have new materials which have to be brought within the pale of architecture. We cannot do better than

MAKE STUDENTS DESIGN IN CAST IRON

when they have succeeded in designing in the old-world materials. It is too expensive a material to disregard its statical conditions. It is difficult to arrange a column or a stanchion so that its capital may securely carry a heavy superstructure with a large base. It is difficult to make the base of this column or stanchion wide enough to transmit safely the weight it bears on to a foundation of much softer material; there are difficulties in the design of mouldings and floral ornament that can be cast; and there are absolutely no examples to imitate, so that the knowledge, care, skill, and invention of the

student are called into play. We cannot believe that the ingenious Mediæval architects would have foregone the use of such valuable and powerful materials as wrought iron, cast iron, and steel on account of Mr. Ruskin's objection that they were not mentioned as building materials in the Bible. Nothing can be effected in a structural art like architecture, by talking; but when a man is lost in a wood, and you can direct him to the road out of it, you have done him most effectual service. Architecture has been in a wood since the 15th century, and it can never progress until it gets out of this wood. The intelligent architectural student wants to know the mark he is to aim at, and how he may hit it; and I am afraid the general opinion would be that he is to learn to sketch in perspective, and when he asks what he should sketch, he would be told everything that appears to him interesting, striking, or beautiful, because when he gets into practice he will find that the public may ask him to build in any style the world has known. A good instance of the ignorant instructing the wise! He should be told that he has first to learn how to construct, and that the aim of architecture is to make of each building an organism like Nature's, fitted to fulfil its duties as perfectly as possible without waste of material, and to make it properly tell the tale of its purpose or purposes, and that if sculpture and painting can be afforded, he is to use them to tell its tale more completely. When the Associate's curriculum is amended, I would

REDUCE THE EXAMINATIONS TO TWO, a matriculation examination and a final one, for two reasons: first, because time would be saved; and, secondly, so that each student might keep up the knowledge and skill he had acquired. Professor De Morgan used to say that when an examination was passed, the students thought all the knowledge required for passing it might be forgotten, and looked on his asking again for subjects they had once passed as a fraud, as if they were asked to pay a second time when they had the receipt for the first payment. The final examination should include a certificate that the candidate has acted as clerk of the works on some building for at least six months, to familiarise him with real work, and to impress on his mind that it is building, and not drawing, that is wanted. These amendments would greatly improve the condition of architecture; but architecture would be more improved if there were an examination for Fellows as well. The complaint is that there is a dearth of Fellows, and a proposition is made like that adopted by the giver of the Scripture feast, that we should send into the highways and byways, and compel them to come in. There would surely be no need of compulsion if it were felt to be an advantage and an honour to be a Fellow. It has been said that eventually every Fellow must have been an Associate; but the present conditions of the Fellowship offer a way to escape examination. No one objects to see really distinguished architects being admitted by acclamation; but at present there are only three real qualifications for the Fellowship—that the candidate is thirty years of age, is honest, and has been seven years in practice;—though it is true that the council look at the drawings turned out of his office. The only objection to a proper examination of Fellows is that it is absurd to expect it from men of thirty years of age who have been seven years in practice. The physicians and surgeons saw the force of this, and though their examination may take place at twenty-one years of age, the title cannot be assumed until they are twenty-five. The Fellow's examination should only be more complete than that of the Associates; and the candidate should have a certificate of having acted as a clerk of the works for a year, and made out the necessary full-sized diagrams for the work on the floor. I am rather surprised that architects do not see that

DEGREES OF EXCELLENCE ARE POSSIBLE IN ARCHITECTURE;

or, if they do see it, that they do not act on their convictions. The greatest living architects are contented with the same remuneration for their work as the apprentice just out of his time, and merely seek to get into a wholesale business. This greatly helps to degrade the profession in the eyes of the public, and gives a very wrong impression of the facts, as every architect well knows. I cannot help desiring to see the pursuit of architecture followed on sound principles, nor can I forget the absence of any system in my youth; for then, after you had drawn out

examples of the Greek and Roman Orders, genius was supposed to do the rest. One sees to what lengths

A PROPER ARCHITECTURAL EDUCATION

may lead from mere savagery in the architectural triumphs of the Middle Ages. If the true architectural high road could be again found all might hasten to the goal, and not belike the dragon's teeth when the stones were thrown into the middle of them. Who knows that in the case of the right road being found the public might not again take a passionate interest in the excellence of our art, as it must have done at the great epochs? Modesty is a charming virtue in all, and especially in those of great intellectual endowments; but if this modesty is only to make us idle and worthless, let us throw it off. Let us no longer say we are so inferior to the ancient Greek, Roman, Byzantine, Saracen, Mediæval, and Renaissance architects—that it is no use trying to equal them. Have we relinquished the courage, daring, and self-reliance that once distinguished our race? If we have, we must be contented to lag behind the rest of the world. If we are not equal to former races, and particularly to the Romans we so much resemble, it is because we have got into a wrong road, and I would rather see architects take up the position of our ambassador at the Court of the father of Frederick the Great than be ready to confess that the English are hopelessly inferior to the great architectural races. Frederick William had a regiment of giants, and paraded them in front of our ambassador, and asked him if he thought an equal number of Englishmen could beat them. The ambassador said he could not say that, but he would undertake that half the number would try. I firmly believe that the race has not degraded, and that if we will only again take up the right way of learning we shall astonish ourselves and the world.

Mr. H. HEATHCOTE STATHAM proposed, and Mr. ALEXANDER S. MURRAY, LL.D., seconded, a vote of thanks, which was carried by acclamation, and was briefly acknowledged by the President.

THE SOCIETY OF ARCHITECTS.

THE thirteenth annual general meeting of the Society of Architects was held at St. James's Hall, Piccadilly, S.W., on Thursday evening in last week, the chair being occupied by Mr. Robert Walker, J.P., of Cork, the retiring President.

ELECTION OF OFFICERS AND COUNCIL.

The scrutineers reported that 84 voting papers had been returned, all of which were valid. The following was the result, all the officers having been unanimously elected:—President, Mr. T. Walter L. Emden, J.P., London; vice-presidents, Major F. Seymour Leslie, R.E., London, and Mr. Silvanus Trevail, F.R.I.B.A., Truro; hon. secretary, Mr. Ellis Marsland, London; hon. corresponding secretary, Mr. Edgar Farman, London; hon. treasurer, Mr. H. G. Quartermain, Merton; hon. auditor, Mr. W. R. Mallett, London. For the twelve seats on the council the following were elected:—Mr. C. A. Bassett-Smith, London (83 votes), Mr. George Edward Bond, Rochester (84), Mr. William Cooper, St. Leonard's-on-Sea (83), Mr. R. W. Coventry Dick, London (84), Mr. Herbert J. Jones, Bristol (80), Mr. A. J. Lacey, Norwich (82), Mr. J. R. Manning, London (84), Mr. R. Lano Pearce, London (83); Mr. George Henry Phillott, M.A., Cheltenham (82), Mr. George Gard Pye, London (83); Mr. Thomas R. Richards, London (83), and Mr. R. Frank Vallance, F.R.I.B.A., Mansfield (84).

Mr. Walker then vacated the chair in favour of the newly-elected President, Mr. EMDEN, who, after returning thanks for the unanimous call to the chair, proposed a hearty vote of thanks to his predecessor in office, who had, at great sacrifice of time, expense, and trouble, travelled from Cork each month to preside over their meetings, and had done so with a geniality, eloquence, and business-like tact that rendered it hard to follow him in the chair.

Major SEYMOUR LESLIE seconded the motion, which was carried by acclamation.

PRESENTATION TO THE RETIRING PRESIDENT.

The President, again rising, said he had to offer Mr. Walker, on behalf of the Council and members of the Society, a gold medal as a small recognition of the services he had rendered them during the years in which he had occupied that

chair, and a testimony of the good wishes which he carried away with him on his retirement. The medal (which was executed by Messrs. Spink and Son) is of solid gold and is 2in. across. On the obverse it bears the Jubilee bust of her Majesty, as reproduced on the coinage, while the reverse contains within a wreath of laurel and olive the inscription—"Presented to Robert Walker, Esq., J.P., President of the Society of Architects 1890, 1891, 1893, and 1897."

Mr. WALKER, in reply, expressed his thanks, and said that from the first the interests of the Society had ever been dear to him, and he had ever striven to the best of his ability to promote its welfare. He was one of those who took part in the conference of architects held at Freemasons' Hall nearly a dozen years ago, at which the federation of the profession was mooted, and was a member of the committee which eventually developed into the Architects' Registration Bill Committee. Although at present progress in Parliament had been blocked by the pressure of business and the indifference of the outside public, he had no doubt that ultimately they would obtain registration for architects, and he urged the members to use every means in their power to educate the profession and the public as to the desirability and utility of the movement.

Mr. G. GARD PYE moved, and Mr. B. R. TUCKER seconded, a vote of thanks to the retiring members of Council. This was carried unanimously, as were similar expressions of appreciation with regard to the hon. treasurer, Mr. H. G. Quartermain, proposed and seconded by Messrs. SYDNEY MARSLAND and WILLIAM COOPER, and humorously acknowledged by that gentleman; and to the hon. secretary, Mr. Ellis Marsland, proposed from the Chair and seconded by Mr. T. R. RICHARDS. Mr. MARSLAND, in replying, urged each member to do all in his power for the welfare and progress of the society, and especially by endeavouring to secure large attendances to their monthly meetings; there was yet much work for all to do. The services of the scrutineers, Messrs. David Peacock and E. W. Harvey Piper, were acknowledged in the concluding vote of thanks, proposed by Mr. WALKER and seconded by Mr. J. R. MANNING.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

AN ADDRESS TO STUDENTS.

THE winter session of the Birmingham Architectural Association was opened on Friday evening last by an inaugural address from the President, Mr. Charles E. Bateman, A.R.I.B.A., of Edward-street, Birmingham, and the Sanctuary, Westminster. Remarking that he proposed to speak as a student to students, he referred to the benefits derived from association with other workers, which counteracted some of the dangers of isolated study, while the stimulus of rivalry with others, when not pushed too far, beneficially affected our capabilities, and a man who had to meet the difficulties of actual practice could not make himself too strong. The time of study might be looked upon as the sowing time for a harvest much of which would be gathered by others, and of which the best, the seed-wheat, was that reserved for future efforts. If we were, he added, to search for the true spirit of architecture, we must look deeper than at the mere arrangement of the materials, grouping, and details of a building, to obtain from it as a work of art the full degree of pleasure and interest it can afford. We must look upon it as the outcome of the characters of those who created it, influenced, as it is certain to be, by the characteristics of the owners, constructors, and designers, and by the spirit of the times in which they lived. The character of the architect stands out, perhaps, as the most evident, because in the nature of things he is more in touch with its conceptions, having to see it in his mind's eye from the earliest stage throughout to the completion. An architect's own house, with its finishings, perhaps gives us the clearest insight into his own character, although from an artistic point of view it is frequently one of the least satisfactory of his works, owing to the want of some dominating idea, such as a client often expresses by his instructions, and really requires, by the force of his special circumstances. What human characteristics are displayed in many of our modern buildings! They have all the commercial spirit of the times in which we live; business needs are held to demand that every foot of ground area

shall be utilised by careful planning, while supports are minimised by the use of iron and steel-work to the utmost degree possible. Even upon the surface this characteristic is visible: advertisement is written all over, and permeates the costly pretentiousness of its architectural treatment. Would so much money be expended upon the façades if it had no such business justification as to call public attention, backed by the desire to go one better than the tradesman opposite? We should not indulge in futile lamentations over this spirit of the age; on the contrary, it remains for us as artists to turn it to account. There is no reason why the spirit of trade competition should not prove a gain to us instead of a disgrace. Look at Belgium and see what was accomplished in its towns and cities through the agency of commerce 300 years ago. Literature has been defined as "thought expressed in words," and so may architecture be defined as "thought expressed in material." Take whatever building we will, erected for some definite purpose, and we find that purpose expressed either consciously or unconsciously. Thus a church, a Roman Catholic building, or a chapel cannot be mistaken for more than a moment, however disguised. Even a High or Low church ritual finds expression, as it has been said that churches, such as St. Alban's, Birmingham; Hoar Cross; St. Augustine's, Kilburn; and St. Augustine's, Pendlebury, will be a monument to the ecclesiastical revival. What a contrast there is between, say, Forthampton Court, which we went over at the excursion this year, and some of the other country houses!—the former the home of the squire, the latter the show-place of successful financiers. The factory, the shop, the theatre, the office block all bear upon the surface the purpose which caused their erection, and which is independent of the style adopted for the elevations, and arises from the individual requirements that have governed the plan, influenced the arrangement of door and window openings, and often dictated the materials and style of treatment employed. The architect's skill is proved by the way in which he handles these elementary conditions of the problem, which it is for him to convert into means of artistic effect. What a chance there is to be grasped in the much neglected factory! In these the ordinary materials might be disposed in large masses and surfaces so as to produce the effect that strength and industry produce upon us, such an impression as we receive in the contemplation of the outcome of the concentrated efforts of many human beings directed towards one end. It has been said that architecture is the art of pleasing, and if this is so, the question then arises, Whom are we to please—the general public, or the more limited number of educated persons of cultivated and refined taste? Let us include, to satisfy as well as to please, and then, I think, we might be able to serve both masters. In the arrangement of the building we ought to satisfy the requirements of the building owner representing the public, while by its graceful expression of construction, by the proportion and detail we must please the higher authority. I think it is not a bad plan to take some great architect as our master, and without copying too exactly his work, which we should study on paper, ask ourselves at each turn the question if he would have met the problem in this or that way, and if he would be pleased with our solution and rendering. In course of time our own capacity and individuality will make itself manifest. We must never be down-hearted when we hear our efforts run down by the uninitiated, or over-elated by their praise, because so often neither their praise nor blame is worth considering; but it is a great help to obtain and accept, without irritation, a true criticism from a higher authority than ourselves. One of the great factors of our life, and which we cannot withstand if we would, is the part which is played by mechanical contrivance. The engineer has become part of our every-day existence. In almost every department he supplies the wants and and comfort of national progress. Who can realise the outcome of the application of steam and electricity? These discoveries in themselves create new wants, and these wants dictate fresh methods of construction, that element which has been, and ever will be, the fundamental principle of real beauty in architecture. The first thing we were told in our Latin grammars, and which we all remember, was "Balbus is building a wall"; but in future it will be "Balbus is fitting a wall." Consider, for instance, the real facts of the employment of iron and terracotta.

What is it but fitting? And so it will, and must, go on while present conditions last, until eventually building will be for the most part nothing but fitting. I have no doubt that, if only peace and wealth continue to be accorded to this country, and some method introduced for the avoidance of strikes, which are practically civil war, with the artistic capacity of all students fostered and drawn out, some beautiful style of building will be produced, based upon this constructive element. We are, however, now in a transitional stage, and do not know quite where we are. Thus the most extraordinary results are produced by the compelling force of new problems, while at the same time we continue to employ forms and details from buildings erected in other ages and climates, and under entirely different conditions, and are disappointed that we do not realise the unattainable atmosphere of ancient work. Our work must, of necessity, be English, fulfilling the requirements of Englishmen and an English climate, constructed by English workmen, and criticised by educated English people. We should, therefore, hold, in the first place, to English prototypes, and, I think, in this lies the great value of the summer excursion of our own and the London Association, together with the visits to old and new buildings. It is of the utmost importance to study present-day architecture, and which is facilitated to so great a degree because, who ever heard of a member of the Association refusing to grant permission for us to go over his buildings and learn how his mind was brought to bear upon the site, materials, and instructions of his clients? It is in this way, more than in any other, that we shall be able to build up a national style or method. These remarks must not be taken as a negation of the advantages of foreign travel; an architect must know from actual observation, and both by measuring and sketching, something of the great examples of his art existing in other countries. Caution is needed in such study of Continental work, because the scale is often so vast that when we try to reproduce some fine example in whole or part reducing, as we shall be compelled to do from a $\frac{1}{2}$ in. or $\frac{1}{4}$ in. scale down to a $\frac{1}{8}$ in. or even $\frac{1}{16}$ in., we shall be surprised to find that the effect produced is very different from what we expected would be the result. A great deal has recently been said about the workshop and craftsmanship influence that ought to be brought to bear upon architectural training and design, and while such influences may certainly exercise a welcome restraint in bringing us face to face with the limitations of our materials and the difficulties of execution by the workmen; still, even this is a hobby-horse which may be ridden to death. It unfortunately seems to be the general impression that the practical and artistic cannot be present at the same time; but I think that this is quite a fallacy, because who ever heard that one of Nesfield's or Norman Shaw's houses was unworkable or uncomfortable, or that a church by Bodley or Pearson was not eminently fitted for its purpose? I cannot but think the historians of the future will find much of interest when following up through the architecture of the 19th century the predominating idea of revival which has been in progress during the last hundred years in ecclesiastical matters, painting, sculpture, literature, music, book-illustration, furniture, &c. First of all came the Greek, just when the tradition of Wren and Inigo Jones was dying out; then Gothic of the different periods, followed by Renaissance of various types, some of which are still running, finishing with Spain, the last explored country. Finally, we come to the revival of Georgian types, as practised just now by Shaw, Brydon, Pite, Mountford, Blomfield, and others. The whole will be worked out with variations, according to the taste, or want of it, by individual designers, until we shall be obliged to begin the circle afresh, unless we allow our altered conditions to work themselves out in the materials that we have to hand. The cry that architecture is dead in this country I think we can most emphatically deny. A possibility of doing something occurs in every building or addition to one, if only the right brains and trouble are brought into play. The same materials can be obtained as formerly, and in many instances as much cost may be expended, the great difficulty being the time instructions—to-day sketch-plans, tomorrow working drawings, next week details perhaps, or supplied by the various sub-contractors, which are cheaper and perhaps more

workable. It is this which retards us so much, but which, fortunately, affects the largest buildings least. If the Oxford municipal buildings had been 10 or 20 small separate jobs, could the same amount of time and thought have been expended upon their finishing and detail? What a joy it must be for a client to say, "Take your time over it," or, as in the case of a London bank, "Spend what you like, but make no show"! At no time have there been so many agencies at work to facilitate building operations. Men with the highest brain-power and capacity are engaged in providing materials and manufactured articles for insertion to meet the various requirements, until we sometimes are compelled to think that we are merely selectors, and not creators at all. How few of us decline to accept the services of the pattern book, and, if we would, are sometimes not permitted to do so by our clients, who carry us off to choose the latest thing in tiles, fireplaces, &c., and expect us to be pleased with what, if left to ourselves, we should prefer to know were dropped in the sea, together with their casting patterns! This is a condition which, to some extent, works against us, and hides the individual, and perhaps the most interesting thing about a building is its individuality and expression of thought, which is far greater than costliness or richness of material. We all, I think, would sooner look at a well-proportioned and carefully designed plain deal door than acres of thoughtless panelling in oak. Now, as to what steps we should take to qualify ourselves for producing works of interest, and typical of the highest phase of the age in which we live. This Association gives us the greatest opportunity for doing so, as it is run, or should be run, for this aim alone, and if we have sufficient enthusiasm to make the sacrifice required to attend the meetings and classes, we shall also be able to make it later on, so as to give additional thought and trouble to our work without which no great work has yet ever been produced. We cannot hope for all, or even one, of our efforts to be considered as a masterpiece;—for this the talent of genius is required; but whatever talent power or ability there may be provided in us by nature we may strengthen and cultivate through the working of our Association. The first duty we have in life is the provision of maintenance for ourselves and those who are dependent upon us; the second, our duty to our clients in the performance of the work for which we are paid; and then there is the *gift*—the provision of something over and above our actual duty, and it is our privilege in life to assist in making the city, town, and village more interesting and pleasing to the eye and mind of the passer-by, occupant, and visitor. If I might give a little working advice to a student, I think in the first place that we must thoroughly grasp the requirements for which the building is intended, by the study of how these requirements have been met elsewhere, and then we must so arrange the walls and openings which are the plan, so as to meet these requirements in the best possible way. Having got so far with our plan (preferably to a small scale), we should then consider our roof, because it is the walls and roof which provide the shelter—and building is but the provision of shelter—while architecture consists in that atmosphere of art or beauty which is attached to that shelter. If we are fairly satisfied with our plan, heights, and roof, a clay model might be made at this stage which will help our perception of the grouping immensely, and if this bears out our perception, we may commence the more careful drawings in pencil. Before, however, inking-in or finally deciding, it is best to commence the $\frac{1}{8}$ in. drawings of plan, section, and elevation of every part, endeavouring to design and show what the full-size details will be, in the $\frac{1}{8}$ in., making them proportionate to the space they will occupy. After this follows the full size. What hours we can spend, and are often spent, upon a single section! And during the whole process of thinking out, how many of our sketches, books, photographs, and illustrations have not been referred to! All this time you must remember that nothing has yet been inked-in, and the next step is to make the $\frac{1}{8}$ in. agree with the full size, and when this is satisfactory, the $\frac{1}{8}$ in. scale must be made to agree with the $\frac{1}{4}$ in., and, if this is satisfactory, to commence inking-in, remembering all the while that what we are doing is only a means to an end, and that it is the conversion into material that is the consummation. If we are fortunate to have a friend whom we think

more talented than ourselves (which, perhaps, is almost an impossibility), get him, during the preparation of the sketches, to tell us what he really thinks about them, and follow it. Then the actual building should have our greatest care, and the more time we can spend upon our early works, the better will be the result. Not being too conceited to listen to the advice of experienced and painstaking workmen, or too weak to stick to our own carefully-considered opinion, we should always try and bear in mind that the building is to meet some definite requirement, and that we are the persons to provide it, at the same time trying to give it that atmosphere of beauty which it would not possess if constructed simply by undirected labour. Should irritations spring up either with the builder or building owner during construction, stick to the job, and, if possible, pull it out of the fire, for the building will be living when the owner, builder, and architect are dead and buried, and all their jars and differences forgotten.

LEIGH HUNT MEMORIAL, HAMMERSMITH.

ON Thursday, the 28th ult. (yesterday week), an exceedingly interesting ceremony was performed at the Passmore Edwards Public Library, Hammersmith, when Mr. A. E. Fletcher unveiled the bronze medallion portrait of Leigh Hunt, which has just been erected in the vestibule of that building as a companion portrait to that of Charles Keene, the famous *Punch* artist, which was put up by public subscription early in the present year. Mr. George Frampton, A.R.A., is the author of both plaques, and his work is of the highest order of merit. The Leigh Hunt portrait is based upon Lawrence's picture of the poet and Cosmo Monkhouse's description of him. The tablet is surmounted by two beautifully-posed, seated figures emblematic of "Prose" and "Poetry." Below is the inscription, "Leigh Hunt, born Oct. 19, 1784; died Aug. 28, 1859." The bronze is mounted on a shaped Siena marble slab fixed to the red brick wall. The two memorials, together with the dark green marble dedication tablet placed between them, form a triptych of uncommon interest. The cost of the Leigh Hunt plaque has been paid for by the donor of the building, Mr. Passmore Edwards. The chairman of the vestry, the Rev. Prebendary Snowden, vicar of Hammersmith, opened the proceedings by recounting some salient particulars of the life of Leigh Hunt, and the speaker warmly welcomed Mr. Passmore Edwards, who had, he said, done so much for the good of the parish over which he, as vicar, presided. Mr. Fletcher, eulogising Leigh Hunt and his works, urged that there was nothing to justify the ungenerous charges made against him. It was a very fitting circumstance that so delightful a memorial should be erected to so distinguished a journalist as Leigh Hunt by so famous a journalist as Mr. Passmore Edwards, who had also given them the beautiful building which this tablet adorns. It was not true that Leigh Hunt swerved from his loyalty to Keats, nor that his conduct to Byron was other than that of an honourable man. Both accusations had been fully disproved. The silly slander that the contemptible character of Harold Skimpole in "Bleak House" was a portrait of him, had been indignantly refuted by Dickens himself. Hammersmith might be proud that Leigh Hunt once dwelt within her borders* and commended there with some of the loftiest spirits of his time, for he was a friend of Shelley, Keats, Dickens, Thackeray, Talfourd, Macaulay, Carlyle, and Lowell. On the motion of Mr. G. A. Payne, chairman of the Library Committee, seconded by Mr. Murray, LL.D., vice-chairman, cordial votes of thanks were accorded to Mr. Fletcher for his oration, and to Mr. Passmore Edwards for his gift. The latter explained that one of his reasons for presenting the memorial was a desire to see justice done to Leigh Hunt, for Lord Rosebery had told him in that building, when he formally opened it last year, that he would not in his speech refer to Leigh Hunt, because he thought him correctly represented by a certain character in "Bleak House." Mr. Passmore Edwards felt sure that when Lord Rosebery and others who held the same view knew the facts, their minds would be disabused.—We hope at an early date to be enabled to give an illustration of both of these tablets by Mr. Frampton. That of Charles Keene was exhibited in the Royal Academy

* No. 16, Rowan-road, now Cornwall-road.

this year. The building itself, of which Mr. Maurice B. Adams is the architect, appeared among our illustrations for March 29, 1895.

COTTAGES, ADBOLTON, NOTTS.

THESE Cottages, of which we give view and plans, are nearing completion for the Right Hon. Earl Manvers. They are built of red bricks, the two front gables above windows being in white cement; the two end-gables in half-timber work. The whole of the outside wood-work will be finished white, excepting half-timber gables and barge-boards, which are coated with carbolineum. The roofs are tiled. Mr. A. R. Calvert, F.S.I., Nottingham, is the architect.

"OWEN STONE."
